About this Study - Organizational Notes

For each chapter of the Mūlamadhyamakakārikā, there are two sections (detailed contents of each follows below):

a) “Summaries, etc.”: This section includes summaries, outlines, commentaries and Batchelor’s “poetic” translation for each chapter of the text.

b) “Kārikā Study”: This section includes versions of the text in Sanskrit, Chinese and Tibetan (1.), a compilation of translations in English (2.), and commentaries (3.).

<td>MAJBA (TOPICAL OUTLINE)</td>
<td>Times New Roman</td>
<td><strong>Source:</strong> Majba Jangchub Tsondru, “Ornament of Reason – The Great Commentary to Nagarjuna’s Root of the Middle Way.” Trans. Dharmachakra Translation Committee, Ithaca, New York: Snow Lion Publications, 2011. <strong>Notes:</strong> The topical outline included in this study is from the Appendix. Mabja was active in the 12th c. and one of the first Tibetan Madhyamaka commentators to rely on Candrakīrti. As the “Ornament of Reason” comes to over 500 pages, it did not seem practical to include it in this study.</td>
<td></td>
</tr>
<tr>
<td>TSONG-KHA-PA (Outline, Explanation, Summary)</td>
<td>Arial</td>
<td><strong>Source:</strong> rJe Tsong Khapa, “Ocean of Reasoning – A Great Commentary on Nagarjuna’s Mūlamadhyamakakārikā.” Trans. Geshe Ngawang Samten &amp; Jay L. Garfield, Oxford &amp; New York: Oxford University Press, 2006. <strong>Notes:</strong> Like Mabja’s work, the “Ocean of Reasoning” by Tsong Khapa (1357-1419) comes to over 500 pages. Included in this study are three sections on each chapter from the commentary: the Outline, Explanation and Summary. This is just to give a general sense of the structure and approach of Tsong Khapa’s commentary (which seems to follow the structure of Mabja’s topical outline above).</td>

<td><strong>Source:</strong> Khenpo Tsurtrim Gyamtso, “The Sun of Wisdom: Teachings on the Noble Nagarjuna’s Fundamental Wisdom of the Middle Way.” Trans. Ari Goldfield, Boston &amp; London: Shambala, 2003. <strong>Notes:</strong> Includes selected verses which are also in the Kārikā Study.</td>
<td></td>
</tr>
</tbody>
</table>

Note: the above commentaries, outlines and summaries are included for each of the 27 chapters of the text, but only some are included in the “Introductions and Overviews” and “Dedication” sections.
**Supplemental Introductions and Commentaries**

This includes introductions, essays or commentaries on the work as a whole, as well as on selected Chapters.

**Kalupahana** – This section includes the remaining section of the Introduction (with the exception of “Nagarjuna’s Mission” and “Structure of the Karika” sections included in the “Overview of the Whole Text” section above) from: David Kalupahana, “MūlaMadhyamakakārikā of Nāgārjuna.” Delhi: Motilal Banarsidass, 1991.

**Westerhoff** – “Supplemental Introductions” includes Chapters 1, 2, 3, 4 and 10 from: Jan Westerhoff, “Nagarjuna’s Madhyamaka – A Philosophical Introduction.” Oxford and New York: Oxford University Press, 2009. “Supplemental Commentaries” to MMK Chapters I, II, III, XIII & XVIII include (in order) Chapters 5, 6, 8, 9 and 7 of “Nagarjuna’s Madhyamaka.”

b) “Kārikā Study”

</tbody>
</table>

Generally, the first column of the English translations are translations from the Sanskrit. The translations from the Sanskrit do, however, spill over into the second column frequently. The second column generally starts with the translation from the Chinese by Bocking, then includes the translations from the Tibetan. Generally, I kept the verse enumerations from the source texts, and as the editions of the text are not all in complete agreement, the enumerations sometimes vary within a single kārikā (for example, Kārikā III.7 is not included in all Sanskrit editions).

The fonts for a given author are consistent in attempt to connect the translation with the respective commentary.

In the Study, after the name of the translator, there is an indication of what language the translation was made from: (Skt): Translated from Sanskrit. (Ch): Translated from Chinese. (Tb): Translated from Tibetan. (paraphrase): A version based on other translations into English.

Introductions and Overviews
CHAPTER COMMENTARIES, SUMMARIES, OUTLINES

Introductions / Overviews

MAJBA (TOPICAL OUTLINE)

Ornament of Reason

1. Preliminary Discussion  2. The Meaning of the Scripture

1. The Meaning of the Opening Lines  2. The Meaning of the Main Part of the Treatise  3. The Meaning of the Postscript

1. Ascertaining the Meaning of the Chapters  2. Explaining the Progression of the Text

Chapter One: Analysis of Conditions
Chapter Two: Analysis of Going and Coming
Chapter Three: Analysis of the Sense Sources
Chapter Four: Analysis of the Aggregates
Chapter Five: Analysis of the Elements
Chapter Six: Analysis of Desire and the Desirous One
Chapter Seven: Analysis of the Characteristics of the Conditioned
Chapter Eight: Analysis of Action and Agent
Chapter Nine: Analysis of Prior Existence
Chapter Ten: Analysis of Fire and Fuel
Chapter Eleven: Analysis of Beginnings and Ends
Chapter Twelve: Analysis of Suffering
Chapter Thirteen: Analysis of the Conditioned
Chapter Fourteen: Analysis of Contact
Chapter Fifteen: Analysis of Nature
Chapter Sixteen: Analysis of Bondage and Liberation
Chapter Seventeen: Analysis of Action and Its Results
Chapter Eighteen: Analysis of Self and Phenomena
Chapter Nineteen: Analysis of Time
Chapter Twenty: Analysis of the Assembly
Chapter Twenty-one: Analysis of Arising and Disintegration
Chapter Twenty-two: Analysis of the Thus-Gone
Chapter Twenty-three: Analysis of Error
Chapter Twenty-four: Analysis of the Noble Truths
Chapter Twenty-five: Analysis of the Transcendence of Suffering
Chapter Twenty-six: Analysis of Dependent Origination
Chapter Twenty-seven: Analysis of Views
The Relationship between the 27 Analyses as Explained in the Ornament of Reason

1. The primary distinctive qualities of dependent origination: absence of cessation and the rest of the eight factors
   I. Analysis of Conditions
      II. Analysis of Going and Coming

2. Subsidiary distinctive qualities of dependent origination
   1. Analysis of the Noble Truths
      XXIV. Analysis of the Noble Truths
      XXV. Analysis of the Transcendence of Suffering

3. Reply to the charge of absurdity
   1. Showing that dependent origination is empty of the nature of aggregates, elements, and sense sources, and thus empty of the self of phenomena
   2. Showing that dependent origination is empty of a self in the form of a person that appropriates the aggregates

4. Presenting the basis for these distinctions, the dependent origination of affliction and purification
   1. Refuting the natural establishment of the essence of an individual
   2. Refuting the arguments advanced to prove the natural existence of such a self

5. The result of realizing this distinctive dependent origination
   1. Refuting the natural establishment of the essence of things as such
   2. Refuting the arguments advanced to prove this natural establishment
   3. Presenting, as a mere convention, the Middle Way's own account of the real nature of things
      XVIII. Analysis of Self and Phenomena
      XXIII. Analysis of Error

XXVI. Analysis of Dependent Origination

XXVII. Analysis of Views

XXIX. Analysis of Prior Existence

X. Analysis of Fire and Fuel

XI. Analysis of Beginnings and Ends

XII. Analysis of Suffering

VI. Analysis of Desire and the Desirable One

VII. Analysis of the Characteristics of the Conditioned

VIII. Analysis of Action and Agent

XIII. Analysis of the Conditioned

XIV. Analysis of Contract

XV. Analysis of Nature

XVI. Analysis of Bondage and Liberation

XVII. Analysis of Action and its Results

XIX. Analysis of Time

XX. Analysis of the Assembly

XXI. Analysis of Arising and Disintegration

XXII. Analysis of the Thus-Gone

2. Disproving that affliction is naturally established as its cause
1. The Meaning of the Opening Lines

1. The purpose of paying homage to the teacher at the outset of the treatise
   1. The Buddha’s essence 2. The Buddha’s superiority 3. The reasons for this superiority
   1. The nature of this teaching, that is, dependent origination 2. How this teaching makes him the true teacher 3. The purpose of this teaching
   1. The basis for distinctions 2. The distinctive qualities of dependent origination 3. A consideration of the difference between the basis and its qualities
   1. The literal meaning of the term “dependent origination” 2. What this term refers to
      1. Its defining characteristic 2. The bearers of that characteristic 1. Identifying the essence of each of these eight 2. Contemplating the way in which these qualities are definitively numbered 3. Deflecting any critique that their sequence is unreasonable
   1. The purpose of stating the four related elements at the beginning of the treatise 2. A summary of the four
      1. Identification of the four related elements as contained in the meaning of the opening statement 2. A consideration of the manner in which this statement presents these four 3. A contemplation of the reasons why the elements are definitively numbered at four
   1. The words and their meaning
Nagarjuna’s Mission

Nagarjuna, who lived at a time when the Theravada-Mahayana conflict had not degenerated to the level that is presented in the Saddharmapundarika, therefore had an already different mission. It was indeed not the least different from the mission that lay before Moggaliputtatissa, to expose the untenability of certain heretical views that were gradually becoming popular in the Buddhist tradition. A careful reading of the Karika will reveal the fact that Nagarjuna had all the help he needed to achieve this task. As mentioned before, even after the transference of the Pali canon to Sri Lanka, the discourses and the Abhidharma texts survived in India. Thus the discourses of the Buddha as well as the tradition of the disciples (sravaka) were available to Nagarjuna. The
humility with which Nagarjuna bows down to the Buddha and the respect with which he treats the Buddha's disciples (srama\-\-ka) are in complete contrast to the unsympathetic attitude of the later Mahayanists toward the earlier Buddhist tradition.

In the following analysis of the Karika, it will be shown that Nagarjuna attempted to discredit heterodox views, especially those of the Sarvastivadins and the Sautrantikas, and establish the non-substantiality of all dharmas (Chapters III- XV) as well as the non-substantiality of pudgala (Chapters XVI- XXI) and thereafter to explicate the positive doctrines of the Buddha as embodied in the early discourses like the Kaccayana\-\-gotta\-\-sutta. The present analysis is, therefore, contrary to the more popular interpretation of Nagarjuna espoused by commentators like Candra\-\-kirti who emphasized the reductio ad absurdum (prasangika) method. It will be more sympathetic to the interpretations offered by Nagarjuna's disciples like Bhavaviveka and the more positive thinkers of the Madhyamika school. While highlighting the ingenuity and philosophical maturity of Nagarjuna, the present analysis will at the same time be unsympathetic toward the myth that Nagarjuna was a second Buddha.

Structure of the Karika

Selections from the works of a major philosopher belonging to a tradition may be helpful in introducing that tradition but not in providing a complete view of that philosopher's thought. The reason is that when a philosopher presents his ideas in some form, he feels that everything he has said in that work is relevant to his thought. If anything that he has said is irrelevant to what he proposes to convey to his readers, he would be not only wasting his time, but also the reader's.

Attempts have often been made by modern scholars to pick out selections or chapters from the works of eminent philosophers of the East, hoping thereby to provide a complete and accurate picture of their ideas. Sometimes they are considered to be essential secitons or chapters, the implication being that the rest is inessential. 63 This undoubtedly has contributed to a great deal of misunderstanding and sometimes deliberate distortion of the author's ideas. Considering the unsatisfactoriness of such a method, the present analysis of Nagarjuna's thought will be presented on the basis of an examination of his Karika taken as a whole, with every word, every verse, and every chapter in it treated as in integral part of that work. This is done in the absence of any concrete evidence that some portions of this work are not by Nagarjuna.

A superficial reading of this work, with 448 verses divided into 27 chapters, could leave the reader with the impression that the text is repetitious. This wrong impression will disappear like a mirage if one keeps in mind the circumstances that led to the complication of this work, the motivation for writing it, the background in which it was written, and the goal that was to be achieved. Such considerations will enable one to see a carefully executed plan or structure in the Karika. In order to highlight this structure, the Karika will be analysed here into four major sections, without changing the sequence either of the individual verses or of the chapters.

Section I

This first section includes Chapters I and II, which deal with the most fundamental doctrines of Buddhism, causation and change. The problem of causation or “dependent arising” is taken up in the first of these. If this were a text written during the Buddha's day, this chapter would undoubtedly have dealt with theories of existence presented by the traditional schools of Indian philosophy advocating the reality of a permanent self (atman) and the Materialist school that denied such a self (an\-\-atman) thereby denying the continuity of the human person as well as his moral responsibility. However, Nagarjuna was living in the second century AD and his problems, as mentioned earlier, were created more by the Sarvastivadins and the Sautrantikas than by the non-Buddhist schools. This is clearly evident from the way in which Nagarjuna begins his first chapter. The lust verse in this chapter refers to four different theories of causation or arming: (i) self-causation, (ii) external causation, (iii) both self- and external causation, and (iv) arising out of a non-cause. After enumerating four such theories, any further explanation would naturally commence with an analysis of the lust of these four theories, self-causation (svata-\-uppatti). Thus, the four types of relations (pratyaya) referred to in the next verse should be taken as examples of the theory of self-causation (svata-\-uppatti), even though the most respected modern interpreter of Nagarjuna, namely T.R.V. Murti, following the footsteps of Candra\-\-kirti, took these four types of causal relations to represent the theory of external causation, and not self-causation.64 He assumed that self-causation was presented by the Hindu schools and external causation was a theory advocated by the early Buddhists only. As explained above, the early Buddhist theory of causation cannot be placed under the category of either self-causation or external causation. Nagarjuna was clearly aware of this and therefore, even though in the first verse he denied the possibility of any one of the four causal theories, in the second verse he recognizes four conditions (pratyaya) without denying them though to make his analysis more comprehensive he denies a fifth condition. The denial comes only in the third verse, but what is important to note
is that it is not a denial of the four conditions (pratayaya) but of the manner in which the condition is considered to be related to the effect. When Nagarjuna said, “The self nature of an existent is not evident in the causal condition, etc.” (Na hi svabhavo bhavanam pratayayadisu vidyate, I. 3), he was not rejecting or denying conditions, but only self-nature (svabhava) that some philosophers were positing in the condition (pratayaya) in order to account for the arising of the effect. This is a quite clear indication that Nagarjuna was not rejecting the Adhidharma theory of conditions but only its interpretation by some of the metaphysicians, in this particular case that of the Sarvastivadins. As pointed out above, there is every evidence that it was the Sarvastivadins who interpreted the theory of conditions (pratayaya) on the basis of a conception of substance (svabhava). In the same verse, Nagarjuna proceeds to deny external causation (parata-utpatti) or, more specifically, the conception of “other nature” (para-bhava) advocated by the Sautrantikas. If this background is kept in mind, the understanding of Nagarjuna’s ideas in the Karika is not as formidable as has been assumed.

Chapter II deals with the problems created not by an empirical theory of change and impermanence (anityata), for that was a fundamental conception of early Buddhism by a more metaphysical theory of change and impermanence based on a logical or even a psychological theory of moments (ksanavada).

Section II

The second section includes thirteen chapters, beginning with an examination of sense faculties (indriya, Chapter III) and ending with an examination of substance (svabhava, Chapter XV). The entire section is an attempt to establish the doctrine of the nonsubstantiality of phenomena (dharma-nairatmya) without having to get rid of any one of the categories such as the aggregates (skandha), spheres of sense (ayatana), and elements (dhatu), all of which were part of the early Buddhist teachings embodied in the discourses as well as in the Abhidharma. Almost all the important subjects dealt with in early Buddhism are taken up, once again not with the intention of rejecting them, but with a determination to rid them of any metaphysical explanation, especially of existence (astiiva) and of nonexistence (nastiiva), implying permanence (sasvata) and annihilation (uccheda) which the Buddha was openly rejecting in the Kaccayananagotta-sutta.

Section III

The third section includes eleven chapters from XVI to XXVI. It is a section that has caused confusion in the minds of many who wrote on Nagarjuna’s thought. First, many of the topics dealt with in the previous section are again analysed here. This gave the impression that the text is repetitive and therefore it is possible to ignore some of its parts when presenting Nagarjuna’s philosophy. For example, the examination of action and agent (karma-karaka) was attempted in Chapter VIII, and a longer chapter (XVII) on the examination of the fruit of action (karma-phala) is included in this section. Secondly, this particular chapter (XVII) deals with the doctrine of karma in a more positive way, asserting the existence of a more appropriate view than the one criticized at the beginning of the chapter. Such an assertion seems to go against not only the doctrine of emptiness (suyata), as it is generally understood by modern scholars, but also the view that neither the Buddha nor Nagarjuna had a view to propound.

However, reading the eleven chapters one cannot help coming to the conclusion that they were intended to establish the non-substantiality of the individual (pudgala-nairatmya) but not to eliminate the conception of an individual or person altogether. The conception of the individual involves the problems of bondage and freedom (bandhana-moksa) and, after defining these, five chapters are devoted to the problem of bondage. These five chapters are undoubtedly commentary on a verse that seems to have been extremely popular among the Buddhists and which both Nagarjuna and Vasubandhu were conversant with, for we find the latter composing a whole treatise called Karmasiddhiprakarana.65 This verse is quoted by Candrakirti in his commentary, and runs thus:

Actions are not destroyed even by [the passage of] hundred myriads of aeons. Having reached the harmony of conditions and the proper time, they bear fruits for the human beings.

Na pranasyanti karmani kalpakotisair api, samagrim prapyapi kalam ca phalanti khalu dehinam.66

The denial of a permanent self (atman) by the Buddha prompted his critics to insist that the Buddha could not satisfactorily explain the problem of moral responsibility. The present verse is only a summary of the Buddha’s causal explanation of the doctrine of moral responsibility, not an admission of a permanent and eternal karma. In fact, the determinism that may appear with the reading of the first line, is immediately corrected with the conditionality specified in the second line. Three main topics are dealt with here: the imperishability of karma (avipranasa), the harmony of conditions (samagri) and the appropriate time (kala). It is therefore not surprising to see Nagarjuna inserting two chapters on “harmony” (samagri, XIX) and time (kala XX), after stating the “imperishability” of karma (XVII) and denying the existence of a permanent and eternal “self” (atman, XVIII). To eliminate any one of these
thought is, therefore, highly unwarranted.

After a clarification of the meaning of bondage (bandhana) in the context of a human being who is without a permanent and eternal self and who still continues to wander along experiencing births and deaths, happiness and suffering, Chapter XXII takes up a person who has attained freedom (moksa), who has “thus gone” (tathagata) without having to wander along as a person in bondage. No other issue in Buddhist thought has been as misunderstood and misinterpreted, not only by the non-Buddhists, but also by the Buddhists themselves, as the conception of tathagata. Probably for this reason, Nagarjuna felt the need to begin his discussion of freedom with an examination of the conception of tathagata. It will be shown that Nagarjuna’s analysis follows exactly the method of analysis given by the Buddha. The chapter that follows explains the reasons for such misconceptions (viparyasa, XXIII).

Modern scholarship on Nagarjuna has emphasized the conception of two truths to the complete neglect of his explanation of the four truths as enunciated by the Buddha. It will be shown that the two truths in Nagarjuna are not an improvement on the four noble truths, nor a special insight on the part of Nagarjuna, but an understanding of a doctrine that is already clearly expressed in the early discourses. This lengthy chapter (XXIV) concludes with a recognition of the four noble truths and the doctrine of dependent arising that is the foundation of the four noble truths and the doctrine of emptiness as way of speaking about the Tao, so Western translators compare Nagarjuna to figures from their own culture, and emptiness to corresponding ideas in their own preferred philosophical, religious or cultural discourse.

No matter what style, tone or terminology is used, the translator seeks to persuade the reader of his or her authority by giving an impression of a detached, informed and reasonable objectivity. Yet ‘beneath every clear and confident statement on the printed page lie conscious and unconscious layers of unstated beliefs, intuitions, preferences, antipathies, uncertainties and desires.

Work on this book started in the early 1990’s with a study of Tsongkha’s commentary on the chapter Awakening (MMK 24) in his An Ocean of Reason: A Great Exposition of the Root Text Verses from the Center, written in 1407. This refamiliarized me with both the philosophical tradition of the Tibetan Geluk order (in which I had been trained) and the work of the Indian Centrist commentator Chandrakirti on which it is based.

In 1996 I began a systematic translation of the Tibetan text of Verses from the Center, I consulted two editions of

**BATCHelor (Poetic “Translation”)**

[Afterword]

Every translation of a classical text is governed by two imperatives: to be faithful to the original, and also to make it intelligible to readers other than those for whom it was written. This tension becomes all the more apparent when working with a text that is not only ancient but from a culture other than one’s own. Such a translation cannot but be an interpretation. Just as the Chinese saw Nagarjuna as a kind of Taoist sage, and emptiness as way of speaking about the Tao, so Western translators compare Nagarjuna to figures from their own culture, and emptiness to corresponding ideas in their own preferred philosophical, religious or cultural discourse.

No matter what style, tone or terminology is used, the translator seeks to persuade the reader of his or her authority by giving an impression of a detached, informed and reasonable objectivity. Yet ‘beneath every clear and confident statement on the printed page lie conscious and unconscious layers of unstated beliefs, intuitions, preferences, antipathies, uncertainties and desires.

Work on this book started in the early 1990’s with a study of Tsongkha’s commentary on the chapter Awakening (MMK 24) in his An Ocean of Reason: A Great Exposition of the Root Text Verses from the Center, written in 1407. This refamiliarized me with both the philosophical tradition of the Tibetan Geluk order (in which I had been trained) and the work of the Indian Centrist commentator Chandrakirti on which it is based.

In 1996 I began a systematic translation of the Tibetan text of Verses from the Center, I consulted two editions of
the Tibetan (Lhalungpa and Woodblock to Laser) and compared them with the text embedded in the prose of Tsongkhapa’s word-by-word commentary. I also read the available English translations from Sanskrit (Streng, Inada and Kalupahana). This enabled me to produce my own edited text of the Tibetan verses, which I translated as literally as possible into English without paying any attention to style. On finishing a chapter, I put the Tibetan aside and treated my literal English translation as the first draft of a poem, which I worked and reworked through numerous drafts until arriving at a text that satisfied me as both consistent with Nagarjuna’s original as well as accessible to a contemporary reader.

In an ideal world, I would also have learned Sanskrit, the language in which the original was composed. By choosing to base my translation on another translation, i.e., the Tibetan, I was conscious of losing the philological proximity with Nagarjuna’s words that a Sanskrit scholar would have had. At the same time I was aware of working with a text that exists as part of a living Buddhist tradition. From an experiential perspective it was important to me that I could hear the text as it would have been spoken by my Tibetan teacher, the late Geshe Rabten. Tibetan tradition understands the nature of a text such as Verses from the Center to be that of speech. The printed copy is merely a record of the spoken word; its value is diminished once the oral tradition in that tongue has died out. Having chosen to emphasize the poetic rather than the philosophical dimension of Verses from the Center, my aim throughout was to be able to hear Nagarjuna’s voice. I tried to capture the playful and disconcerting quality of his logical moves through wordplay, internal rhymes, jarring contrasts, apparent non sequiturs and unexpected echoes of non-Buddhist sources. I was conscious of influences as diverse as those of John Keats, T. S. Eliot and John Lennon on the formation of my Nagarjunian voice. I was not content with a chapter until I could recite it out loud in a way that (to me at least) caught something of the pulse of emptiness.

A central difficulty for many contemporary readers of Nagarjuna’s work is the high degree of abstraction characteristic of Indian Buddhist philosophical writing. I tried to resolve this by making the most of concrete imagery whenever it appeared in the original. Occasionally I introduced a concrete image to help out a passage whenever it appeared in the original. Nagarjuna almost entirely avoids personal pronouns, I tried as much as possible to use the first person “I” as the authorial voice, which enabled me to introduce the second person “you” for the real or hypothetical “other” with whom Nagarjuna is often engaged in dialogue. The recovery of the poetic threads of the text entailed a rigorous editing of the verses, which resulted in an abridged and adapted translation. Lines, verses and sometimes entire sequences of verses were removed or reordered in this process. At times it seemed that either Nagarjuna or perhaps a later hand had interpolated a passage in order to develop a logical or doctrinal point, which a modern writer would probably have chosen to include as a footnote. Some verses were omitted on the grounds of repetition, others because of obscure doctrinal references, and others simply because I could make little or no sense of them. At other times, though, I expanded the text in order to clarify expressions which Nagarjuna uses as a form of technical shorthand. (The five aggregates [skandha], for example, are either listed in full or rendered as “mind and matter.”)

Rather than introducing foreign terms or Buddhist neologisms into the fabric of ordinary speech, I sought a contemporary, idiomatic language in which familiar words arc surreptitiously invested with new meanings. Likewise, instead of insisting on the same English word throughout to translate a particular term in Tibetan/Sanskrit, I chose to vary the translation as much as possible. Dukkha, for example, is translated as “anguish,” “suffering,” “pain,” “misery,” etc. This forced me always to consider what word would work best--both in terms of accuracy and style--in any given context. It was also a recognition of the complex range and nuance of Buddhist terms, for which exact equivalents rarely exist in English. Nonetheless, I consistently translated certain key terms which arc central to Nagarjuna’s vision, such as “emptiness” and “fixation.” Tibetan, Sanskrit and Pali equivalents of key terms are given in the glossary that follows.

Central to the Korean Zen Buddhist tradition in which I trained under the late Kusan Sunim is the practice of a hwadu. A hwadu refers to the central question or dilemma that underpins a koan, i.e., the account of a student’s awakening under the guidance or provocation of a Zen master. One of the most famous hwadu is “No!” (mu)-Chao-chou’s response to the question: does a dog have buddhanature? The twelfth-century Korean Zen master Chinul compares the hwadu “No!” to “a mass of fire; if you approach it, it burns your face.” Nagarjuna’s Verses From the Center often felt to me like an incandescent shout of “No!” to which my translation was but a stammering response. Nagarjuna constantly reminded me of how my choice of words was contingent both on the fallibility of my understanding and the ambivalence of my motives.

Appendix [regarding] Conditions (MMK 1), Combination (MMK 20) and Confusion (MMK 23).
This translation includes twenty-four chapters out of a total of twenty-seven in the original. The three omitted chapters are *Conditions* (MMK I), *Combination* (MMK 20) and *Confusion* (MMK 23), which are translated here. The reason for the omission of these chapters from the main body of the translation is primarily a literary one. I found that their removal restored an organic unity to the unfolding of Nagarjuna’s vision. I felt that these chapters hindered the poetic flow and coherence of the text. In contrast to the other chapters, they also proved more resistant to being rendered in a contemporary and idiomatic style.

_Conditions_, traditionally the opening chapter, is uncharacteristically doctrinaire. It could be a later addition, designed to impress the reader with an unequivocal statement of Nagarjuna’s “position.” Its tone and subject matter are in striking contrast to the immediacy of the chapters that follow: *Walking, Seeing, Body*, etc. *Combination* and *Confusion* are illuminating but lengthy digressions from the trajectory and pace of Nagarjuna’s core inquiry. In terms of content, all three chapters are consistent with the rest of *Verses from the Center*.

**GYAMTSO (COMMENTARY)**

[From the Preface:]

ON HIS TEACHING TOUR of Europe and the United States in 2000, Khenpo Tsultrim Gyamtso Rinpoche chose to explain the noble protector Nagarjuna’s great treatise *The Fundamental Wisdom of the Middle Way* on several occasions. Rinpoche’s style was to select important verses from each chapter as the basis for what in Tibetan is called a chidon, an overview explanation of the entire text. Rinpoche based his teachings on the commentary to the text by Ju Mipham Rinpoche entitled *A Jewel of the Powerful Nagarjuna’s Intention That Perfectly Illuminates the True Nature*. I had the great fortune to serve as Rinpoche’s translator when he gave these teachings.

In response to the many requests from students that Rinpoche’s explanations of *The Fundamental Wisdom of the Middle Way* be published in written form, Rinpoche directed that this book be compiled from the teachings he gave on the text at three different Dharma centers: Tekchen Kyetsal in Spain, Karma Ling in France, and Karme Choling in the United States.

**Introduction**

WHATEVER ACTIVITY WE ENGAGE IN, our motivation is very important. According to the tradition of Mahayana (Great Vehicle) Buddhism, the motivation we should cultivate is bodhichitta—the mind turned toward supreme enlightenment. One way to do so is to think first of our father and mother in this lifetime, and then extend the love and compassion we feel for them to all sentient beings, including even our enemies. It is the case that all sentient beings, including our enemies, have been our own father and mother countless times, and therefore they have been indescribably kind to us countless times. The greatest thing we can do to repay sentient beings’ kindness is to lead them all to the state of complete and perfect enlightenment, the state of buddhahood, and in order to do this, we must listen to, reflect upon, and meditate on the teachings of the genuine Dharma with all the enthusiasm we can muster. This is the supreme motivation of bodhichitta—please give rise to it as a first step whenever you read, reflect on, or meditate upon the teachings in this book.

The topic of this book is the text known as *The Fundamental Wisdom of the Middle Way*, composed by the noble protector Nagarjuna. Nagarjuna is a special teacher in the history of Buddhism. The Buddha himself prophesied that Nagarjuna would be born four hundred years after the Buddha’s own passing and that he would give vast and perfect explanations of the Buddha’s teachings. Nagarjuna fulfilled this prophecy both as a teacher of many students who went on to become great masters themselves and as an author of texts that expound and clarify the meaning of the Buddha’s words. Buddhists and non-Buddhists alike have studied these texts from Nagarjuna’s time to the present.

Nagarjuna’s commentaries form three main collections of texts that explain, respectively, the Buddha’s own three series of teachings known as the three turnings of the wheel of Dharma. Thus, in the set of compositions known as *The Collections of Advice*, Nagarjuna’s focus is the first turning of the wheel. He describes how a human life gives one the invaluable opportunity to practice the Dharma; how this life and everything one knows of and experiences within it are impermanent; how samsara—the cycle of existence in which confused sentient beings endlessly wander from one lifetime to the next—is characterized by constant suffering, in both gross and subtle forms; and how practicing the Dharma leads to the attainment of nirvana, the state of liberation that transcends samsara’s suffering once and for all. This is a brief summary of the teachings the Buddha gave in his first turning of the wheel of Dharma. These are teachings from the perspective that appearances truly exist in just the way they seem to—that the individual, the individual’s past and future lives, the suffering the individual experiences in samsara, and the liberation the individual can attain in nirvana all exist in precisely the way they appear.
In the middle and final turnings of the wheel, the Buddha described the true nature of reality, explaining that the way things appear to be is different from the way they actually are. The Buddha taught that of all the progressively subtle ways of explaining the true nature of reality, the ultimate description one can make is that the true nature of reality is the true nature of mind, the union of luminous clarity and emptiness. It is difficult, however, to understand what “the union of luminous clarity and emptiness” means as an initial statement, and therefore the Buddha taught about the two aspects of emptiness and luminous clarity separately and in great detail in the sutras of the middle and final turnings, respectively. Once students understand what emptiness is, and then what luminous clarity is, they can then much more easily understand how it is that genuine reality is in fact the union of the two.

Nevertheless, the profundity and vastness of the Buddha’s teachings in the sutras make them difficult for ordinary individuals to understand. For this reason, Nagarjuna composed The Six Collections of Reasonings to explain the middle turning’s Sutras of Transcendent Wisdom (the Prajnaparamita Sutras), and The Collection of Seventeen Praises to explain the final turning’s Sutras on the Buddha Nature. From among The Six Collections of Reasonings, the major text is The Fundamental Wisdom of the Middle Way.

WHAT IS THE MIDDLE WAY?

Since it is a commentary on the middle turning of the wheel of Dharma, the main topic of The Fundamental Wisdom of the Middle Way is emptiness. In fact, the terms Middle Way and emptiness are synonyms. Middle Way means that the true nature of the phenomena we experience lies in the middle, between all possible extremes that can be conceived of by the intellect. The true nature of reality cannot be described by any conceptual fabrication, by any conventional term or expression. Thus, it is not existent, not nonexistent, not something, not nothing, not permanent, not extinct; it is not the lack of these things, and it is not even the middle in between them, for that is a conceptually fabricated extreme as well. The true nature of reality transcends all the notions we could ever have of what it might be. This is also the ultimate understanding of the second turning’s description of emptiness. Emptiness ultimately means that genuine reality is empty of any conceptual fabrication that could attempt to describe what it is.

The path leading to the direct realization of this inconceivable, genuine nature of reality begins with gaining certainty in this profound view of emptiness. This is an essential first step because it is not enough just to read the teachings that say, “All phenomena are empty”; the nature of reality is beyond concept,” and, without knowing the reasons these teachings are accurate, to accept them on blind faith alone. If we do, we will not remove our doubts, and our mere opinion that the teachings are valid will not do us any good when these doubts come to the surface. When we gain certainty in the teachings on emptiness, however, then it will be impossible for doubts to arise.

The way that Nagarjuna helps us to gain such certainty is through the use of logical reasoning. This is particularly important for us in this day and age, when academic inquiry, science, and technology are at the forefront. At the dawn of the twenty-first century, people are very well educated and are used to using their intelligence to examine and understand things. Nagarjuna’s method is perfectly in harmony with this—he teaches us how to determine the true nature of reality for ourselves by logically analyzing the things that appear to us. By analyzing in this way we can gain stable certainty in the profound view. Many of Nagarjuna’s logical reasonings negate the true existence of things and conclude that things do not truly exist, that they are empty of inherent nature. This leads some people to think that Nagarjuna’s view is nihilistic—he negates actors, actions, causes and results, the Buddha, and everything else in samsara and nirvana. What then is left of our experience? What is the use or meaning of life if everything is empty in this way?

THE THREE STAGES OF ANALYSIS

It is therefore very important to know that the Buddha taught about the nature of reality in three stages. First, in order to teach his disciples that positive actions lead to happiness and negative actions lead to suffering, the Buddha taught about these things as if they were real. In order to help disciples give rise to renunciation of samsara and longing for nirvana, he taught about samsara’s suffering and nirvana’s liberation from that suffering as if they were real. Furthermore, since all of these teachings depend upon the existence of a self, the Buddha taught about the self, who performs positive and negative actions and experiences their results, who wanders from lifetime to lifetime in samsara, and who can gain the liberation of nirvana, as if it were real. This was the first stage of the teachings, the teachings of the first turning of the wheel, called the stage of no analysis—no analysis of the true nature of the phenomena about which the Buddha taught.

The second stage reflects the fact that once students gain confidence in the law of cause and result and develop renunciation of samsara and longing for nirvana, it is then important that they reverse their clinging to themselves and these phenomena as being truly existent, because this clinging actually prevents them from gaining the liberation for which they strive. In the second stage, therefore, the Buddha taught that phenomena do not truly exist. For example, in the Heart of Wisdom Sutra, the Buddha taught, “There is no eye, no ear, no nose, no tongue, no body, no mind,” and so forth. This second stage is called the stage of slight analysis—the point at which phenomena are
analyzed and found to be lacking in inherent nature, to be empty of any truly existent essence.

In this way, we can see that we need the teachings on nonexistence to help us reverse our clinging to things as being existent. The true nature of reality, however, transcends both the notion of existence and that of nonexistence. Therefore, in the third stage, the stage of thorough analysis, the Buddha taught that we must also give up our clinging to nonexistence if we are to realize the simplicity, the freedom from all conceptual fabrications, that is reality’s ultimate essence.

The Buddha taught these latter two stages in the middle turning of the wheel of Dharma. Of the two philosophical schools whose explanations are based on this middle turning, the Middle Way Autonomy school (Svatantrika Madhyamaka) emphasizes the second stage, that of slight analysis, whereas the Middle Way Consequence school (Prasangika Madhyamaka) emphasizes the third stage, that of thorough analysis. The Autonomy school refutes true existence and asserts emptiness to be the true nature of reality; the Consequence school refutes true existence but does not assert anything in its place, because its proponents recognize that to do so would obscure realization of the freedom from all conceptual fabrications that is the true nature of reality itself.

The Fundamental Wisdom of the Middle Way teaches from the perspectives of both the second and third stages, and therefore both the Autonomy and Consequence schools find their roots in this text. It is important for us to identify what stage a particular teaching in the text is coming from so that we can link it with the explanations of one of these two schools and also understand its intended purpose. If it is a refutation of existence, its purpose is to help us overcome our clinging to things as being real; if it teaches the freedom from all conceptual fabrications, it is intended to help us understand how reality is actually beyond all our concepts of what it might be.

DEPENDENTLY ARISEN MERE APPEARANCES

Understanding these three stages of the Buddha’s teachings highlights one of the main differences between the Middle Way view that Nagarjuna teaches and the view of nihilism. A nihilistic view would have a strong clinging to the notion of nonexistence, whereas in the third stage, the Middle Way explains that the nature of reality transcends both existence and nonexistence.

A nihilistic view would also completely deny the existence of past and future lives, the law of cause and result, the rare and supreme Buddha, Dharma, and Sangha, and so forth. The Middle Way does not fall into that extreme, however, because it does not deny that all these things—in fact all the outer and inner phenomena that compose samsara and nirvana—exist as dependently arisen mere appearances.

The best example to help us understand what this means is the moon that appears on the surface of a pool of water. When all the conditions of a full moon, a cloud-free sky, a clear lake, and a perceiver come together, a moon will vividly appear on the water’s surface, but if just one condition is absent, it will not. Thus, the moon has no independent power to decide to appear—it appears in the water only in dependence upon the coming together of these causes and conditions. At the same time, it appears, however, it is just a mere appearance, because it is empty of true existence—not the slightest atom of a moon can be found anywhere in the water. Thus, the water-moon is a mere appearance of something that is not really there. In the same way, all the phenomena of samsara and nirvana appear due to the coming together of causes and conditions, and at the same time as they appear, precise knowledge (prajna) that analyzes their true nature cannot find the slightest trace of their actual existence. They are appearances that are empty of any substantial essence, just like water-moons, but just like water-moons, their emptiness of essence does not prevent them from appearing vividly when the proper causes and conditions come together. This is the truth of dependent arising, the union of appearance and emptiness that is the essence of the Middle Way view. It frees the Middle Way from the extreme of realism, because it does not superimpose true existence onto the nature of genuine reality where there is none, and from the extreme of nihilism, because it does not deny that things appear due to the coming together of causes and conditions.

Gaining certainty in this view is incredibly beneficial, because such certainty helps us to begin to eradicate the root cause of our suffering—our confused tendency to cling to things as being truly existent. As a result of thinking that things truly exist, we become attached to things we like, averse to things we do not like, and stupidly indifferent to everything else. Such experiences of attachment, aversion, and stupidity are called the mental afflictions (kleshas), and when we come under their influence, our minds become agitated and we accumulate karma, meaning that we think confused thoughts and perform confused actions in a constant attempt to get the things we like and avoid the things we dislike. The only result, however, of all our confused struggles to gain happiness and avoid suffering is to become further enmeshed in the mental afflictions, in hope and fear, and in the suffering of losing or not getting what we like and of meeting up with what we do not wish for.

If, however, we can see that things are not truly real—that they are mere appearances whose true nature is beyond all concepts of what it might be—then our experience of both good and bad events in life will be open, spacious, and relaxed. When something good happens, we will be able to enjoy it in a relaxed way, free of clinging to it and free of the fear of it departing. When something bad happens, if we
recognize its true nature, we will be relaxed within it and our minds will be undisturbed. In short, realizing the true nature of reality brings inner peace—genuine happiness and ease that outer conditions cannot disturb. As the lord of yogis Milarepa describes it in a vajra song of realization called An Authentic Portrait of the Middle Way, also included in this book, appearance-emptiness is “a union vast and spacious,” and realizing that this is the true nature of reality brings the experience of genuine reality’s natural openness and spaciousness. The enlightened masters of the past have all described this experience of realization in precisely this way, and some of their songs appear in this book to give you an idea of what this direct experience of reality is like. By gaining certainty in emptiness, instead of accumulating the causes of suffering, you will accumulate the causes of gaining this very realization that Milarepa and all other enlightened masters have achieved.

Our current confusion and the prospects of liberation from it are illustrated well by the example of dreams. When we dream and do not know that we are dreaming, all the forms, sounds, smells, tastes, and tactile sensations we seem to perceive on the outside, and all the thoughts we seem to have on the inside, appear to be real; we believe they are real, and we have further experiences that seem to confirm to us that they are real. As a result, we experience the turmoil of attachment to things in the dream that we find pleasing, and realizing that this is the true nature of reality brings the experience of genuine reality’s natural openness and spaciousness. The enlightened masters of the past have all described this experience of realization in precisely this way, and some of their songs appear in this book to give you an idea of what this direct experience of reality is like. By gaining certainty in emptiness, instead of accumulating the causes of suffering, you will accumulate the causes of gaining this very realization that Milarepa and all other enlightened masters have achieved.

How should we cultivate compassion? From among the many different methods the Buddha taught, all of which are important for us to train in, the one that is particularly connected with the view of the Middle Way is this: Understanding that reality is appearance-emptiness, one cultivates compassion for those sentient beings who suffer because they mistakenly believe that appearances, particularly appearances of suffering, are truly existent. As Milarepa once sang, “I see this life to be like an illusion and a dream, and I cultivate compassion for sentient beings who do not realize this.”

This is the answer to the question raised above: From the perspective of the Middle Way’s teachings on emptiness, what is the meaning or purpose of life? The purpose is to follow Milarepa’s example by, first, continually training in the view that sees that all our experiences in this life are dependently arisen mere appearances whose true nature is beyond conceptual fabrications, is open, spacious, and relaxed; and second, cultivating compassion for all sentient beings who suffer as a result of not realizing that this is the genuine nature of reality. We should do whatever we can to help others on a conventional level, for example, by practicing generosity toward those in need and taking care of those who are sick; and at the same time we should continually make aspiration prayers that in the future we will be able to help all sentient beings realize the true nature of reality, because when they do so it will most definitely liberate them from samsara’s ocean of suffering once and for all. In order to help them gain this realization that is the one certain antidote for suffering and the one certain bestower of happiness, we need to gain it ourselves, which we do by studying, reflecting, and meditating upon the teachings on the true nature of reality contained in such extraordinary texts as The Fundamental Wisdom of the Middle Way. Dedicating ourselves in this way to training on the
Mahayana path of wisdom and compassion together, whose fruition is the attainment of buddhahood, and which is of infinite benefit to limitless sentient beings, is the greatest purpose we could ever have.

ABOUT THIS BOOK

The Fundamental Wisdom of the Middle Way is composed of twenty-seven chapters. Each is itself a commentary on a different statement made by the Buddha in the sutras comprising the second turning of the wheel of Dharma. Nagarjuna proves the validity of the Buddha’s teachings with logical reasoning. The chapters also answer the successive arguments put to Nagarjuna by those who believed that things truly exist. In each chapter, Nagarjuna would successfully refute one such argument; his opponents would then come up with another argument that they thought proved that things were real, and Nagarjuna would refute that, and so on—that is why there are twenty-seven chapters! They are all very beneficial to us because they help us to overcome our own doubts, the same doubts that Nagarjuna’s opponents had.

Some of the chapters are long and the logical reasonings they present are quite detailed. This book examines the most important verses from each chapter. It is necessary to proceed in this way because very few people today have the time to study the entire text. People in modern times need concise Dharma teachings that are profound, easily understandable, and readily applicable to daily life. By reading, contemplating, and meditating on the teachings in this book, you will get to the heart of Nagarjuna’s text in a direct way that will greatly enhance your precise knowledge of the genuine nature of reality.

There are similarities from one chapter to the next in the methods of logical inference and reasoning used to help you gain certainty in emptiness. This similarity of method makes it easier for you to gain facility with these logical reasonings, and will also help you to see how wonderfully applicable they are to such a great variety of subjects. By reviewing these same basic reasonings as they apply to different subjects, your familiarity with them will grow and you will gain more and more certainty in their conclusions. Emptiness is the deepest and most subtle topic one could ever attempt to understand, so it is never enough to hear or read teachings on emptiness just once. Rather, we must analyze them again and again, apply them again and again, and continually cultivate familiarity with their profound meaning.

Along these lines, this book also includes other selections of texts that will help to deepen your understanding of emptiness and strengthen your certainty. The first is the Heart of Wisdom Sutra, one of the Buddha’s most concise teachings on emptiness, yet incredibly powerful and profound. This sutra was actually spoken by the great bodhisattva Avalokiteshvara, but since he did so through the power of the Buddha’s blessing, it is considered to be the very speech of the Transcendent Conqueror himself. By analyzing the nature of reality with your intelligence in the way that Nagarjuna describes, you will gain stable certainty in the teachings of this sutra. Furthermore, seeing the similarity between the teachings of the Buddha and those of Nagarjuna will increase your confidence in Nagarjuna’s words.

Also included here are the verses that describe the twenty emptinesses from the text by the glorious Chandrakirti (a great Indian master of the Middle Way Consequence school.) called Entering the Middle Way, itself a commentary on the meaning of Nagarjuna’s Fundamental Wisdom of the Middle Way. Actually, within emptiness itself there are no distinctions between different types of emptiness because emptiness’ true nature transcends all concepts that differentiate between one thing and another. Therefore, from the perspective of genuine reality, emptiness cannot actually be divided into twenty different categories or classifications. When the Buddha taught the twenty emptinesses, however, he did so from the perspective of the twenty different types of phenomena whose various appearances we cling to as being truly existent. Going through the twenty emptinesses helps us to free ourselves from this clinging step by step. The first sixteen emptinesses are the extensive presentation, and these are then summarized into four. Studying Nagarjuna’s reasonings makes the twenty emptinesses easy to understand, and at that point Chandrakirti’s verses will be a great help to your meditation practice. You can use these verses to practice analytical meditation by reciting the verses describing a particular emptiness and using the logical reasonings Nagarjuna presents to help you come to certainty in the verses’ meaning, and then practice resting meditation by simply resting in that certainty that your analysis has produced. You can repeat this process as many times as you like. Machig Labdron, the greatest woman practitioner in the history of Tibet, taught her students to meditate on the twenty emptinesses in this way as a method to help them realize prajnaparamita, the transcendent wisdom that realizes emptiness, that is called the Great Mother of all enlightened beings.

Finally, as mentioned earlier, this book includes the vajra song of the lord of yogis Milarepa called An Authentic Portrait of the Middle Way. This is one of Milarepa’s most important songs because it teaches from the common perspective of the Autonomy and Consequence schools’ views. If studying this great text by Nagarjuna, the basis of the Middle Way, leads you to wonder about the Kagyu tradition’s particular perspective on these matters, you will find the answer by referring to this song of Milarepa, one of the founders of the Kagyu lineage. An Authentic Portrait of the Middle Way is a short song, but it contains a meaning that is profound and vast. It teaches that all of the phenomena of samsara and nirvana do not truly exist and yet they still appear—there is a mere appearance of things, and
that appearance is the union of appearance and emptiness. Therefore, it is very helpful to read or sing this song, to memorize it, and to meditate on its meaning. That will be a very good connection for you to make with the profound view of the lineage and the one who realized it perfectly, Milarepa.

Milarepa was the one yogi in the history of Tibet who was universally acknowledged to have attained buddhahood in a single life. If you have faith in him, then singing or reciting his Authentic Portrait as you study Nagarjuna’s teachings will be of great benefit, because it will help you to overcome your fear of emptiness. If you already have certainty in emptiness, then singing the songs about emptiness that were sung by the realized masters will cause your certainty to grow greater and greater.

In general, all the verses in this book are excellent supports for developing your precise knowledge of genuine reality through study, reflection, and meditation. You should recite them as much as possible, memorize them, and reflect on them until doubt-free certainty in their meaning arises within. Then you should recall their meaning again and again, to keep your understanding fresh and stable. Whenever you have time, use them as the support for the practices of analytical and resting meditation. If you do all of this, it is certain that the sun of wisdom will dawn within you, to the immeasurable benefit of yourselves and others.
Supplemental Introductions

SPRUNG’S INTRODUCTION

(excerpts from LUCID EXPOSITION of the MIDDLE WAY – source of the CANDRAKĪRTI COMMENTARY)

Omissions and abridgements

Ten chapters of the Prasannapada’s twenty-seven are not included in this translation. Perhaps my energies ebbed, but it seemed to me that the text is both formally and substantially repetitive in such degree that it should be easily possible to present all facets of the middle way philosophy in the seventeen chapters which were selected for translation.

The only passages omitted from the chapters translated consist of Buddhist scriptures - sutras - which Candrakirti quotes and which bestrew an otherwise clean and precise commentary. This procedure will seem a sacrilege to many and an impropriety to others. I decided, with a view to presenting as closely knit and persuasive an English text as possible, to omit those quotations from the Buddhist scriptures, whether short or long, which in my view slowed and complicated the flow of Candrakirti’s thought for the English language reader. The sutras Candrakirti quotes, do not, with only rare exceptions, clarify or advance his argument in any way. With virtually no exceptions the first sentence of the commentary which follows a sutra explicitly and unmistakably picks up the argument at precisely the point it had reached immediately before the quotation. This, it seems to me, tells us quite clearly that the scriptural quotations do not contain material indispensable to establishing the point at issue. They do, of course, often bring illustrative material of interest and value for the contemporary reader; where I found this to be so they have not been omitted. At some points in the text the quoted sutras accumulate at a disturbing rate: the fact that some are not found in the Tibetan translation lends weight to the possibility that later hands than Candrakirti’s may have been at work. The purpose of the elaborate and often too weighty embellishments from the Mahayana scriptures is clearly to generate credence for the Madhyamika understanding of Buddhism. This understandable device was probably essential to Candrakirti’s purpose when we reflect on the almost heretical character of much of Nagarjuna’s thinking. It mayor may not have been effective in this sense, but in any case it is irrelevant to the contemporary reader - unless he is interested in sectarian controversy. The philosophy of the middle way will establish itself on its own merits, or fail to do so, quite without regard to its Buddhist orthodoxy. The only remaining reason for not omitting any of the quoted sutras would be to contribute to the study of extant Buddhist literature of the seventh century AD. But as students of Buddhism can use the Sanskrit text this would hardly justify detracting from the economy of the English translation.

Further, some passages have been abridged. Except for the lengthy, rambling account of the Buddhist soteriological path given at 479.1 to 487.4, an account which is effectively re-stated in brief by Candrakirti himself subsequently, and which is thus of no interest for the rising pitch of the attack on Nagarjuna developing at just that point, all the passages abridged are in the first chapter of the translation. They are, without exception I believe, concerned with Candrakirti’s controversy with Bhavaviveka, his rival commentator within the Madhyamika school, or with his support of Buddhapalita, a commentator he attempts to follow, or else with traditional arguments of the Samkhya school having to do with causation. These controversies are important, obviously. Yet to place them with all their meticulous, Indian love of syllogistic detail, in what is otherwise a finely targeted introduction to the entire Prasannapada, however natural they were to Candrakirti’s contemporaries, is to make access to the work for contemporary readers difficult and discouraging. The abridged translation of such passages, it is hoped, contains the essential point of the argument being given and in this way permits the forward movement of thought without gap or soft spot.

Table 1 lists all passages abridged or omitted.

Correlation of chapters in the text and in the translation

The lengthy and unfocussed first chapter of the Sanskrit is so unmistakably composed of discrete sections that we must suspect careless editing some time before the extant manuscripts came into being. This is especially so as all other chapters are structured with nothing less than an artistic sense of theme development. With a view to presenting the work in appropriate contemporary form it was important, in the first place, to separate out the middle section (58.14 to 76) which begins and ends without any internal relation to the commentary preceding and following it. This is the controversy With the Buddhist opponent, either Dignaga or Bhavaviveka, and forms Chapter II of the translation. From p. 76 to the end of the first chapter of the Sanskrit the text is a normal commentary on Nagarjuna’s karikas concerned with causal conditions and is Chapter III of the translation. The opening sections of the first chapter of the Sanskrit are Candrakirti’s introduction to the Prasannapada as a whole and as a major work in Buddhist philosophy. In these sections Candrakirti sets Nagarjuna’s thought in historical perspective, singles out its central theme and uses the first karika as a vehicle to raise the critical questions concerning Madhyamika as a school of Buddhism and as a philosophical method. These first sections, which close with the words ‘in the remaining chapters’ and so appear to have been, at one time, an introductory chapter in their own right, form Chapter I of the translation.

Table 2 shows how the chapter numbers of the translation relate to the chapter numbers of the original.

The Thought of the Middle Way:
Translator’s Introduction

The work whose essential and major portions are presented here in translation from the Sanskrit is, in form, and in the Buddhist tradition, a commentary on an earlier treatise, but in substance and for Western readers, it is, in its own right, a philosophical work of originality and rigor. The author, Candrakirti, a Buddhist monk writing probably during the first quarter of the seventh century AD, undertakes to expound the thought of Nagarjuna, himself a Buddhist monk, one great in legend and performance, who had, probably in the second century AD, with a lion’s roar second only to that of Buddha, flung the philosophy of the ‘middle way’ at his receptive, dumbfounded, and outraged contemporaries. In his treatise, which comes to us without a title but which is referred to as a Treatise on the Middle Way (Madhyamakasstra), or Verses on the Principles of the Middle Way (Mulamadhyamakakarikas), Nagarjuna, generally agreed, whether grudgingly or admiringly, to be the acutest intellect in Buddhist history, thinks his way relentlessly through to the conclusions he found implicit in Buddha’s promise of freedom (nirvana) for all beings. Gathering into rigorous thought some of the spiritual currents of his time in India (and not merely among Buddhists) he became the founder of the Madhyamika school of Buddhism - the school of the middle way - and made it impossible for Buddhist religious and philosophical thinking ever again to turn back to earlier conceptions. Nagarjuna marks, for philosophy, the historical realization of the later phase of Buddhism known as the Mahayana? After Nagarjuna some form of Mahayana was irrevocable.

Four or five hundred years later a monk, presumably resident in the then, and today even in its ruins still, fabulous university at Nalanda in northern India, undertook to expound and defend the terse and many-faceted verses of Nagarjuna. Disputes had naturally arisen among Nagarjuna’s Madhyamika followers concerning their interpretation and there had been earlier commentators, Buddhapalita and Bhavaviveka being the best known; Candrakirti, so far as we know the last to deal exhaustively with Nagarjuna’s treatise, claimed that his exposition was prasannapada - clear-worded, or lucid, or serene -- and it is commonly known by that Sanskrit designation. Nagarjuna’s work ran to some 450 couplets, which, printed consecutively, might fill 65 or 70 pages; the Prasannapada in its European edition runs to nearly 600 pages; the difference is Candrakirti’s own work. In what ways Candrakirti might differ from his master - in how far we should attempt to free Nagarjuna from his commentator’s embrace -, is an important question and one so difficult that no one has as yet tried his hand at it. This introduction and the footnotes throughout the translation treat the Prasannapada as a homogeneous work and ignore the problem. For the contemporary reader, whose interest is in the relevance of the thought developed and not in the history of Buddhism, it is a matter which may be overlooked.

The invocation to the Prasannapada, the body of literature from which quotations are drawn in every chapter, and Buddha’s easy coming and going from page to page throughout the work, leave us in no doubt about its cultural origins and about the faith - philosophical and religious - of the author. It is, indeed, a key work in the development of Buddhist thought - and a bright jewel in the rich crown of Indian philosophy. It is presented here, however, not primarily as a contribution to Buddhist studies or to the history of Indian philosophy, though it cannot of course be separated from these concerns, but as a work relevant to the most vital problems of philosophy as these engage thinkers of our own time, whatever their language and cultural background. Its thought is rigorous, fresh and often disconcertingly contemporary. If we can treat the details of the historical matrix of the Prasannapada with the tolerance we exercise toward ancient and medieval Western philosophical writing, there should be no insuperable difficulty in seeing its incisive relevance to the questions now obsessing us in the West. That this is possible is the conviction behind this translation as it is behind the approach to philosophical and religious thought often calling itself comparative philosophy, or comparative thought. Those who have penetrated even a short way into Sanskrit and Chinese find that the great questions which frame the religious sense and the intellectual wonder of these cultures are, however different from those of Greece and Europe, still indefeasibly cognate with them so that we can move from one tradition to another without ever leaving the human scene. If this were not so then works like the Prasannapada would be of antiquarian interest only.

Madhyamika thought has been virulently controversial from the beginning, arousing misunderstanding, disbelief and outrage in roughly equal measure. Classical Indian opponents frequently repudiated it as nihilist, as did E. Burnouf, the first European scholar to study the Prasannapada when it arrived in Europe in manuscript form from Nepal about the middle of the nineteenth century. Burnouf pronounced it ‘nihilisme scholastique’ and suggested that Hindu opponents of Buddhism could not do better than adopt its negative arguments. Madhyamika does deny our most deeply rooted intellectual and visceral habits, holding that nothing, whether metaphysical or everyday, can be known in an unequivocal sense; holding that, hence, measured by knowledge, there is no difference between truth and falsehood, that no one, including all the Buddhas, has ever uttered one true word, that all conceptions, including that of an enlightened human being (buddha) fall short of the truth.

A century ago Europeans and Americans had, within their tradition, no way of comprehending such seeming nonsense. Today, thanks to the crumbling of some traditional
habits of thought and to the pioneering work of some Western philosophers - Nietzsche, Heidegger and Wittgenstein to mention the best known - we can attempt once again and in fresh terms to learn what we may from Nagarjuna and his school about the puzzlements and conundrums of human existence. Nietzsche attacked the capacity of human reason to yield knowledge much as Nagarjuna had done, if not quite so thoroughly, and was the first of the Europeans to suspect that the reality of a human being did not lie in his individuality understood as ego. Heidegger has tried to think his way in under the traditional conceptions of the self-contained subject and an objective world and so to understand truth as trans-objective. Wittgenstein has labored to show that language is not cognitive in the accepted sense, but functions as an integral element in complex human situations. None of these ideas will be strange to Madhyamika and, I believe, none of the ideas of Madhyamika will any longer be strange to us - whatever we may think about their tenability.

The first phase of the thought of the Prasannapada

The Prasannapada remains, for all this, a work of formidable strangeness, unlikely to yield its most interesting insights easily or swiftly. There is no preferred way of taking it up. The great chapters are those on ‘Self-Existence’ (XIII), ‘Self and the Way Things Really Are’ (XIV), ‘The Four Buddhist Truths’ (in substance about the absence of being in things and the two levels of truth) (XVIII), and ‘Nirvana’ (XIX). The key to what may otherwise be persistent bafflement is given in the first chapter, ‘The Concern, Method and Assumptions of the Middle Way Philosophy’. This is Candrakirti’s introduction to the commentary as a whole and is a statement of his understanding of Nagarjuna’s thought. None of the other chapters will make good sense without it, and yet it will not make good sense until its application has been tested in the major chapters.

There may or may not be a dramatic structure in the Prasannapada, but the investigation proceeds, with some zigzagging, through several discernible stages. The first chapter explains and defends Candrakirti’s understanding of Nagarjuna’s purpose and the principles of his procedure. This purpose (p. 33) is to give a fresh interpretation of the Buddhist term ‘dependent origination’ in furtherance of the enlightenment of all beings. Dependent origination will come to mean the absence of both being and non-being in particular things (sunyata); sunyata will be understood as the true nature of things which cannot be expressed in assertions making cognitive claims but can only be realized in the life of an enlightened being, which is nirvana. Nagarjuna proceeds, so Candrakirti maintains, without making a single claim to knowledge (p. 37), but simply by persuading those who do make such claims, whether rival Buddhists or spokesmen for the Hindu schools of philosophy, that nothing they say is, in the end, intelligible (p. 37). He shows that every position taken up, every view (drsti) held, entails claims that are either self-contradictory (pp. 37-9), or false in the face of everyday experience, or incompatible with the possibility of enlightenment - a possibility which neither Nagarjuna nor Candrakirti ever questions and which, therefore, serves as a devastating condemnation of inadequate philosophy.

Following this general introduction by Candrakirti, Nagarjuna’s own inquiry moves through what may be seen as two phases. In the first phase he examines a series of concepts and theories advanced to establish everyday experience on an intelligible and acceptable basis. These concepts and theories are for the most part Buddhist and yet include all the metaphysical possibilities known at that time in India. Causality, the first and most fundamental way of bringing order into experience, is found to be unintelligible (Chapter III), because it presupposes effective entities which, on examination, prove to have merely nominal, not effective, status. Then motion, an assumption no less basic and indispensable, is taken up and dropped in a hopelessly shattered state (Chapter IV); motion cannot be conceived separately from the object or person moving (for then what would move?) nor these from motion (for then how could they be in motion?). In rapid and ruthless succession other possibilities of understanding experience are rejected: perception is unintelligible (Chapter V) because an agent cannot be related to an activity; perceived objects cannot be understood as external and material objects cannot be understood as perceived (Chapter VI); ordering the world into things with attributes is fictitious because neither thing nor attribute makes sense without the other (Chapter VII); affective involvement of persons with people and things is a puzzle because the affections - desire, hatred and so on - are inconceivable without the affected person who in turn is meaningless apart from the inconceivable affection (Chapter VIII); a subject of perception apart from the activity of perceiving is impossible otherwise one could be a perceiver without bothering to perceive (Chapter IX); persons and their actions and any other relation of agent and product are equally fictitious because to be an agent entails the activity of agency and this makes nonsense out of both concepts (Chapter X). This series of enquiries into the possibilities of ordering a world is concluded by a treatment of the ungraspability of all process, using fire and fuel as the paradigm (Chapter XI). The rigor and imaginativeness of this last Investigation is matched in the entire work only by the enquiry into motion and rest. Though fire is accepted as obvious in ordinary experience, we cannot think the relationship of what is burning (fuel) and the burning of it (fire). The unflamed process is overlayed and falsified by the concepts of ‘fuel’ and ‘fire’.

Up to this point Nagarjuna and Candrakirti have attempted to invalidate, not to say shatter, any or all sets of concepts designed to give an Intelligible account of the everyday world. The first phase of the enquiry is rounded off
with a summary statement of the conclusion reached and a hint of the Madhyamika resolution to be worked out in the later chapters. In the chapter ‘The Absence of Being in Things’ (XII) the conclusion is given in this way: ‘Whatever is not what it pretends to be, is unreal.’ All proffered concepts have shown themselves to be pretence, and it is bluntly claimed that all concepts (dharmas) are pretence by nature (p. 144); from this it follows that the everyday world, which is a network of concepts, is unreal. Nirvana alone does not pretend to be what it is not. But how can everything pretend? How can all Cretans be liars? Must there not be something which does the pretending and is not itself pretence? At this point Madhyamika briefly displays its crucial notion, sunyata - the absence of being in things and hints at the way in which in later chapters (especially XIII, XIV, XVIII and XIX) it will be introduced to show the way out of the jungle of entangling concepts and theories so far encountered. In this chapter (XII) sunyata is said to be ‘the exhaustion of all views’ that is the dissipation (intransitive) of all views, but not itself another view: nor even a predicate which might be attributed to things.

In the remaining chapters, in what may, very loosely, be called the second phase of the investigation, the term sunyata gains increasing importance as Madhyamika thought moves explicitly into the great controversial issues: being and non-being, self and the way things are in truth, the nature of an enlightened being, the relationship of the everyday world and the surpassing truth, the distinction, subtle but fundamental, between nihilism and Madhyamika and, finally, nirvana. In these investigations the radical mind of Madhyamika becomes more recognizable, and the ways in which it may possibly throw some light on issues with which Western philosophers are familiar become more testable.

Some general characteristics of Madhyamika thought

At this point in the Prasannapada, even before discussion of these major questions, some pervasive characteristics of Madhyamika thought will have become apparent, possibly estranging. Most obvious, probably, will be the formal, not to say rigid, way of proceeding with the analysis of each of the chosen topics. As most of us assume we can find some good sense in our everyday categories, we prefer to search more informally, more openly, somewhat in Aristotle’s manner, for aspects or uses of them which are worth retaining; but, as Madhyamika was convinced that the categories of our everyday thinking were lacking in ultimate sense, it proceeds more swiftly and more ruthlessly. The forked stick which they used to destroy every proffered view consists, quite simply, and contrary to certain prejudices, of the Aristotelian principles of contradiction and excluded middle. These principles lie so deep in the minds of Nagarjuna and Candrakirti that, though operative at every turn of their serpentine arguments, they are not explicitly enunciated as principles of method, though they are adduced as reasons in argument. ‘As to exist and not to exist are reciprocally contradictory how can they hold of one and the same thing?’ Nagarjuna asks (p. 120, 7cd) and Candrakirti adds that this would be ‘clearly nonsensical’. Even deeper lies the law of excluded middle. Madhyamika cannot proceed into an enquiry without applying it: an object is either in motion or it is not; an object is either external to perception or it is not; an agent is either in action or he is not; fuel is either burning or it is not; and so on.

These two principles are the bedrock of what is often called the Madhyamika dialectic. The procedure is to dichotomize the possible views on any matter into a formal, and final, either/or: the one in motion is either identical with or entirely other than motion itself; the subject of perception must be either identical with perceiving or wholly other than it; an agent subject must either be identical with his activities or wholly other than them; and so on. Either of the two, mutually exclusive, ways of taking any matter must, Madhyamika insists, be intelligible in itself without reference to its opposite. This contrasts with the everyday way in which sense is sustained by ignoring such a dichotomy, by unknowingly fusing the two possibilities into one workable, if imprecise, concept. Having set up a rigid either/or, Madhyamika then exhibits the untenability of both, either by showing each to be self-contradictory, or contrary to experience or incompatible with the possibility of enlightenment. In the last analysis the endeavor is to convince that the ideas in question are, in rigor, unthinkable. Nagarjuna’s rampage through the notions of the philosophers is directed at uncovering their ultimate nonsense with a view to releasing men from humiliating bondage to them.

This aspect of the method of Nagarjuna and Candrakirti has been obscured in some modern treatments of the Prasannapada by a fascination with a feature of their thought which they speak of explicitly, which is traditionally Buddhist and which holds out some promise of logical novelty. This feature, as old as Buddha himself and no doubt much older, is the insistence that assertions about any matter have four possible forms catuskoti (1) that it is; (2) that it is not; (3) that it both-is-and-is-not; (4) that it neither-is-nor-is-not. One may be tempted to see in this recurring thought pattern an alternative logic, a novel evasion of the principles of excluded middle and non-contradiction. It may indeed have some logical ‘interest; certainly it is interesting to relate the four types of assertion to one another for their value and force in argument. Whatever one concludes, however, it will have little, virtually no, bearing on Madhyamika method, for, with one egregious exception the catuskoti is not used as a means of investigation or of argument throughout the Prasannapada. The exception is the enquiry into nirvana (Chapter XIX) where the untenable views are rejected in order as they hold that: (1) nirvana is something real; (2) it is something unreal; (3) is something both-real-and-unreal; (4) is something neither real- nor-unreal. Nagarjuna was surely wise not to have applied this formula more often; it proves in
its nirvana application unhelpful and misleading. The first two alternatives make sense; but the third surreptitiously repeats the first; and the fourth (which is in fact a formulation normally reserved by Madhyamika for its own position) is refuted on the, logically, arbitrary ground that no one could possibly know that nirvana was neither-real-nor-unreal, a point equally valid against the other three alternatives as well.

Though the logical importance of the four alternative assertions may be, and has been, exaggerated, its importance for Madhyamika philosophy of language, and hence ontology, and hence understanding of human freedom, is great. The catuskoti exhausts the ways in which the verb ‘ontology, and hence understanding of human freedom, is possible to be used. One may affirm the ‘is’ of something, or affirm the ‘is not’, or ‘both-is-and-is-not’, or ‘neither-is-nor-is-not’. In all four ways language is being used ontologically; the verb ‘is’, in whatever variation, implies the being or nonbeing of what the assertion is about. Nagarjuna and Candrakirti repudiate all of the four alternatives: they repudiate the ontological implications of the verb ‘to be’. They virtually never use the four alternatives as a logical tool, but they introduce them (at times just the first three) in order to make their repudiation of any conceivable implication of the ideas of being or nonbeing unquestionable and unconditional. How it may be acceptable for them to invalidate the arguments of their opponents by a rigid, non-contradictory logic, and repudiate all ontological assertions, and still speak meaningfully about human bondage and freedom is, obviously, a matter which requires further discussion.

One taking up the Prasannapada for the first time must be struck by the seeming perversity of its refusal to enunciate precise theories in opposition to the theories which it so mercilessly denounces. Nagarjuna says: ‘I advance no thesis and so cannot be faulted’ (p. 37). Whatever one thinks about the justification offered for this statement, it is not irresponsible sophistry. Candrakirti’s explanation runs: ‘But the Madhyamika brings no reason or ground (hetu) against his adversary; he makes no use of reasons and examples but pursues his own thesis only until the opponent gives up his’ (p. 38). Madhyamika, according to Candrakirti, could not, in good sense, advance arguments claiming to have a ground, for this would imply the ontological basis of logic and language. It is enough, in the interest of freeing the mind from its obstructive lumber, to convince the opponent that his theory entails, by logical consequence (prasanga), conclusions which are unacceptable to reason, or to common sense, or to Buddhist axioms. Because of this conception of the function of argument, Candrakirti is accounted a spokesman for the Prasangika branch of the Madhyamika school. His rival commentator on Nagarjuna’s Middle Way Treatise, Bhavaviveka, because he held that a Madhyamika could and should advance selfcontained, autonomous

(svatantra) arguments, is regarded as a spokesman for the svatantrika branch of Madhyamika.

Candrakirti’s seemingly untenable claim that the negation of an opponent’s point of view does not commit one to the point of view from which the negation was made (pp. 36, 38) must provoke puzzlement and certainly requires some study. It may be understood within the logic of negation with at least partial approval though the Madhyamika understanding of its own procedure is not primarily logical. It presupposes that language is not ontologically bound, that assertions function within a jungle of infinitely articulable conceptions, and serve to promote or hinder the vital energies latent in these. The attack on concepts, on points of view, is aimed at the vivial energies to which they are wedded, though it must strike the ideas en route. The success of the attack is measured by the lessening of the clutter of ideas which blocks the way to clarity of mind and to a grasp of the way things really are. The prasangika understanding of the purpose of thought does not prevent Candrakirti from giving a Madhyamika resolution of the major questions facing Buddhist philosophy. In each case, however, he does decline to offer one more theory in addition to and in competition with, and of the same order as, the theories advanced by other schools. The Madhyamika attitude, when it is given positive expression, never takes the form of a metaphysical theory (which would be a self-contradiction) but is offered as an interpretation of Buddha’s words in the interests of bringing the way of enlightenment closer to listeners and readers. Dependent origination is not a metaphysical theory, nor is the absence of being in particular things, nor is nirvana as the coming to repose of the manifold of named things. These resolutions of the crucial Buddhist concerns are not metaphysical theories, but elaborate expressions of the total posture of one on the Buddha’s way. We are today scarcely accustomed to this understanding of philosophy, but this is hardly an argument against it; in any case this is the attitude pervasively implicit and, at times, quite explicit (p. 238, 18) in the Prasannapada, I believe.

Before taking up the crucial Madhyamika concerns of the later chapters one further presupposition of their thought, so important as to be nowhere explicitly justified, must be singled out. According to Nagarjuna and Candrakirti, as I have just stated, reasoning is not ontologically bound; yet they proceed, unshakably assuming that what fails the tests of reason -- what is less than utterly intelligible - cannot exist. They fault and reject as untenable, in a ruthless and perhaps intolerant manner, every proffered concept or viewpoint which can be shown to contain even the slightest ambiguity, unclarity or unintelligibility. The two expressions most frequently used throughout the Prasannapada are ‘this makes no sense’ (na yujyate) and ‘this is logically impossible’, or, ‘this is unintelligible’ (nopapadyate); the former being, obviously, more general and less ontological, the latter being the final condemnation of a theory found to
be, in rigor, unthinkable. For thinkers often held to be ‘mystical’, the Madhyamika understanding of thinkability is surprisingly narrow and unyielding. Whatever attempts to own incompatible predicates are repudiated as unintelligible; unlike Hegel, Madhyamika will not tolerate the synthesis of opposites. ‘So, to “possess a characteristic” and “not to possess it” are contradictory. But what is contradictory cannot exist’ (p. 105). The expression ‘cannot exist’ (na sambhavati) means either or both ‘is not logically possible’ or ‘cannot come to be’; we might say it embraces both the possibilities of thought and of existence, though this distinction is not consistently maintained by Buddhists. The Madhyamika is the most dogmatic rationalist of any tradition. It may seem that if Madhyamika rejects the claim of what cannot be clearly thought to be a description of the way things really are, it should hold that what can be clearly thought would be such a description. But Madhyamika will not be committed to the opposite of what it repudiates; it will not, and cannot, agree that the utterly intelligible is the truth; and for a simple reason: there is nothing utterly intelligible. The mind (buddhi), is not, like Aristotle’s nous, endowed with the ability to know being; far removed from that, its natural activity - conceptualization - is rather an obstruction, albeit a natural obstruction, which is to be calmed and clarified before the truth can be present (p. 172). The truth is not presented to the intellect alone, and, hence is not intelligible; it cannot be present until the intellect has clarified itself by surpassing the demands of intelligibility (p. 177,7). If this can make sense, whether or not it is acceptable, then it becomes understandable how the Madhyamika can be a rigorous rationalist in his negative destruction of all theories about existence, and yet not be bound to the complementary view that existence is rational.

The crucial concerns of Madhyamika

The crucial concerns of Madhyamika thought, the matters it cares about, for which it undertakes the serpentine tasks of philosophy, may now be mentioned against this background of presuppositions and general characteristics. Nagarjuna, supported by Candrakirti, first examined in the early chapters all known attempts to give an account of the world as it presents itself from day to day, and found that none of them made sense; that, consequently, the world, or ‘life’, as we ordinarily experience it, is without any meaning; and so, one might think, has worked himself into a nihilist or at least scepticist, cut de sac. But Nagarjuna and Candrakirti do not concede this. They are sure that the destruction of metaphysics is not the end of meaningful life but that it opens new possibilities of finding sense in human existence. It was r:agarjuna’s historical achievement to give the earliest coherent expression to Mahayana Buddhism, the new way of regarding human affairs in which the immediate awareness of the uncreated truth of all things allowed all things to serve as the occasion of human enlightenment. This non-mediated presence of the truth, a world removed from the personal intuition (prajna) of early Buddhism, was known in the religious literature (sutras) of Nagarjuna’s time as prajna paramita - the surpassing or consummate prajna. Though this expression is not used in the Prasannapada, it, like the religious thought-world of Mahayana Buddhism in general, is held quietly in the background as a kind of invisible sounding board for the arguments being noisily worked over in the foreground. The scepticism of the Prasannapada does, I believe, stand firmly on its own feet as an adventure in rigorous thought; and yet its function is to make it possible to comprehend the bodhisattva the enlightened man of Mahayana Buddhism. The bodhisattva is a enlightened being, and yet embodied - transcendent and immanent because, as the absence of being in things is their truth, the everyday world is the locus of nirvana.

The thought of the Prasannapada, understood in this way, presents us With the problem of grasping how it moves from a failed attempt to find a tenable account of experience in the conventional terms of causality, subject and attribute, motion, time, space, external objects, perception, passion, agent subject, and so on, as well as in the strictly Buddhist terms of suffering, bondage, freedom, and so on - a failure which could justify scepticism and even nihilism - to a hymnal affirmation of the surpassing worth of the human adventure. By what means does Madhyamika restore meaning to a scene of analytical devastation?

To treat this problem adequately, assuming that one would dare to try, would be a major experiment in thought. At this juncture, with a view to easing the reading of what, for many, must be a strange book, nothing more will be attempted than a pointing up of the crucial turns in the Madhyamika struggle to give an account of human experience commensurate both with its sceptics and the new Mahayana vision. I will suggest some preferred ways of understanding Madhyamika, but will try to avoid closing off what must remain an open and continuing study. As crucial turns I count the following:

1 The enquiry into being, or ‘self-existence’.
2 Sunyata, the truth of things.
3 The ‘two truths’.
4 The encounter with the boundaries of language.
5 Nirvana.
6 The middle way as resolution of the philosopher’s conundrums.

Self-existence

Nagarjuna’s attack on the idea of self-existence, to which he devotes a separate enquiry (Chapter XIII) may be seen as the hinge of his reformation of Buddhist thinking. Earlier Buddhist metaphysicians had resolved the problem of permanence in seemingly universal flux by the notion of dharma. There were thought to be limited numbers of ultimate, irredicible, simple constituents of existence which combined in time, to produce the perishable mental states
and things of the everyday world, without themselves perishing. Dharmas were not substances, nor qualities, nor relations, but self-characterizing, simple reals. Nagarjuna, taking the idea of self-existence in full earnest, insists, in Parmenidean fashion, that what is self-existent must be uncreated, imperishable and not dependent on anything else: what is in and through itself. Parmenides’ solution, however, could never have occurred to a Buddhist for whom the ceaseless arising and perishing of things is the primary given and who must have a world in which meaningful transformation of human existence is possible. Plato’s imperishable substances, innocent of temporal and spatial qualification (dharmas as eidoi) were inconceivable to Nagarjuna as they beg the question of permanence in time; and he would have quickly reduced Aristotle’s ousia theory to mere nominalism. Nagarjuna was committed to rejecting any solution which remained within the bounds of mere theory.

Using the common example of the heat of fire, he argues that nothing in all of experience can meet the demands of the idea of self-existence: everything arises in time from causes. At this point Candrakirti’s answer to the question of an opponent constitutes one of the seminal passages in the Prasannapada. Solely the unchanging nature of all things throughout all time is self-existent, he expounds (p. 156); this is nothing particular, nothing definable; it is what is common to all dharmas, namely, their lack (in the conventional sense) of both self-existence and non-self-existence; it is sunyata; and a synonym for sunyata is tathata - the thus-it-isness, or thusness of things, a common way of speaking of the truth about things. So: the absence of being in things is their being, their self-existence, their truth. In this way Candrakirti turns the problem around. He shows that the term self-existent is unthinkable within everyday experience and yet, far from discarding it, which he might have done, he elevates it to the realm of ultimate truth and nirvana. Clearly its original sense must suffer some transformation in this process and not merely by becoming a metaphor. It is more likely that an originally distorted, unintelligible expectation of finding selfexistence in substantial form among ontic existents led, in spite of its falsity, to a search for something uncaused because outside the dimension of causality: to something approachable only as ‘self-existent’, yet beyond the dimensions of both conventional existence and conventional selfhood.

Despite the somewhat honorific use of the term self-existence to speak of what for Buddhists is ultimate, that is, enlightenment, it has become clear that nothing within the processes of the everyday can claim to be self-existent. The full weight of this turn of thought becomes evident when it is followed by the statement that if there is no self-existence in things neither can there be non-existence, as the two ideas are only reciprocally meaningful. Buddha’s authority is drawn in to clinic the conclusion that both the notion of existence, or isness, and the notion of non-existence or is-notness are false dogmas and make it impossible to comprehend the truth of things in his sense. This sets the problem for the remaining excursions of Madhyamika thought: how to carry on with meaningful talk about the central concerns of a philosophy which believes it can show that the idea of existence, of isness, of being, is empty?

Language, without the force of the verb ‘to be’, would seem to be mere fantasy. The simple sentence ‘Enlightenment is neither existent nor non-existent’ is unintelligible. How can Madhyamika seriously hold such a position?

**Sunyata**

When we take up the term for which Madhyamika is best known, Sunyata, the troubles become more interesting though not fewer. The term sunyata, which I translate throughout ‘absence of being in things’ snakes its way through all Madhyamika thinking, arousing puzzlement, wonder, insight, and despair in those who try to follow its tortuous path. It has often been called the void, sometimes emptiness and at times, after its mathematical meaning, zero. It has been more recently understood as openness, and, in some usages at least, merits the translation ‘the truth of things’. It is so utterly novel that we must exercise some patience in attempting to grasp its full significance for Nagarjuna and Candrakirti.

Tactically, Madhyamika found itself attacking the realism of Buddhists who found being in the simple constituents of everyday things (dharmas) or of non-Buddhists, who found being in the everyday things themselves. In this sense, in denying that anything ontic has selfexistence, or, has its being in and through itself, sunyata means simply nihsvabhava, that is, absence of self-existence. This is by far the most frequent use of the term and, understandably, might be taken to be its definitive sense. Candrakirti is, however, very careful to explain at every critical turn (and this could be missed if one read only Nagarjuna’s verses) that though everyday things and their constituents are lacking in being, they would be falsely, indeed heretically, understood as non-existent in every sense; neither existence nor non-existence should be predicated of them. The full value of the term sunyata then should be given as ‘the absence of both being and non-being in things’. That this simply must be so becomes clear when sunyata is related to the ‘two truths’, to the middle way, to Madhyamika theory of language and to its understanding of enlightenment.

The hinge of Nagarjuna’s revolution is his re-thinking of the original root concept of Buddhism - dependent origination - as sunyata. Early Buddhism, after rejecting the theories of causation current at the time, gave an account of the everyday in terms of the dependence of one thing or -event on a preceding: the sprout is not caused by the seed, but does depend on the previous existence of the seed for its own arising. This understanding makes sense only so long as
its terms, ‘seed’ and ‘sprout’ are taken as real, as something between which the relation of dependence could be supposed. Nagarjuna retains the expression dependent origination, but, having denied both seed and sprout selfexistence, he must hold that the dependence of the one on the other can no longer be understood in the traditional realistic sense. It becomes rather the non-dependence of non-existent; there is no longer a real origination of anything in dependence on anything else. Candrakirti comments bluntly, “We interpret dependent origination as sunyata” (p. 235). If, in the world which each of us holds together for himself, the causal account is delusory, if, that is, all the things inner and outer which make up a world neither arise nor exist in the realistic, initiatory way we naively suppose, then the events and sequences which compose life are analogous to a magician’s deception: what truly goes on is made to appear like a series of causally dependent events, but is not. The frequently recurring use of the analogy of magic (maya) can be misleading. It does not mean that Nagarjuna and Candrakirti are hallucinationists, that a magic wand will serve to conjure up and to spirit away the everyday world. Their insistence, repeated impressively often, that they are not nihilists, that the dogma of non-existence is as much a heresy as the dogma that everyday things as such are in being, should warn us to look for another understanding of the analogy of the magician’s trick. This is a subtle and difficult point. It may suffice at this juncture to remind that the indispensable factor in a magician’s trick is the false interpretation placed on the evidence of the senses by the spectator. Coins, cigarettes and rabbits are manipulated by the magician strictly in accord with the laws of motion and gravity that govern all objects. It is the spectator who, due to the shallowness of his imagination, penetrates no deeper than his eyesight and sees these objects passing bewilderingly in and out of nostrils, pockets and top hats. The events making up the trick, the palming of the coin or cigarettes, the collapse of a false bottom in the hat, are not dream, not hallucination, but run of the mill space-time sequences onto which the spectator projects his false expectations.

Sunyata is not only the repudiation of a causal account of the everyday, it marks the repudiation of any account: it is not a theory about the space-time world. In the enquiry into sunyata and the ‘two truths’ (Chapter XVIII) the opponent’s attempt to fix a metaphysics of nihilism on the notion sunyata is rejected by distinguishing between the delusive everyday (samvriti), where metaphysical theories appear to have their proper locus, and a higher truth (paramartha). The thought here is somewhat inexplicit but the way in which the distinction of the two truths is introduced at this point implies that sunyata is not one more theory among the many traditional theories offering an account of the factual world; it implies that such theories are delusive shadow boxing: accounts of what is not there, as if one set out to explain the delusive appearances of the magician’s tricks strictly in terms of the delusive appearances themselves.

Metaphysicians are, as it were, attempting to give a reasoned account of the emergence of rabbits from empty hats or of coins from nostrils. Madhyamika is determined to expose the supposed world of fact as a magician’s trick and in this way to render all metaphysics ridiculous. They attempt to show that theoretical explanation is founded on the delusive fiction of entities in being affecting each other causally. Nagarjuna says this sweepingly, ‘Sunyata is the exhaustion of all views’ (p. 150, 8) and adds ‘Those for whom sunyata is itself a theory are incurable.’

The special status of sunyata - as not one more delusive view but something not of the nature of a view - is marked out in the chapter ‘The Absence of Being in Things’. It is declared that all compound things are not what they pretend to be; that what is not what it pretends to be is unreal; that therefore all compound things are unreal (p. 144, 1). This can be taken as a restatement of the magician analogy; but in any case it provokes the natural rejoinder ‘If all compound things are unreal, what is it in that case that pretends?’ (p. 145, 2). That the answer is sunyata tells us much about the use of the term. There is no eternal being, no Absolute as Brahman, nor a real individual entity concealed behind the pretence; there is no pretender; there is simply, if unaccountably, a false imitation of being to particular things. Why sunyata is introduced at this point is not easy to comprehend, it is certainly not made explicit, but it may be because it is the preferred understanding of self-existence and hence the source of the pretence everyday things make of being self-existent entities. In any case sunyata extricates Madhyamika from a situation very close to the liar’s paradox and that can mark for our purposes the transition from sunyata as the preferred account of the everyday world to sunyata as the way into the Madhyamika understanding of the world of the unborn. I will attempt to trace this often confusing way by considering what Nagarjuna and Candrakirti have to say about the ‘two truths’, the boundaries of language, nirvana and the middle way.

The two truths

Though the notion of ‘two truths’ (satyadvaya) is implicit in Buddhism from the beginning, as it is in Vedanta and, indeed, in any philosophy or religion that holds to a norm distinct from the everyday, Madhyamika alone makes the distinction into its crucial thought. The two truths elevate the distinction between the born - the temporal - and the unborn - the timeless - of the Buddha’s own discourses to the reflective level. The problems which this distinction introduces into reflective thought become explicit and acute for Nagarjuna under the terminology of samvriti - the temporal, the everyday - and paramartha - the timeless, the truth of enlightenment. Though these terms are used sparingly in the Prasannapada, the distinction and its problems are implicit, just barely beneath the surface of discussion, throughout the entire course of the investigation. Candrakirti takes up the problem explicitly in Chapter II. He
argues (pp. 59-60) that neither is the idea of a characteristic apart from what it is a characteristic of intelligible, nor is the ide of what is characterized apart from its characteristics. This reciprocal dependence deprives each term of its claim to exist or to be intelligible in its own right, and that fact, Candrakirti states, is the mark of samvrti; it is unintelligibility which distinguishes it from paramartha - the higher truth; it is the failure of the concepts ‘characteristic’ and ‘thing’ to make sense which tells us they cannot be true ultimately. Candrakirti does not say that the truth of things is intelligible. It is the very main hinge of Madhyamika that he does not feel committed to that conclusion. He is searching for an understanding of things without an explicit concept of what would count as the truth and yet confident he has a negative criterion adequate for the detection and rejection of what fails to be what he is searching for. How Madhyamika resolves this conundrum, if it does, is perhaps the most interesting question it can raise for us.

Chapter XVIII, in spite of its title, is about the two truths and their relation to the absence of being in things. Nagarjuna, replying to a critic who has accused him of being a nihilist, of holding the view that the putative entities of the everyday world do not exist in any sense, counterpoints (p. 230, 8) that such a misguided critic is one who does not understand the two truths. It seems clear that he means to contrast the proper understanding of sunyata, namely that everyday things neither exist nor do not exist, with the naive view that things are self-existent entities. Candrakirti explains (p. 238) that sunyata, properly understood is, itself, the higher truth of everyday things, and nothing else. The distinctions used in karika 10 between the transactional world (samvrti) , the higher truth (paramartha) and nirvana support the view that Madhyamika worked with three truths, not two, distinguishing between the higher (more true) truth about everyday things (paramartha), i.e. that things are sunya, and the realization of that truth in enlightenment (nirvana). But Nagarjuna and Candrakirti are not consistent on this point; more often sunyata, as the truth of things, is not separated from the incorrigible, trans-factual awareness of the way things really are, which is itself enlightenment. In this sense any theory of sunyata, however adequate, belongs, by definition, to the ordinary world, because it must perform, in forming sentences with words, use the concepts of entity, characteristic, the verb to be and all the vocabulary of delusive samvrti which Madhyamika rejects as a vocabulary for philosophy. In so far as the higher truth is a theory, it falls, being verbal truth, within the lower truth. This ambiguity may be resolved on further study, but for the moment I am content to let it stand. The higher truth is satya, both a truth and a reality, both the explanation and the realization of enlightenment.

The limits of language

Such a seemingly clumsy aporia was not, of course, left unattended by Nagarjuna and Candrakirti. It is taken up further in terms of the limits of language. Chapter XIV, karika 7 makes it clear that language can refer only to perishable objects of thought (there are no other), not to the truth of things; and karika 9 says that the way things really are cannot be manifested as named things. In his commentary Candrakirti explains that ordinary language ceases to be effective and valid (that is, no longer functions by reference to objects) in the realm of the higher truth. Nagarjuna’s scandalous aphorism (p. 262, 24) ‘No truth has been taught by a Buddha for anyone, anywhere’ appears to strengthen this view. This seems to be a dead end: only wordlessness is appropriate to the higher truth. It is not, however, because Candrakirti adds at once that there is a need to point out or to teach the higher truth and to do this one must fall back on ordinary language, as one who wants a drink of water makes use of a receptacle to fetch it, but drinks the water. It is clear that there is no special vocabulary or grammar reserved for discussion of the higher truth; in discussion it becomes an integral part of the everyday truth. But then how point to it or teach it at all? How understand the capacity of a wise man to use words when helping others toward enlightenment?

This is the crux, and the Madhyamika answer turns on its denial of the cognitive function of language, whether in its ordinary use or in a putatively higher philosophical and religious use. There are, bluntly, no entities to which words refer. There is no entity ‘person’ distinct from an individual psycho-physical history, though we mistakenly think we refer to such; there is no entity corresponding to the word ‘chariot’ distinct from axles, wheels and so on. In all such cases the noun word functions not by naming, not by furthering cognition, but as a prajnapti. Prajnapti becomes, in Madhyamika discussion, a technical term carrying a heavy burden of importance. This is widely recognized though it has not as yet been adequately studied. I understand a prajnapti to be a non-cognitive, guiding term which serves to suggest appropriate ways of coping with the putative realities on which it rests for its meaning and to which it lends meaning. ‘Person’ rests on the putative reality of psycho-physical traits, and ‘chariot’ presupposes wheels, axle, and so on. There is, in truth, no entity ‘person’ and none ‘chariot’ named by these words and hence there is no entity to be cognized. This is a kind of nominalism and yet is much more.

Language is of one piece and does not function differently when used of the higher truth. Karika 18 (p. 238) is Nagarjuna’s great dictum in this matter. He says that dependent origination is sunyata and ‘Sunyata is a guiding, not a cognitive, notion presupposing the everyday.’ In this one sentence all of Madhyamika metaphysics is converted to praxis; its two central terms, dependent origination and the absence of both being and non-being in things, are declared to be non-cognitive (prajnapti) as ‘person’ and ‘chariot’ are. They cannot be offered as descriptive words; to say of a
person or a chariot that it neither is nor is not, cannot describe them because the refusal to use the verb ‘to be’ ontologically precludes the attribution of any descriptive predicates. What function remains to words then, but to suggest or prescribe appropriate ways of behaving toward ‘things’? This is, of course, a crucial and a most difficult question, but, for my own part, the Prasannapada makes sense in a total way only on some such interpretation of its key terms. A prajnapti is a guiding notion, a notion which a long tradition of successful teaching finds effective in helping students toward the clarity of mind that marks the wise man. Neither Nagarjuna nor Candrakirti anywhere says this explicitly, but, after the denial of the ‘is’ of predication, no other interpretation remains credible. When Nagarjuna says that sunyata is a prajnapti presupposing a base (upadaya) as person presupposes psycho-physical traits and ‘chariot’ axle and wheels, he is saying, I believe, that his own philosophical vocabulary functions only presupposing ordinary, entitative language as its base of meaning; ordinary language is the receptacle that carries the water of wisdom. On this interpretation, the entire, August range of Buddhist notions, enlightenment (nirvana), reality (tattvam), the truth of things (tathata), the quintessence of all things (dharmata), and Buddha himself become prajnaptis, serving to lead men toward freedom, but not claiming to describe any reality or convey any ultimate truth. Candrakirti repeatedly avers that no Buddha used words except for the purpose of guiding beings to enlightenment (e.g., pp. 175-7).

That this seemingly heretical view is not a passing aberration is borne out in the chapter devoted to the inquiry into nirvana, where, after Nagarjuna’s search through the traditional ways of understanding nirvana, Candrakirti concludes ‘Therefore it has been established that even nirvana does not exist’ (p. 263). Any attempt to conceive nirvana ontologically is undercut by the insistence that it is the utter dissipation of ontologizing thought (kalpana) which is nirvana (p. 249). To entertain concepts like personal afflictions (klesa) or factors of personal existence (skandha) (which, Buddhists conventionally hold, must be removed in order to attain nirvana) believing either that they are or are not is the very habit which ensures continued bondage. This is not merely an attack on academic theories; it is understood in the radical sense of withdrawing the affirmation of being from all things, inner and outer, without exception. This is formulated in the phrase ‘the coming to rest of the manifold of named things’ (p. 249) which is, throughout the investigation, among the many paraphrases and explanations of nirvana, the most persistent.

Nirvana

Madhyamika may have, at this point, frustrated any attempt at conceiving Nirvana in terms of a reality, but one may still wonder if their position is anything more than Schopenhauerian negativity. One need not wonder for long. When the conventional conceptions of nirvana have been repudiated, Nagarjuna moves forward to a fresh understanding of Buddhism which radically influenced later developments and which retains a certain perennial appeal. Nirvana, in Nagarjuna’s understanding, is not the end of life, nor the denial of life; it is a discovery of ‘the way things are truly’; it is a return to the world following a radical purification of the ‘being’ who is to appreciate it; Nirvana lets the world become what it is.

This revolutionary understanding is developed in Chapter XIX, the culminating, if philosophically not the most intricate, investigation of the entire treatise. Karika 9 (p. 255) may be taken as the aphoristic quintessence of Madhyamika thought: ‘That which, taken as causal or dependent, is the process of being born and passing on, is, taken noncausally and beyond all dependence, declared to be nirvana.’ Nirvana is a radically altered way of taking the process of being born and passing on, that is, the everyday. The everyday is the only ‘locus’ there is for Nirvana to realize itself in. This karika sets a conundrum for thought that cannot be brushed aside; and it makes the predominant Western interpretations of Nirvana, from Schopenhauer through Nietzsche and Max Muller to Albert Schweitzer seem inadequate, even distorted. Once and for all nirvana is declared not to be realized in a locus other than the turmoil of birth and death; once and for all it is declared not to be extinction of life, nor an afterlife, nor a distant realm of being. Karikas 19 and 20 (pp. 259-60) make this point even more provocatively; the one saying there is no specifiable difference whatever between nirvana and the everyday world (samsara) , the other that nirvana has no other ontic range than that of the everyday world. What ~ mind-splitting thunderclap this conception must have been to Nagarjuna’s contemporaries! At issue is the nature of Buddha, of the truth of Buddhism itself: how to grasp the embodiment of a sense of life that endures in all circumstances. Nagarjuna’s great insight is that nirvana as an afterlife is unintelligible, because a limit to the illimitable. Nirvana is wherever the Buddha-nature prevails: so, as ontic realms ~ and an afterlife is just as much an ontic realm as this life ~ there is no difference between Nirvana and samsara. To say in English, as the translation does, that the ‘ontic range’ of nirvana is the ontic range of samsara is, on the face of it, a gross distortion: Nirvana can have no ontic limitations whatsoever as is self-evident. The difficulty is common to all efforts to bring the everyday into touch, by means of everyday language, with what surpasses it. Candrakirti is quite clear about Nagarjuna’s meaning. He tells us that both the everyday and nirvana are of the same basic nature, are of one essence (p. 260); dependent origination, which is to say non-dependent non-origination, the absence of being in things, the essentially peaceful nature of things, is the truth both of the everyday and of nirvana. There is no other existence, no other world, of which nirvana is the truth.
In the culminating pulse of the nirvana chapter Candrakirti’s thought moves to its loftiest height and binds together the main threads of the entire treatise. He comments on Nagarjuna’s verse ‘Beatitude is the coming to rest of all ways of taking things, the repose of named things’ (p. 262, 24) by juxtaposing the crucial ideas of Madhyamika. Beatitude - nirvana - is understood in terms of two criteria: (1) the coming to rest of all ways of taking things (or of all ways of perceiving things); (2) the coming to rest of all named things (or of language as a naming activity). These two criteria are in Candrakirti’s application virtually one, though the second is the preferred formulation. He expounds by reviewing six essential aspects of the everyday world, the ceasing to function of each of which is an aspect of beatitude or nirvana. These six aspects are: (1) assertive verbal statements; (2) discursive thought; (3) the basic afflictions; (4) innate modes of thought (vasana); (5) objects of knowledge; (6) knowing. Nirvana is not produced by the cessation of these factors; their cessation is nirvana; there can be no causal, or other, relationship between samsara and nirvana; nirvana is not another something to which anything ontic can be related. The cessation of each of these six factors, is said to be the coming to rest, or the repose, of named things. Each cessation is somehow complete in itself, one way of elucidating what the repose of a world supposed to consist of entities with names, might be like. Such a world is not wiped out, or reduced to meaninglessness; the turmoil is drawn out of it so that it becomes transparent to the ever-present Buddha Truth. That is all. As assertions of knowledge have no place in nirvana (being inseparable from some interest, however subtle) we need not ask for information about it, nor can we treat it as having being. Candrakirti’s final coup is ‘Therefore it has been established that even nirvana does not exist’, and he quotes the verse ‘Nirvana is no-nirvana the lord of existence taught; a knot tied by infinitude and loosed even by the same’ (p. 263).

Western interpretations of Madhyamika

This understanding of nirvana was difficult for the classical Indian critics of Madhyamika to comprehend, and has been not less so for modern Western interpreters. Among the many conflicting interpretations, the French and Belgians, from Burnouf to Poussin, have tended to see a profound and unresolved scepticism, perhaps nihilism, in the final position of Madhyamika. This has always been the frustration of those, whether Buddhist, Christian or atheist, who are wedded to realist attitudes, in the face of frustration of those, whether Buddhist, Christian or atheist, final position of Madhyamika. This has always been the profound and unresolved scepticism, perhaps nihilism, in the Belgians, from Burnouf to Poussin, have tended to see a ‘thinking of the main hinge of Madhyamika is located: namely, at the passage from critical thinking which, like a powerful acid, eats away our stock of everyday beliefs, to an affirmation of the faith which all along was struggling to express itself in the critical thinking.

The greatest Western Madhyamika interpreters of the early twentieth century were Russian and Polish under the strong philosophical influence of Hegel and Kant. Of the many scholars who devoted themselves to Buddhism the writings of Stanislaw Schayer and T. Stcherbatsky are most easily accessible to us. Schayer translates svabhava, which I render ‘self-existence’ as das absolute Sein, although ‘absolute being’ is not an idea likely to be at home in Buddhist thinking. He speaks of the ‘ultimate totality of existence - the one reality’; thinks Madhyamika is a ‘radical monism’; and holds that the ‘presence of the Absolute’ is intuited in a mystical act. As a countervailing emphasis to the early nihilist interpretation this had great value, though Schayer continues to use the language of ontology past the point where Madhyamika enjoins us to put it aside. Stcherbatsky was more Kantian than Hegelian and read the Prasannapada, which he entitles ‘A Treatise on Relativity’ in terms of phenomena and the thing in itself which underlay them. He thinks sunyata is the relativity of things but that the universe viewed as a whole is the Absolute; Madhyamika is an assertion of the absolute whole, it is a radical monism. Stcherbatsky’s translation of two chapters of the Prasannapada was an indispensable step in the modern recovery of this ancient school of thought. If one wishes to criticize his interpretation one can point out that it contributes little to our understanding of the relation of a sunyata philosophy to the Buddhist faith; he does not make clear how ‘universal relativism’ supports the middle way.

T. R. V. Murti’s book The Central Philosophy of Buddhism brought Madhyamika thought squarely into the English-speaking world. Though still somewhat under Hegelian and Kantian influence (and of firm Vedantist conviction) Murti avoids both the nihilist interpretations of Burnouf and Poussin and the ontologizing interpretations of Schayer and Stcherbatsky. He treats the work, focusing more on Nagarjuna’s verses than on Candrakirti’s commentary, as an opus in philosophical dialectics, that is, as a demonstration how each and every philosophical dogma must disintegrate from internal contradiction. Grasping the full implications of this, ‘the reflective awareness of the dialectical play of reason’, is the fruit of philosophy and leads to an utter clarity of the mind which, as an intuition of the Real, is, though without an object juxtaposed to it, still the Madhyamika Absolute. Murti repeatedly repudiates a nihilistic interpretation of Nagarjuna. His work, emphasizing the critical, analytical, sceptical method of Madhyamika, frees it from the metaphysical interpretations of Schayer and Stcherbatsky and opens the way to an interpretation more in keeping with the problems of Indian philosophy. If there is to be a comment on Murti’s book it is that he works from an
epistemological model of enlightenment which still leaves the existential grounding of the Buddhist middle way something of a question mark.

A fresh attempt to convert Nagarjuna into contemporary terms has been made by F. J. Streng, who works with unmistakably religious questions in mind. Streng insists that there is no Absolute in Madhyamika; sunyata, which he takes as ‘emptiness’, stands rather for the openness of the world to personal transformation. Sunyata is not metaphysics, nor an object of cognition, it is an aid to the removal of human afflictions. The higher truth is not an absolute, it is a power aiding release from the need of an absolute. This emphasis on the soteriological purpose of Madhyamika thought is, it seems to me, a move in the right direction; I can understand its purpose in no other way. Streng’s emphasis, however, does, at times, seem to draw the higher truth down into the ceaseless flux of existence in a way that endangers its status as ‘the’ Buddhist truth.

Dependent origination, understood as the ‘flux of existence’, becomes, in Streng’s account, the primary datum. It is here that my own understanding diverges. Dependent origination is itself sunya, neither in being nor not in being, is, indeed, synonymous with sunyata, as both Nagarjuna and Candrakirti are careful to explain, and so could not serve as a primary datum against which beliefs must test themselves: in Madhyamika there is and can be no primary datum available to us through concepts.

The middle way

When one feels the full weight of the Prasannapada as a whole, neither singling out Nagarjuna’s pronouncements nor isolating Candrakirti’s comments from them, the impact, so it seems to me, is squarely and crushingly on the idea of being. More times than anyone has counted, the text insists, sometimes quoting early sutras, sometimes later ones, sometimes arguing from the unacceptability of pairs of opposites, sometimes demonstrating the unintelligibility of self-existence, that there is no way of thinking the notion ‘is’; and if not ‘is’ then not ‘not-is’ either nor any combination of the two. Being is unintelligible and hence a misguided attempt to grasp the sense of the human predicament (pp. 154, 5, 7). Buddha is singled out for praise because he understood this fully. What follows from this is nothing less than the invalidation of all metaphysics or, more sweepingly, of any understanding of life which is based on the notion being. This, nothing less, is the implication of sunyata. If it is delusive to think being, then it is delusive to believe that one can make cognitive assertions about anything.

How are we then to think the things and ideas and people of the everyday world, if not as existing or not existing? Any suggestion involving cognitive claims has already been ruled out; how then to say what the true way of things is? The Madhyamika answer, and this is one way of stating the heart of their thinking, would, I believe, go like this: The way the enlightened man deals with things, is the way they are, is their truth. If one adheres strictly to the Madhyamika repudiation of being and so does not attempt to determine the status of chariots and all other nominal entities, either by asserting that a chariot exists (Plato) or that it is merely a name, i.e. does not exist (Berkeley) or that it exists only as an ineffable union of matter and form (Aristotle), what other means of saying anything about things conceivably remain to us? Madhyamika avoids making cognitive assertions about things by holding that the truth of things is what they mean to the enlightened man; this makes no use of the notion of being; it implies that things become themselves only as they become integral to the way of an enlightened being: the middle way.

The middle way is, in my understanding, the beginning and ending of Madhyamika thought. It overcomes the finality of being and the meaninglessness of non-being, not by discovering a third mode of ‘to be’, somehow suspended between being and non-being, but by moving away from this thought wholly. ‘Middle’ means a way that, although it can be pointed out only by repudiating the pair of opposites, being and non-being, is itself to be understood in a quite other dimension of thought. A way is neither in being nor is it nothing, even though the verb to be is used in talking about it. Language that is not, even implicitly, ontological (and Madhyamika holds that even ordinary language is only delusively ontological), must be understood in some other way, as exclamatory, or exhortative, or persuasive, or prescriptive, or pragmatic, or some combination of these. In the Prasannapada ordinary language is assumed to be all these things, and enlightened language, whose function is to guide beings to enlightenment, is no less so; in neither use is it cognitive or ontological.

What kind of world do we find ourselves in, if words do not name things in being? Certainly it would be as far from Aristotle’s world as is conceivable. One could not know anything in the traditional sense of possessing true beliefs about things in being; nothing could, in honesty, be held to exist as conceived. Such a world, if I grasp Madhyamika at all would consist of seeming things which in truth are not there, though they are most certainly not mere fantasies either. At this point we are very close to the useful limits of language, and indeed Candrakirti often introduces the analogy of the magician’s trick when he must say what takes the place of a world based on things in being. No account can be given of such a world because accounts presuppose things in being. No human can do more than commend a way of dealing with seeming things and that is just what the middle way is and what Madhyamika does. On the middle way, seeming things, while not accepted, are not scorned; delusion is not replaced by a delusion-proof reality. The middle way is possible only in the face of the unending insistence of seeming things to be taken as real things and IS
the sovereign, unruffled capacity to see them, respectfully, as doing just that. Underlying and supporting this middle way of coping with the human predicament is of course the historical fact that Nagarjuna and Candrakirti, as Buddhists, were in no doubt that Buddha had lived in the middle way. Buddha’s life was all the evidence needed that the middle way of coming to grips with the magician’s trick unloosed a universal compassion for all beings suffering in delusion; that, in the middle way, there was freedom from false belief and the promise of human dignity.

So deep and so unaware was this conviction that it takes the place of much explicit argument. Nowhere do Nagarjuna and Candrakirti analyze the middle way as I have attempted to do in these few paragraphs? It was not, for them, a problem: after all they could live it. For us, who are attempting to understand, in twentieth-century terms, what they lived, it must remain a problem of interpretation. That the middle way supersedes philosophical theory and moral exhortation, fusing in itself feeling and will and intellect, is offered her: as a contribution to that understanding. This interpretation of Madhyamika must, I presume, lean a little to one side or the other yet it does so as little as I can make it. The text which follows is the touchstone.
Essay: Emptiness — The Philosophy of Nagarjuna

Was Nagarjuna a Philosopher?

According to Anthony Flew and many other philosophers, no philosophy was done east of Athens in pre-modern times. It is important to see that this is not true, and Nagarjuna is a good example to show this. It is true that central to his work is a religious purpose: to provide a foundation for how the Buddhist quest for nirvana could work, and to help others on that quest by showing that there is nothing in the phenomenal world to become attached to. (See Streng 1967.) All of Nagarjuna’s works are broadly soteriological in nature: he is trying to break the habit of reification that is at the root of grasping and craving and hence all suffering (Garfield 1995: 314). In some passages he brings out the religious implications for the Buddhist way of life (e.g., MK 23.23-25, 24.24-35; VV 54-56, 70). Nagarjuna did not have to argue for the basics of a Buddhist way of life, since his audience was Buddhists — a Buddhist framework was simply assumed by all involved. But philosophy can be in service to a religious end, as with philosophy being the “handmaiden” of theology in the Western Middle Ages. Here, Nagarjuna is trying to show that one way suggested to ground the Buddhist way of life — that of the Abhidharmists’ self-existence metaphysics — cannot work. And he is engaged in a type of conceptual analysis of categories by an appeal to reason and everyday experiences shared by all — something that today’s philosophers can readily recognize as philosophy, even if they do not agree with his particular analysis.

In sum, one can be a philosopher and still have a religious purpose — it is not either/or (Betty 1983). In fact, Nagarjuna’s religious objective is mystical — attaining a mindfulness insight through realizing that there is nothing in the phenomenal world that is permanent or ontologically separate to become attached to. Philosophers tend to equate mysticism with irrationality; so if Nagarjuna was rational, he was not a mystic (Garfield & Priest 2003: 9-10). But mystics in general are more rational than is generally believed. (See Jones 1993b.) Mystical writings can also be rational and logical even while requiring a personal mystical experience as necessary to realize that an ultimate truth-claim (paramarthasayta) is in fact true of reality. That is, seeing the phenomenal world as it really is (tattva) — i.e., realizing emptiness firsthand — requires a state of consciousness in which all frames of reference are in abeyance, including even emptiness itself. The world does not disappear in this state, as with a depth-mystical experience in Advaita Vedanta. Rather, only a sense of discrete entities disappears. (See Jones 2010 for the two types of mystical experiences.) In this state of mindfulness, there are no reified objects, but there still are sensory phenomena. Sense-consciousness is simply no longer directed by our conceptualizations. And there is nothing inconsistent or irrational in using arguments to aid in attaining a state of consciousness where we see the world differently than in our ordinary state of mind and where we are no longer attached to the objectifications that our mind makes in its ordinary state.

Language and the analysis of concepts figures prominently in Nagarjuna’s thought, and he may have been influenced by Indian grammarians. But trying to see him as a modern linguistic philosopher would be a mistake: we would end up placing him in a favored category rather than seeing him in his own terms. Scholars today may see him as a good modern “empiricist” or “pragmatist” or “postmodernist” (as Jay Garfield and C. W. Huntington do), just as scholars in the past saw him as the exemplification of whatever they considered the ideal for a philosopher to he (Tuck 1990). (For the same reason, we should not think of his Buddhist opponents in Western terms such as modern philosophical “realists.”)

But Nagarjuna does not fit neatly into any Western category of philosophers. He is not a “nihilist” in either values or ontology. Nor is he a “skeptic” in denying the self-existence of entities (bhavas): he claims to have knowledge of the fundamental nature of reality as it really is; he makes ontological claims and is not doubting that something is real or questioning his own metaphysics; nor is he claiming that something real is unknowable or that knowledge in general is impossible. (See Burton 1999:17-43.) Nor is he a relativist who claims that all truth-claims are equal. Nothing suggests that he had an “obvious abhorrence of all definitely stated doctrines’ and ‘true conclusions’ (contra Huntington 2007: 111). We might label him a radical nominalist, but his metaphysics is not one of a plurality of ultimate individual things as with Western nominalists. Indeed, applying any Western label to him will lead a reader to think along certain lines based on the history of Western philosophy, and that would be an instance of perceiving reality through a preconceived lens — precisely the type of practice that Nagarjuna is arguing against.

Nagarjuna’s Ontology

The basic Buddhist metaphysics is one of “becoming.” It emphasizes change and the interconnectedness of things in the phenomenal world. The fundamental components of this metaphysics are the dharmas — momentary “atoms” of experience, not materialistic objects. And, contrary to many commentators, Nagarjuna has a specific ontology based on Buddhist notions of becoming: a metaphysics of emptiness (shunyata) that contrasts with a metaphysics of self-existence (svabhava) that he ascribes to Abhidharma. He sees the Abhidharma Buddhists as derailing Buddhist metaphysics by making the dharmas, as well as everything else in the phenomenal world, self-existent. According to him, the Abhidharmists’ notion of self-existence entails a world that is permanent, unchanging, and disconnected. (Whether Abhidharmists really accept this will be questioned below.) Nothing would arise or cease (MI< 24.16) or otherwise change. Each thing existing by its own nature must remain the same: if it could change its character, it would not really have its
own nature. This produces a world with no continuity but merely a collection of disjointed entities. Cause-and-effect is impossible (MI< 24.17). Every thing is a discrete, self-enclosed entity that exists on its own and so cannot interact with anything else. To Nagarjuna, this means that the world of svabhava metaphysics would not work. That is, nothing could proceed in the world the way we see it that does if entities, properties, actions, and agents were self-existent because there could be no changes.

Nagarjuna accepts self-existence, lack of change, and permanence as the legitimate criteria for what is ultimately real (i.e., has “being [sat]”). This is also the criterion adopted later by Advaita Vedanta. Advaitins conclude that the world is an illusion while a transcendental reality (atman/brahman) does satisfy this criterion and so is real. It is important to note that Nagarjuna is only concerned with the world of everyday phenomena, not a transcendent reality like Advaita’s Brahman. Nagarjuna’s metaphysics is confined to this world and what we experience in the world. But, as with the Advaitins, Nagarjuna concludes that nothing in the phenomenal world—including ourselves—is real by this criterion since we experience constant change. Advaitins contrast the changeless self (atman) with the changing phenomenal self (jiva), but Nagarjuna sees his opponents committed to a changeless realities within the phenomenal world.

The only alternative to a phenomenal world of svabhava metaphysics according to Nagarjuna is a world empty of self-existence—i.e., emptiness (shunyata). A world free of any abiding, self-existent parts can proceed the way we see it doing: things constantly changing, interacting, being causally efficacious, arising, and ceasing. What arises from causes and conditions is neither the same as, nor different from, those causes and conditions. Nothing exists in and of itself. Nothing has a self-given existence or nature. Nothing real is involved. There are no real (self-existent) causes or effects; no real persons who are bound or liberated; nothing real that is pure or impure; no real attributes or characteristics to “mark” something; no real actions. Nothing ceases or is eternal (MK 17.7-10). The phenomenal world is a series of impermanent and interconnected parts, and the series itself is also devoid of anything permanent and eternal; hence, it too is not real in that sense. Indeed, from the highest point of view, there is neither permanence nor impermanence since there are no real (self-existent) entities that could be either permanent or impermanent (SS 58). In addition, if there is no “permanence,” there is nothing to contrast “impermanence” with, and so there is nothing properly described as “impermanent.” Thus, under either metaphysics there is no real change (including arising or ceasing [e.g., MK 20.17-18, 24.22-23]); under svabhava metaphysics, real things are permanent and immutable, and so cannot change, under shunyata metaphysics, things are empty of self existence and so there is nothing real to change, nor are any changes themselves real (MK 13.4).

Being empty of self-existence is how reality truly is (tattva, yatha-bhutam). Thus, phenomenal reality’s ultimate nature is the absence of any svabhava-like nature. It is beyond “is-ness” and “is-not-ness” (R 61-62) since these views are connected to svabhava. That is the nature of things—to put it paradoxically, things’ nature is “no nature.” But to put it that way is still to be thinking in terms of “nature,” which remains related to something existing by svabhava, and that is to be on the wrong track. Phenomena depend on causes and conditions; they do not exist through their own self-existence, nor are they totally nonexistent, but are something in between. An actor and action are interdependent and thus neither can be established as real (MK 8.12). It is a middle way between eternal permanence and complete annihilation (e.g., MK 8.14; R 46).

The phenomenal world under an emptiness metaphysics is impermanent, constantly changing, and interconnected. It is unarisen and unceasing (MK 18.7) because there are no real entities in the world that could arise or cease. For the same reason, it is neither eternal nor annihilated (MK 18.10). It has no unchanging, self-existent core, and thus is the opposite of anything existing by svabhava: it is free of any abiding substance or unchanging “essential” properties. Nor is it constructed out of discrete parts; thus, it is “clear” of differentiations that could be “grasped.” It is not dependent upon another, “peaceful” or “still” (since it is free of distinct parts banging into each other), free of conceptual projections or the thoughts that make distinctions, and without the multiplicity of distinct entities (MK 18.9). It is not one, not diverse, not annihilated, and not eternal (MK18.10). Phenomena that arise dependently upon another thing are not identical to that thing, nor are they completely distinct from that thing; thus, they are not something that is either annihilated or eternal (MK 18.10).

As previously noted, phenomenal reality is a series of svabhava-free, momentary parts, and the series itself is not a permanent entity. That is, Nagarjuna is not treating the whole of the natural realm as self-existent: if all its parts are empty of self-existence, then so is the whole. Indeed, he is not endorsing any type of holism: any whole is not a self-existent entity—the whole depends on the parts, and since the parts are empty so too is the totality of the parts, as he discusses concerning series (e.g., MK 17.7; SS 22cd). He imputes self-existence metaphysics to any other way of looking at things. The same holds for any continuum of events we divide into discrete segments with our concepts. For example, if who is born is not dying, then they are born deathless (see MK 13.3-6), and so can never die.

It should also be noted that Nagarjuna’s characterization of reality is not totally negative: by equating emptiness with the Buddhist theory of dependent-arising (MK 24.18, W 70 Comm.), he is giving some substantive characterization of how reality works. Nagarjuna gives no defense for equating emptiness with dependent-arising. He simply states that the two are the same (MK 24.18). He did not have to defend his equation in works addressed to other Buddhists. Nevertheless his maneuver makes emptiness a substantive metaphysical claim about reality, not merely a general metaphysics of...
impermanance and conditionality or a general assertion of the absence of svabhava. And if “dependent-arising” here means the full twelve-step formula of MK 26 rather than the general idea of conditionality or the formula “this arises dependent on that,” then rebirth and the Buddhist theory of how rebirth occurs become part of “how things really are.” But obviously we cannot go simply and directly from his analysis of concepts and his appeal to our observation of change to the idea of rebirth, let alone the Buddhist explanation of how rebirth occurs in the formula of “dependent- arising.” It certainly cannot be defended simply by defining “emptiness” to be “dependent-arising.”

It is important to note that Nagarjuna is not denying the existence of a reality independent of our consciousness — our consciousness may divide the world up into nonexistent, discrete objects, but there is something there to divide up. Nagarjuna is an linguistic anti-realist in the sense that he believes the world does not correspond to the conventional entities we carve out of the phenomenal world through our conceptualizations and language, but he is not an ontological nihilist who argues that there is nothing to reality. That is, there is something real (tattva) even if we project unreal entities (bhavas) onto it, and so Nagarjuna is a realist in that sense. (Also, under his method of analysis one cannot be an anti-realist without first establishing realism.) He explicitly distinguishes emptiness from annilation (uccheda) (e.g., MK 17.20; R 386). But he has been accused of being an ontological nihilist from his own time (R 119) up to today (Wood 1994). Following the same criterion of what is real as Nagarjuna claims, these critics conclude that the lack of self-existence means complete nonexistance. That is, emptiness entails, not simply that all entities are not real in the sense of “self-existent,” but that literally nothing exists in reality. Reality consists of nothing but fabrications. Everything is like the nonexistent horns of a rabbit. The basic dharmas are not only “insubstantial” but do not exist in reality or even appear (Wood 1994: 2). (That the Sanskrit word “shunya” is also used for zero in mathematics probably did not help his case: it means “nothing.”) This, incidentally, is behind the classical Greeks’ rejection of the zero in mathematics: “zero” means “nonexistence,” but if we use it in our mathematics then it must exist, and that they saw as a blatant contradiction — how could the nonexistent exist?)

Every agrees Nagarjuna rejects entities (bhavas) as self-existent realities, and this can be generalized to the claim that he rejected every possible object of thought as self-existent. But he tries to counter the accusation that he denies any reality at all. For example, in jewel Garland of Advice 50 he says that “seeing how causes and effects arise, one does not assert the doctrine of nonexistence but asserts that the nature of the conventional cosmos is born from conceptual projection (prapancha).” Not only does he not deny a reality apart from our conceptions (tattva), he also does not deny the existence of everyday entities in the conventional sense or of underlying dharmas — he only denies that they are self-existent realities rather than dependently arisen. That is, there are no self-existent entities, but the phenomena behind our conventions are there. The phenomena are there, but the alleged entities are not “real” in the way Nagarjuna alleges adherents of a self-existence metaphysics believe — their ultimate nature is to be free of self-existence. The notion that they are real arises from our discriminating consciousness and is solidified by language, but conventional entities nevertheless arise dependently and thus are not nonexistent.

If Nagarjuna wanted to deny reality to the world independent of our conceptualizations, he could have called it non-existent (asat) or have said that there is no such reality (na-asti, na bhavati), but he did not. He could use the standard Indie examples of “the horns of a rabbit” or the son of a barren woman” for alleged entities (bhavas), but he never uses these as analogies for what is empty or what is real (tattva). Instead, for what is empty, he uses analogies that involve some realities — mirages, illusions, reflections, dreams, magical tricks (MK 7.34, 17.31-33, 23.8-9; W13 Comm., 23, 65-67; R 52-56; SS 36, 40-41, 56, 66; YS 15-17, 27, 45, 54, 56). In these examples, appearances depend on something real behind them — e.g., a reflection must be reflecting some real object, a magical trick is created by a real magician, and the content of a dream is unreal but the dream itself and the dreamer are real. Things are thus dependent on something real.

What ceases with knowledge is the sense of self-existent entities, not what is really there — sense-experience still occurs, but the enlightened do not structure it in terms of discrete realities. They see reality as it really is (tattva). Apprehending things as they really are through knowledge (vidya) has replaced their perception deluded by the root-ignorance (a-vidya). Whether the analogies Nagarjuna gives are really apropos is debatable. For example, an illusion is corrected through closer examination by another perception, but seeing things as self-existent is not corrected by another perception. Things look the same to the enlightened — even if they see some object plainly and clearly, they do not see the absence of self-existence. It is not as if closer empirical inspection would reveal that things are empty of self-existence. Experiencing the world free of all conceptual points of views is more like the conceptual switch from a Ptolemaic to a Copernican point of view: the sun still looks like it is moving, but our knowledge has changed.

Fables and chairs thus are unreal “fictions” but in a different way than a unicorn is. What is empty can have causal effects, just as illusions and nightmares can produce fear in the experiencer. Indeed, nothing in Nagarjuna’s accounts requires that he reject objective features and structures to the phenomenal world. In his analysis, there is still the perception, something to be perceived, and the perceiver. That is, the world is not an illusion all the way down, only constructs built upon other constructs. The unenlightened merely misread what is there and the status of appearances. In sum, simply because no entities exist by their own power — “all things are empty” — does not mean that he thinks there is nothing at all. (It should be noted that Advaita
Vedantins use the same analogies for the unreality of the natural realm [maya] in favor of the reality of a transcendental one [brahman], leaving the status of this realm as neither real [sat] nor unreal [asat] but undefined [anirvachaniya]. Nagarjuna too calls the world an illusion [maya] [R 109], but he does not address any issue beyond the reality of the phenomenal world [tattva] and the false creations we impose on it.

“Emptiness” is not a new substance experienced or a new object seen or a new “essence” of things. Rather, the term simply describes the state of phenomena as being devoid of anything that would give them self-existence or a permanent nature. In MK 24.18, Nagarjuna calls the concept “emptiness” an indicator (prajnapripti) dependent upon convention (see also MK 22.11); it differs from other ontological terms only in that there is not even a conventional object as its referent. It has no referent of any kind in the world, but again, the unenlightened will be misled simply by the term into thinking some real (self-existent) thing is indicated.

Thus, Nagarjuna treats “emptiness” like any other alleged entity: it too is empty. Thus, the “emptiness of emptiness” is not any esoteric, profound secret doctrine, or a paradox, or anything mysterious at all. Nor is it a special topic in any of these works. It is not a new, unique ontological claim or a separate doctrine. It is not referring to the way reality truly is (tattva) in a manner that “emptiness” does not. It is simply the statement that “emptiness” is like any other concept—empty. In fact, it is an obvious corollary of the basic doctrine. Hence, Nagarjuna does not need to say much about, and he does not. “Emptiness” is a convention as much as any other concept—it does not refer to any self-existent entity but is itself empty. It is not a self-existent Cosmic Void that is the source of the phenomenal world. It is not some type of new “essence.” Indeed, it is not a phenomenon at all—the term simply designates the true state of the world. To reify the mere absence of anything that could produce self-existence into a reality of any kind would make emptiness into a type of entity—and according to Nagarjuna, anyone who does this is incurable (asadhyan) (MK 13.8). Chandrakirti likens the situation to a man who, when being told by a shopkeeper “I have nothing to sell you,” asks the merchant to sell him the “nothing.”

Nirvana and Samsara

One consequence of the emptiness of things is that nothing is separate from the rest of the world or is of a different nature than anything else. Only self-existent entities can be either the same or different, and since all things are without self-existence, nothing can be either identical to, or different from, another thing. What arises dependent upon something else is neither the same nor different from that thing (e.g., MK 18.10). For example, butter coming from milk is neither the same nor different as the milk. A cause and its effect are neither identical nor different (MK 20.19). The Buddha and the aggregates are neither identical nor different (MK 22.1). The “self” of the present and past lives are neither identical nor different (MK 27.8), as are the person committing an act and the person enjoying the fruit (MK 17.28).

This means that even samsara (the cycle of rebirth or the entire realm of rebirths) and nirvana are not different. It is important to note that Nagarjuna does not say that nirvana and samsara are the same or identical, but only that they are not different in any way (MK 25.19-20). Scholars routinely say that he asserted that nirvana and samsara are identical (e.g., Garfield & Priest 2003:11), but he never says that and it is important to see why. Nagarjuna could have equated them by using the formula in MK 24.18, “Whatever is samsara, we call ‘nirvana.’” Or he could have followed the Heart Sutra from the Prajna-paramita tradition, and said “Samsara is nirvana, nirvana is samsara.” Or he could have said they were the same (e.g., samata, ekatva) or some other plain statement of identity if that is what he meant. But his metaphysics precludes anything like that: only a truly existing entity can be the same as, or different from, another truly existing entity (e.g., MK 2.21, 6.5; VV 67) — if all this is empty, there are no such entities (see MK 16.10, 18.10), and this means that nirvana and samsara are neither different nor the same. That is, since there is no self-existence, nirvana and samsara are not the type of things that could be either different or the same. Indeed, the nature of nirvana is the same nature as all things — unarisen and unceased (MK 18.7). Neither is a real (self-existent) entity, and thus neither is found (YS 4–5). Whatever is the self nature (svabhava) of the Buddha is the same nature of the world, i.e., lacking any self-existence (MK 22.16). Since the cosmos (loka) and nirvana are equally empty of self-existence, how can there be a real difference between them (R 64)?

Thus, Nagarjuna never equates nirvana and samsara. It is not as if the concepts mean the same thing or refer to the same thing. The point he is making is that nirvana and samsara, like everything else, have the same nature: being empty of self-existence. This must be a truth from the ultimate ontological point of view, since conventionally they could not be more different. But pointing out that nirvana and samsara are not the same would not be news to Buddhists — it is claiming that they are not different that is startling. To treat them as the same would be as much an error as treating them as different since we would still be thinking in terms of “real” (self-existent) entities rather than seeing their correct ontological status from the ultimate point of view. To combine parts of two verses: if all entities are empty, what is identical and what is different (M K 25.22-23)?

Knowing Phenomenal Reality

To Nagarjuna, we misperceive reality by seeing the world populated with distinct and independent objects. We do not merely have a mistaken idea but see things incorrectly. To use the common Indie analogy, it is like seeing a rope as a snake — there is something there, but we misperceive it. The snake is totally unreal (i.e., there is no real bhava), but there is something real there that is experienced (the rope). The
empirical basis for rejecting a svabhava metaphysics according to Nagarjuna is that we see change in the phenomenal world (e.g., MK 13.3-4) — nowhere is an entity found that is not arising and falling (MK 7.21, 7.24, 21.8). He does say that seeing arising and falling is the result of a delusion [MK 21.11], but his metaphysics defuses the apparent inconsistency: no self-existent, real entities arise or fall [see MK 5.8.] And just as there a reality underlying the illusionary snake that can be directly seen, so too there is reality (tattva) underlying our misperception of permanence that can be directly experienced. Seeing reality as it really is (yatathabhatum) requires seeing the change in the world without any recourse to alleged permanent entities or a permanent seer, ‘[his is not merely accepting the proposition that “all is impermanent” or that “change is constant” — with a little reflection, we may readily agree that all things, including ourselves, are always changing. Rather, we need to replace the active error impeding our vision (avidya) with a new way of seeing by removing any conceptualization. Most importantly, this is removing a sense of a separate self, but it also includes any sense of discrete objects in the world. Thus, the correct vision is free of all conceptualizing — if one sees someone as “free of a sense of self,” one still is not seeing correctly (MK 18.3). So too, if we see the phenomenal world as “empty,” we are still imposing a viewpoint on reality, i.e., seeing reality through a conceptual prism. In a related way, if we are aware of being free from passion, we are not in the proper emotional state beyond passion and impassion (YS 58).

The change here is not merely intellectual. The difference is between merely accepting the proposition and actually realizing that it is true of reality. To use a Buddhist analogy, the difference is between accepting the proposition that water quenches thirst and actually drinking water. Breaking the habit of seeing reality in terms of self-existent parts requires meditation and changes in how we lead our lives. It leads to a “mindfulness” insight into the nature of phenomenal reality, not a “depth-mystical” experience (see Jones 2010: chap. 1): it is an insight into the world of natural phenomena, not realizing an alleged transcendental reality. The ultimate nature of things is “unknowable” in one sense and “knowable” in another: it can be experienced and thus is knowable in that sense; but when seeing the emptiness of things directly, phenomenal reality as it really is has no objects to be grasped by the analytical mind, and thus it is unknowable in that sense. In the words of the Dalai Lama, “we cannot comprehend it as it is known in direct apprehension in meditation” (quoted in Garfield 1995: 325 n. 126).

Seeing reality as it really is creates a state of a person in which, according to Buddhists, one no longer generates the emotional afflications that in turn generate the type of actions (karma) that propel the wheel of rebirth. The “fires” of hatred, greed, and delusion are extinguished, and one has attained the passion-free state of nirvana and is free of rebirths. (Nagarjuna draws the common Mahayana distinction between attaining liberation from the wheel of rebirth [moksha] and attaining the full and complete enlightenment of a Buddha [bodhi]. Bodhisattvas forego the former to attain the latter and to aid all other sentient beings in attaining liberation.) Nirvana is not an entity (bhava) and hence it cannot be the absence of an entity (abhava) (R 42, SS 25). To Nagarjuna, nirvana in the end is simply the destruction of the notions of “entities” and “non-entities” (R 42; see also YS 5). Nirvana is not self-existent but arises dependency from what we do, even if the necessary insight cannot be compelled by any action, and thus ultimately it is without conditions and is non-dependent (MK 25.9).

Does Nagarjuna Have a “View” or a “Thesis”?

The final verse of the Fundamental Verses presents an issue: “I bow to Gautama the Buddha, who through compassion taught the true doctrine for removing all views (drishtis)” (Also see MK 13.8). So, is Nagarjuna claiming that he himself has no views (drishtis)? (See Garfield 1995: 353-59, 1996.) In addition, in (Overturning the Objections) he claims to have no thesis (pratijna) (vv. 29, 59 Comm.; see also R 60, VP 1 Comm., Westerhoff 2009: 183-98). In the jewel Garland of Advice, he speaks of propositions (pakshas) the same way (v. 104; MK 2.10; YS 50). However, in the same line of the Karikas where he speaks of removing all views (27.30), he speaks of the Buddhist doctrine (dharma). And in the Jewel Garland, he again claims to have no thesis to be defended but proceeds to discuss the Buddhist doctrine (vv. 60, 62). Thus, when he advances what looks like a philosophical thesis (“All this is empty”) and then denies he has any thesis, it has the paradoxical feel of someone talking and saying “I am not talking right now.” This all suggests that he paradoxically claims to have no views at all. That is, all views, including Nagarjuna’s, are relegated to the conventional level: from the ultimate point of view, even the claim “All this is empty” has to be rejected as simply being another view. In the direct experiential realization of the emptiness of things, all conceptual views must be given up — even seeing the world as empty — since the mind must be freed of all conceptualizations.

However, in the Karikas, Nagarjuna always connects “views” to “self-existence,” suggesting that it only claims qualify as the “views” that are to be removed. (E.g., MK 15.10, 21.14, 24.21, 27.1-2; see also YS 14, 23, 43-48, 50-51; R 104. In the more informal Jewel Garland of Advice [43-45, 57-58], Nagarjuna connects “false views” with the idea that karmic causes do not have effects and “right views” with karmic causes having effects, with right knowledge passing beyond both false and even right views. But he also connects propositions with existence and nonexistence [R 46, 50-51, 57-58.]) He also explicitly disconnects emptiness from “views” (MK 13.8), and emptiness is not connected to “is” or “is not” (MK 22.11; R 46,104-105).

Under this interpretation (which the Tibetan Geluk tradition endorses), Nagarjuna espoused philosophical positions — i.e., “views” in the nontechnical, everyday sense — starting with the first verse of the Karikas, but he had no
views in the technical sense of a position connected to self-existence. If he had a proposition (pakṣa), a counter-proposition would be derivable from it, but both would be false (R 104; YS 50). Nagarjuna is merely “making known” the emptiness of things without being committed to any view; the term is employed merely to inform us of the emptiness of things (MK 22.11, 24.18). He can say he has established the emptiness of things in detail while still maintaining that this is not a thesis (VV 59 Comm.) Emptiness cannot be used to refute views (MK 4.8) since it is a conclusion from other refutations, not a premise.

Thus, Nagarjuna can accept a particular ontology without having a “view.” It is not a matter of the “ultimate point of view” but simply not having any positions requiring self-existence. He also speaks of another type of seeing coming from the same root as drishti when he speaks of seeing reality as it really is — “tattva-darshana” (MK 26.10; see also MK 21.14, 27.14) — but he does not connect this to a view. Thus, he can assert a doctrine and dispute another without contradicting himself: he has a teaching or doctrine (vada) of emptiness (W 69) and a point of view (darshana) and the Buddha had a doctrine (dharma), but he has no view (drishti). The alternative to holding a thesis is not another thesis but another type of doctrine rejecting all theses. In sum, drishti is a term of art for claims of a svabhava metaphysics, not any type of “view” in the everyday sense.

It may be that both senses are involved: from the conventional point of view, it is only the false views that are to be removed; from the ultimate point of view, all views are. As the Dalai Lama says, the first interpretation makes more sense from the standpoint of philosophy and for the purpose of characterizing an inferential understanding of emptiness, but the second interpretation is a better expression of the nature of the direct understanding of emptiness that is needed and may be more useful for guiding meditative practice (Garfield 1995: 353 n. 137). This would mean that the truth of Nagarjuna’s propositions about the emptiness of reality is not in any way doubted, but to realize they are true — to see reality as it really is — all points of view or perspectives must be in abeyance. That is, a drishti is a metaphysical point of view that affects our view of things, but we need to be free of all frameworks — including the correct framework of emptiness — to see the world as it really is. Thus, when Nagarjuna says “This world is devoid without self-existence” (MK 22.16), there is no qualifications to suggest that it is anything but the absolute truth from the highest point of view — indeed, it is false from a conventional point of view. Or when he gives the characteristics of true reality (tattva) (MK 18.9-11), again there is no qualifications, and the characteristics are again false from a conventional point of view. But if “drishti,” “pratijña,” and “pakṣha” are terms of art connected to svabhava and thus sat, then propositions such as “All this is empty of self-existence” or “All dharmas are empty of self-existence” simply do not qualify as views or theses in Nagarjuna’s technical sense.

Either way, Nagarjuna does not reject all philosophical propositions but only those connected to svabhava and sat. The three important points are first that emptiness is not an entity of any type or its absence and we cannot have a “view” about it. Emptiness is the conclusion reached when svabhava has been rejected, and thus is not itself a “thesis” to be defended. Second, we need to get beyond the conceptualizing mind — including the framework of emptiness — to see reality as it truly is. And third, nothing in his works suggests that ultimate truths are in any way false.

The Two Types of Truth

The last point leads to the central role that the two types of truth play in Nagarjuna’s arguments. (See MK 24.8-10, MK 24.36, VV 28, SS 1, SS 69-73, YS 30-33.) In the more informal jewel Garland 360-365. Nagarjuna contrasts what is “in fact real” or “really the case” (arthatas) with what is “worthless” or “pointless” (vyarthavam). The idea has roots in the earlier Buddhist idea of texts of final meaning (nitartha) and those of provisional meaning (neyartha). Ultimate truths (paramarthatas) are truths about things in this world from the point of view of ultimate ontological status, while conventional truths (loka-samvriti) are about what counts as real depending on our conventions. “Conventional truths” are determined by any worldly practices and conventions, not just language. Buddhist insight is into the phenomenal realm, and ultimate truths are about the same phenomenal realm as conventional truths, not about an alleged transcendental reality. Ultimate truth “denotes the way things are independent of convention, or to put it another way, the way things turn out to be when we subject them to analysis with the intention of discovering the nature they have from their own side, as opposed to the characteristics we impute to them” (Garfield 1995: 298).

Ultimate truths are not merely the same as conventional ones but seen correctly — i.e., knowing that there are no self-existent realities involved.

Rather, they state what in the final analysis is the ultimate ontological status of what is being discussed. These truths are not open to any further analysis, while the subjects of conventional truths are open to deeper analysis (Tsering 2009:10). Conventional truths the about the content of the world of appearances, while ultimate truths are about the ontological status of those appearances. The claim that nirvana and samsara are not different in nature (MK 24.19-20) is the quintessential ultimate truth. It conceals nothing. Ultimately, worldly phenomena are void of self-existence and arise dependently — no deeper truth about their status is possible. MK 1.1 on entities not arising is a conventional truth (Wayman 1969:149-50) since it is about the relation of entities; the ultimate truth is that there are no real entities. Conventional truths involve our worldly categories. But ultimate truths too depends on our conventions (MK 24.10, VV 28): without recourse to our conventions, these truths could not be taught or even stated.
With this framework, Nagarjuna can maintain both the supremacy of emptiness and all conventional matters. All is empty, but the world is still a world of plants and animals, tables and chairs, even if there are no discrete, self-existent entities. Dependent-arising is affirmed, but according to Nagarjuna it only works if things are empty (SS 71). What is real from a conventional point of view is discrete and permanent (and hence self-existent); from the ultimate point of view, what is real is empty. This leads sometimes to Nagarjuna affirming something from a conventional point of view, or assuming some phenomenon to be conventionally real, and elsewhere denying the same thing from an ultimate point of view. Some things are not true from either perspective — e.g., from either point of view, there is no real change or arising or ceasing. But the context in which a truth-claim is made is important in most instances, and without the two types of truths he would be contradicting himself.

To Nagarjuna, the phenomenal world is only a matter of conventions (R 114). In the conventional sense, there are entities, properties, relations, and processes. So does a table exist? There are two answers depending on the context. A table exists conventionally but not ultimately (since it is empty from the ultimate point of view). Some phenomena exist in the ultimate sense, but the table does exist conventionally in a way that a unicorn does not — there is something there (tattva). So too, veridical perceptions see something about reality that delusions and optical illusions do not, even though the former are framed in terms of self-existent entities. We can use conventions to state something true about the world — e.g., “The Hudson River is in the eastern United States.” That is true even though there are no “rivers” and no “United States” and “eastern” depends on a convention. But the sentence still says something true about the content of the phenomenal world that the sentence “The Nile River is in the eastern United States” does not. It is misleading (i.e., “false”) only in the ultimate metaphysical sense since there are no real referents; thus, a deeper truth about the status of “river” and “United States” is also possible.

Language and Ultimate Truth

Can ultimate truths be stated? Most scholars say “no.” When the analytical mind is in play, ultimate truth is impossible. But consider the claim “All this is empty.” That is an absolute truth. It is not a conventional truth but an accurate statement about the ultimate state of things and is not open to any further qualification. In fact, the ultimate truth (paramartha) consists of the teaching of emptiness (SS 69). It must use our conventions (MK 24.10, VV 28), but it is not thereby reduced to a conventional truth — it still states something ultimately true about the ontological status of things that is not subject to any further revision. Nothing in Nagarjuna’s philosophical writings justifies claiming that ultimate truths are unstable or that from the highest point of view saying “All this is empty” is inadmissible because there are no real referents. True, Nagarjuna would say that words and statements cannot correspond to reality as it really is (tattva) because reality is not cut up into distinct object and thus there are no “real” (self-existent) referents for our words. Nagarjuna thus would have rejected a “correspondence theory of truth” for truths from the ultimate point of view since they are no “real” discrete objects in the world for our words to mirror [see VP 73 Comm.]. However, what he writes does not justify concluding that he rejects truth-claims. (Nor does the rejection of a correspondence theory of truth mean that he would necessarily have accepted a “coherence theory of truth” simply because all concepts are conventional — he does not advance any theory of truth. In fact, he might have accepted a correspondence theory of truth for conventional truths — he simply did not present anything we would recognize as a modern epistemology.)

And it is true that realizing the reality is empty is more than merely understanding and accepting the claim — it requires being free of any framework that would enable us to generate words. But “realizing ultimate truth” should not be conflated with “ultimate truth” — the experiential insight that “All this is empty” may be free of conceptualizations, but this does not mean that the statement “All this is empty” is not the ultimate truth. That is, stating an ultimate truth is not the experience showing that it is true, but it is still an ultimate truth and it is still statable by recourse to the conventions of language. The analytical mind can comprehend the truths, even if a state beyond the analytical mind is needed to become enlightened. (See Tsering 2008:120-21.) Thus, ultimate truth still involves a conceptual framework but the correct one in terms of emptiness, and to realize the truth we must forego even this conceptual framework. Quenching our thirst with a drink of water is not a linguistic event, but this does not make the claim “Water quenches thirst” in any way untrue.

The problem for Nagarjuna is not language per se, but our mental discriminations (vikalpa) and projections (prapancha) (MK 18.5,18.9, 22.15, 25.24). Our mental fabrications reflect a false world of multiple entities. But he never gives a blanket condemnation of all language while offering emptiness as the way to still the mind of vikalpa and prapancha. In fact, all Nagarjuna says concerning language relates to three things. First, no real referents exist in the world for words to denote — names and what is named do not exist from the ultimate point of view (VP 73 Comm.). Second, concepts operate by contrasts. And third, all statements are empty of self-existence, but they still can function (e.g., VV 21-22 Comm., VV 57 Comm.).

Because everything is empty, there is a problem even referring to “self-existence” or “emptiness.” To have a concept for x, we need something non-x to contrast with it. Nagarjuna would also add that non-x is derived from x; so without x there can be no not-x. Without such a contrast, we would never have a reason to make up a concept. For example, if the universe were entirely blue, we would see no contrasting color and so we would have no word “blue” to distinguish the color of the universe from other colors. Arguably, the word “blue” would have no meaning if we could not contrast it with something and thus have something specific to apply it too.
(Hence philosophers’ trouble with the concept of “being.” See Jones 2009: 25-28.) And since there are no self-existent things, how can there be the opposite (the empty) exist either? Or if nothing is permanent, what could we call impermanent (MK 23.15-16, 27.20)? Or if there is nothing real that is conditioned, there is nothing “unconditioned” either (MK 7.33). Moreover, the terms cannot apply if there is nothing real. Thus, if there are no self-existent things, then there is no reality that could be empty (nor is there anything self-existent to contrast with it). And even calling what is empty “something” in Nagarjuna’s eyes means we are still thinking in terms of self-existence.

This means that what is real is, from the conventional point of view of entities, inexpressible. Hence, the Buddha is the “silent one (muni)” who did not teach anything real (self-existent) (MK 22.3-4, 25.24) despite all of his discourses. After a passage on prapancha and vikalpa, Nagarjuna says that when the domain of the discriminating awareness (citta) has ceased, then what can be named has ceased and that the nature of all things is unarisen and unceased (MK 18.7). But this means only that there are no real entities in the phenomenal world to name, and reality as it is (tattva) is not reflected in language. He is not ending the text there, nor do he ever say that silence is required. The enlightened do not have to abandon language, even though ultimate truths is dependent upon conventions (MK 24.10). They can still use conventional language to state the ultimate truth of emptiness, but they are not misled into thinking that the world is populated with discrete, permanent entities corresponding to our conventional terms. Stating an ultimate truth involves concepts, but it is not a view (since no metaphysics of self-existence is involved), and so the enlightened can state it without clinging to a view.

It is the unenlightened who discriminate discrete objects (vikalpa) and thereby create a false world: to them, if we have a word for something, there must be a distinct reality to be referred to. Thus, they project categories onto the world, the process that creates a false world of reified entities (see MK 22.15). But language per se does not need to lead to thinking in terms of discrete entities. To use Bertrand Russell’s example, just because we say “it is raining,” no one thinks there is an “it” that does the raining — there is just the raining. And the enlightened can react to all nouns the same way. Language is like a map: a map makes what is mapped into a flat world of discrete objects with crisp boundaries, while what is mapped is not actually like that. But this does not mean a map is not useful, and the same is true with language. The enlightened can use words referring to themselves without the seeing the world in terms of “I” or “mine” or “selves” (e.g., YS 33). Nor does the enlightened perspective in any way relativize meaning. Labels are not arbitrary: calling a car a “bottle” or a “pen” is not merely “inappropriate” but wrong.

The Buddha expressed reluctance on espousing how things really are. (See Kalupahana 1986: 331-32.) But Nagarjuna does state how things are “from the point of view of reality” (tattvatas) — i.e., from the point of view of how things really are, and not merely pragmatically from the point of view for gaining the highest fruit (parama-artha). His constant use of tattvatas in the Jewel Garland of Advice is most plainly seen as meaning that those statements are unqualifiedly true. It is hard to argue that the basic claim “All this is empty” is not an ultimate truth since it is false from a conventional point of view — from a conventional point of view, the world is populated with distinct entities that are realities unto themselves. So too, the principle “This arises dependent upon that” is not denied even though what arises depends on itself and thus is not real (SS 71). The use of conventions does not transform the claim “All this is empty” into a conventional truth. The statement involves our conventions (vyavahara), as Nagarjuna says is necessary (MK 24.10, W 28 Comm.). But the truth about phenomena being empty is a final, unqualified, and eminently statable truth. “Emptiness” is only an indicator (prajnaaptir) (MK 22.11, 24.18). There is no real, self-existent entity in the world called “emptiness,” but the concept can be used to point out something true about reality.

Realizing the truth that all is indeed empty is difficult; meditation is required to see that all phenomena in the world are in fact impermanent and conditioned. Only part can be pointed out in words (W 70 Comm.) since an experiential insight is needed. This may require a state of consciousness where our linguistic abilities are temporarily in abeyance. But even if realizing or apprehending the final truth is “beyond language” and “inexpressible,” stating the final truth is possible (contra Garfield 1995: 252) — the truth is not in some sense ineffable simply because all referents are by definition conventional (contra ibid.: 275). Scholars may want to see all Indie philosophy and religion in terms of ineffability and silence, but nothing in Nagarjuna’s writings suggests the enlightened are reduced literally to silence or that silence is the “highest truth.” We cannot conclude from what Nagarjuna actually writes that “the ultimate truth is that there is no ultimate truth” or that “all truths are merely conventional” or that “there is no such thing as ultimate truth” or that “ultimately, one is left with only conventional truth” or that “the conception of truth supported by the way things really are presents a subtle object of clinging” (contra Garfield & Priest 2003: 10; Westerhoff 2009: 220, 224). What is ultimately real seems “inexpressible” from a conventional point of view since we think in terms of discrete entities and in fact there are none. But from an ultimate point of view, this is not a problem: the enlightened know there are no entities and can resort to language without projecting a statement onto reality and creating a false world of multiple entities. The ultimate nature of things may be unknowable in the sense that we cannot know it the way we know objects in ordinary consciousness — i.e., by making an object out of what is real that we can grasp. But this does not change the fact that some of the ultimate nature of things can be stated: the world’s phenomena are empty of anything giving them self-existence.
Indeed, if the ultimate truth is not statable, what does Nagarjuna mean when he says that ultimate truth relies on the conventional? If he had said realizing the ultimate truth relies on conventions, then we could say conventional truths only direct our attention to the ultimate unstable truth, but MK 24.10 states that nirvana cannot be attained without understanding from the ultimate point of view. That is, there are three things mentioned in the passage: conventional truth, ultimate truth, and realizing enlightenment. Thus, he is distinguishing attaining enlightenment from what is a category of truth (satya, 24.8). Even if realizing enlightenment requires a wordless experience of the phenomenal world, this leaves the statements of ultimate truths untouched: he never says ultimate truths cannot be spoken.

Is Nagarjuna Illogical?

Scholars have studied the logical structure of Nagarjuna’s arguments and have been across the board on how they see his relation to logic — he is seen as everything from not understanding logic to denying logic altogether to advancing a new three-valued logic. Was he “obviously and profoundly distrustful of logic (Huntington 2007:111)”? Did he reject the law of the excluded middle (Staal 1975: 39)? Doesn’t the denial of one position logically commit Nagarjuna to holding the opposite (which he also denies)? Did he “use logic to destroy logic”? Was he simply inconsistent or irrational — e.g., at some places he affirms entities and at others he denies them, or he claims that what is dependently arisen is unarisen (YS 48), or he contradicts himself by resorting to a view to destroy all views (Betty 1983: 128). Many of these alleged inconsistencies disappear through his use of “two truths” and “views.” Thus, we may pay attention to the total context of a remark. Nor does he write anything in any of these works that suggests that he is relegating rationality to the conventional level of truths or introducing a new multivalued logic. In fact, it appears that Nagarjuna does not violate any of the usual laws of logic nor is he in any other way irrational.

Consider two basic laws of logic: the law of the excluded middle (everything is either x or non-x), and the law of non-contradiction (nothing can be both x and non-x). We believe these laws apply to all thought — e.g., how can someone believe that a statement is both true and false? How can a statement be intelligible with them? (But see Priest 2004.) And if we examine Nagarjuna’s arguments, we see that he implicitly relies on both. Not that he ever mentions such laws. In fact, he never discussed logic — theories of what is a valid inference or deduction — or why these laws should be accepted. And it is important to note that, unlike Western philosophers, Nagarjuna speaks of a conflict of properties, not statements — i.e., he says that something cannot be or have x and non-x or that x and non-x cannot be in the same place at the same time, not anything about the relation of statements. His focus is on the world, not the logic of statements.

Many of Nagarjuna’s arguments proceed on the basis that x and not-x are mutually exclusive and that there is no third possibility. For example, the law of the non-contradiction in MK 8.7 (also see MK 7.30, 21.3, 25.17, 25.25-27; R 4): “real and ‘unreal’ are opposed to each other — how could they exist together simultaneously?” Obviously, an entity (bhava) and its absence (abhava) cannot exist together (MK 25.14). So too, he implicitly utilizes the law of the excluded middle in MK 2.15 (see also MK 1.4, 2.8, 3.6, 4.6, 6.10, 8.1, 21.14; VP 50, 58, 59): “A mover is not stationary, just as a non-mover is not stationary. And other than a mover or a non-mover, what third possibility is stationary?” Indeed, Nagarjuna’s basic method of arguing can proceed only if the contrast between x and not-x is exclusive and exhaustive.

However, not all cases of x and not-x in Nagarjuna’s works are like that. In some instances, x and not-x are connected and not exhaustive — in particular, “bhava” and “abhava.” An abhava results from a bhava, and something can neither a bhava or an abhava — e.g., nirvana (R 42, SS 25). Thus, denying the existence of a bhava in no way logically requires affirming an abhava. So too, the contrast between “existence (sat)” and “nonexistence (asat)” as he defines the terms is not exhaustive but only shows extremes: existence is eternal existence (and hence unceasing), and nonexistence is total nonexistence (and hence unarisen) — thus, something that comes into existence or did exist but comes to an end does not fall into either category. But what he wants from this is the fact that we see things arise eliminates “nonexistence” and the fact that we see things cease eliminates “existence.” That is, he wants a third category between eternal existence and total nonexistence — what is “empty.”

Nagarjuna also employs the simplest form of an inference, recognized in the West as modus ponens (e.g., MK 19.6):

1. If A, then B;
2. A;
3. Therefore, B.

He also uses the more complex modus tollens (e.g., MK 24.24, 27.7):

1. If A, then B;
2. Not B;
3. Therefore, not A.

For example, if (A) there were self-existence, then (B) there would be no change (since change of any kind is impossible for what is permanent); but we see change (not B); and so, there is no self-existence (not A). Such reasoning is valid and is a standard feature of Western philosophy and logic.

But Richard Robinson thinks that Nagarjuna violated one law of logic (1957: 297). Verse 13.7 of the Karikas reads: “If there were anything at all that is not empty, then there would exist something we can call ‘empty.’ However, there exists nothing non-empty — how then can there be the ‘empty’?” This and other verses of the same form (MK 10.7, 7.17) can be interpreted as violating a law of logic — the law of
contradiction or the fallacy of the antecedent. It has this logical form:

(i) If A, then B;
(ii) Not A;
(iii) Therefore, not B.

It has the same logical form as “If it is sunny today, it is not raining; it is not sunny today; therefore, it must be raining.” Obviously this is wrong — it can be cloudy but not raining. However, Nagarjuna’s verse can also be given a reading that does not violate logic: the concept of “emptiness” is tied to the concept of “a self-existent entity” — i.e., the one idea is dependent upon the other. Thus, if and only if the latter reality does not exist (i.e., if there is nothing that is self-existent), then the former cannot exist either (i.e., there is nothing empty), then there is no reality that can be empty. In short, the verse is only about the interconnection of concepts. It has nothing to do with the fallacious type of inference and does not violate any law of reasoning.

Nagarjuna also uses a form of inference to make a point (MK 4.4, 13.4, 15.9, 20.1-2, 20.21, 21.9, 25.1-2, 27.21, 27.23-24). The form is:

(i) If A, then not B.
(ii) If not A, then not B.

The point he is making that whether A or not A, there is no B — e.g., whether or not self-existence exists, change is not possible. He also uses this to reply to his opponent — i.e., the opponent speaks the first line, and Nagarjuna replies with the second (e.g., MK 20.16, 25.1-2).

Nagarjuna also employs what is known as the “tetrelemma (catu-skoti),” although he never uses the word in his writings (MK 12.1,18.8, 22.11-12, 25.15-18, 25.22-23, 27.13, 27.20; see R 106,115). Here he denies four options:

(i) A exists;
(ii) A does not exist;
(iii) Both A exists and A does not exist;
(iv) Neither A exists nor A does not exist.

It is not a fixed form — sometimes we have to put a number of verses together to get all four options (MK 25.4, 7.11, and 15); often there are only the first three (MK 1.7, 2.24-25, 5.6, 8.9-11, 21.13, 23.20; R 37; SS 4, 44; VP 4, 51, 56, 73); and once there are five options (W 51 Comm.). Indeed, the very first verse of the Karikas can be seen as the four options since “no cause” can be most easily interpreted to mean “neither self-caused nor caused by another” (see also W 51).

Philosophers have expended a lot of ink applying symbolic logic to these denials to try to see how they are not paradoxical. Doesn’t the denial of the first option logically commit the holder to the second? How can someone deny that something neither exists nor does not exist? Is the negative the “contrary” of the positive rather than its “contradiction” (thereby allowing more options in between)? The denial of the fourth option makes Nagarjuna look as if he is denying the basic law of non-contradiction.

But the efforts to apply symbolic logic to the four options to save Nagarjuna make him too sophisticated. (This is not to say that we cannot employ modern logic to show that his conclusions are correct. [See Jones 1993a: 260-61 n. 6.] But doing this is not the same as claiming that this is how Nagarjuna actually reasoned.) More importantly, such arguments miss the point: Nagarjuna is trying to state that we cannot think of anything in terms of self-existence. He uses the form of the four options simply to try to cover all positive and negative possibilities — i.e., he is saying there are no other options. He wants to cover all possibilities so that all claims involving svabhava in different contexts are eliminated, and thus only emptiness remains.

And it can be shown easily enough without resorting to technical rules that the “four options” approach is not logically contradictory. For example, if someone asks what color the number 4 is, we might say “It is not blue, not a color other than blue, not both blue and another color, nor neither blue nor another color.” All four denials are true and consistent since numbers do not have color. The denial of any option does not logically commit someone to any other position on the color of four. We might think that the last option applies — “neither blue nor another color” — but in Nagarjuna’s framework, as long as we are thinking in terms of color we are on the wrong track regarding the nature of numbers. So too, with the four options regarding whether something “exists”: to Nagarjuna, only something that is self-existent can exist or not exist, and so as long as we are thinking of phenomena in terms of “self-existence,” we do not understand the true nature of reality but are thinking along conventional lines and thus in terms that cannot apply. To expand Bertrand Russell’s example of “The present King of France is bald”: it is wrong to answer “yes” or “no” or that “he is both bald and not bald” or that “he is neither bald nor not bald” since he does not exist. To use the Buddhist analogy, it is like asking what direction a flame goes when a Fire goes out — any answer shows that we are thinking along the wrong lines (that the flame still exists). So too, the denial of all four options is consistent if there are no self-existent realities. For Nagarjuna, only an entity existing by self-existence could the subject of the four options.

In sum, all Nagarjuna is saying is that the subject to each option does not exist. In addition, he treats the fourth alternative as a type of thing — if nirvana is neither an entity nor a non-entity, then it cannot be a “neither-an-entity-or-a-non-entity” (MK 25.16). Such an entity is the kind of an entity that contrasts with the third option: if we can establish something that is “x- and-non-x,” then we can establish what contrasts with it — something that is “neither-x-nor-non-x” (e.g., MK 27.18, 27.28).

In fact, Nagarjuna’s interrelation of concepts explains it all: if we cannot establish x as real, then we cannot establish...
its absence (i.e., a not-x) or a conjunction of the two (x-and-not-x) or the denial of both (not-x-and-not-x). The third option can be established only if the first two can be (MK 5.6, 12.9), and the fourth could be established only if we could establish the third alternative (MK 25.15, 27.18, 27.28). Thus, since x is not real to begin with, the whole process fails: none of the other options are possible. In addition, Nagarjuna would add that we must reject the third option because x-and-not-x would be a composite of opposites but opposites cannot exist together in the same place (e.g., light and dark [MK 25.14]). Thus, nothing more is needed to explain the four options than general Nagarjuna’s method of interconnecting terms. Indeed, by focusing on possible logical problems with the four options, philosophers are missing how the arguments actually proceed — in short, they miss Nagarjuna’s actual reasoning entirely.

Note that in MK 18.8, the four options are not negated. Nagarjuna says: “Everything is real, and everything is unreal; everything is both real and unreal; everything is neither real nor unreal.” The third option appears to violate the law of the non-contradiction and the fourth the law of the excluded middle. One way to make this consistent (following the later Madhyamika Chandrakirti) is to invoke the “two truths” doctrine: “Every entity is real from the conventional point of view (MK 7.24), and every entity is unreal from the ultimate point of view (MK 15.4); every entity is both conventionally real and ultimately unreal; every entity is neither ultimately real nor conventionally unreal.” Entities are not real from the point of view of ultimate truth, but they do exist in the conventional sense, and so Nagarjuna is not irrational in affirming both claims — the rope/snake is indeed both real (the rope) and totally unreal (the snake) at the same time. This removes any suggestion of paradox — indeed, it makes it obviously true from the Buddhist point of view.

Certainly we should not immediate jump to the conclusion that a thinker from another culture and era is irrational simply from the form of his writings. Nor should we ascribe to him the state of the art in logical thinking from our culture and era. The question is not whether a given verse is contradictory in form, but whether Nagarjuna’s thought behind it is consistent or not. That is, can we paraphrase what Nagarjuna says consistently without doing violence to his thought? If so, then the fact that the idea can also be stated illogically is irrelevant. For example, if I am standing in a doorway between two rooms with one foot in each room, I can state this paradoxically: “I am in this room and not in this room” or “I am in two rooms at once.” (See Priest 2004: 28.) But I can also state the situation more completely without paradox: “I am partially in one room and partially in the other.” Paradox occurs only if I say “I am entirely in both rooms.” But this statement is not only paradoxical but false and no one believes that — the correct situation can be stated consistently. And the same applies to the situation with Nagarjuna’s controversial passages: we do not have to torture what he says to see that he is being logical within his framework of beliefs.

Nagarjuna’s Method

The analysis via the interconnection of concepts (e.g., “entity” and “non-entity” in the four options) is one of Nagarjuna’s primary means of argumentation. (It should also be noted that Nagarjuna’s questions did not come out of the blue. That what is conditioned is only an indicator [prajnapti] was advanced by the earlier Mahasamghikas. And the Abhidharma set many of the issues scholars usually attribute to Nagarjuna — e.g., whether something arises unarisen [see Frauwallner 1995:197-98].) A second means is to point out that there is a conflict between our everyday experience of change in the world and the alleged permanence of the svabhava metaphysics (e.g., MK 13.3-4). This is not a scientific analysis of how things work but simply an appeal to obvious, everyday experiences. A third means involves interconnection of phenomena (e.g., “cause” and “effect,” “fire” and “fuel,” or “moving” and “a mover”) or the relation between an entity and its properties (e.g., an “impassioned person” and “passion”). According to Nagarjuna, if concepts are connected then so is what they conceptualize (e.g., M K 6.1-2), and so the first and third means are not always distinguishable.

His overall method is a reductio ad absurdum: he starts with what he sees as his opponents’ tenets concerning self-existence and then shows how these premises lead to contradictions with either our experiences or the concepts involved. For example, he claims that what exists by self-existence can only be either identical to something else real or totally distinct; hence, if the oneness of two entities or their absolute difference is not possible (e.g., a cause and its effect [MK 20.19]) because we see otherwise, then the entities are empty of self-existence and not real. Thus, the initial premise — self-existence — must be wrong. Emptiness then follows automatically. That is, he does not argue for emptiness, but in a case of x or non-x he shows that the only alternative he sees — self-existence — must be rejected. Thus, he does not present positive arguments for a thesis or use emptiness as a reason but only presents problems with its alternative. In short, he does not argue for shunyata but only against svabhava. (This is not to say that his arguments are perfect — e.g., he often states a claim without arguing for it, as with MK 1. We have to find the reasons elsewhere in the texts. Or, to take another example: simply because we cannot see the beginning or the middle of something’s existence, it does not mean we cannot see the end; nor is that grounds to conclude something does not exist [contra VP 27].) In short, emptiness is a conclusion that follows from the failure of a svabhava argument, not a reason or premise (thesis) in its own right.

Argument based on the interconnection of concepts proceed in that manner. Our conceptualizing mind operates by making distinctions, and hence if an entity being referred to does not exist then neither does its opposite and so there is no real distinction to be drawn. For example, if there is no self-existent mover, then there is no mover who could rest; but since there is no mover, there can be no non-mover either who could rest (MK 2.15) since the very idea of a “non-mover” depends upon there being a real “mover.” What is
“unpleasant” depends upon what is “pleasant” for its label and vice versa; so no real entities are involved (MK 23.10-11). So too, if there is no self, there is no non-self, and so forth. In particular, if there is nothing that is not empty, then there is nothing empty to contrast it with (MK 13.7).

His argument in the abstract is simple. Whatever topic we are talking about is either real or unreal. If it is real (i.e., self-existent), then it is eternal and unchanging and cannot do anything — it cannot be a cause or effect, cannot be produced or cease, cannot move or change, cannot have conditions, and so forth. On the hand, if it is unreal, then it is not a reality that can be a cause, have a characteristic, and so forth. There is no third possibility. Thus, the field is cleared of alleged “entities,” and only emptiness remains. Reality as it truly is (tattva) has no alleged real parts and so can work precisely the way we see the phenomenal world working.

Overturing the Objections shows how hard it must have been for Nagarjuna to convince his Buddhist opponents that something could exist or work even if it was not self-existent. The opponents apparently could not accept any other criterion for what is real. To them, the lack of self-existence is the lack of existence period — if something was empty of self-existence, it was totally nonexistent and powerless to achieve anything. They saw everything in terms of self-existent entities alone being real and capable of doing anything, and they saw Nagarjuna as actually having to be committed to them too just to make any arguments.

As argued above, Nagarjuna does advocate propositions and has a metaphysics, even if these are not “views” or “theses” in his technical sense. But he did not employ them in his arguments. That is, Nagarjuna advances no propositions or counter-metaphysics to his opponents’ that he has to defend. Rather, he simply employs the reductio ad absurdum approach to show that errors follow from their metaphysical beliefs. This does not compel him to accept a counter-proposition: he need not defend any alternative if he only shows that there are flaws in another’s position. And one can point out problems in someone else’s position without defending a counter-position. For example, you could point out an error in my adding a column of numbers without advancing what you think is the correct sum. But it must be reiterated that this does not mean that Nagarjuna did not himself hold metaphysical beliefs connected to emptiness and the steps of dependent-arising — it merely means that he did not employ his conclusion of emptiness as a reason against his opponents. Also, he did not merely appeal to logic, conceptual analysis, and everyday experiences. He used the changes involved in dependent-arising as a reason to reject self-existence (W 20 Comm.); that would be uncontroversial for his Buddhist opponents who also accept dependent-arising, but in arguments against other traditions this would have to be established independently.

Is Nagarjuna Attacking a Straw Figure?

One nagging question about Nagarjuna’s method needs to be discussed. Many of his conclusions do follow logically from his premises, but some commentators argue that there is something wrong with Nagarjuna’s method (Robinson 1972, Jones 1986, Hayes 1994, Huntington 2007; contra Garfield 2008). The place to begin to see the problem is with the beliefs he ascribes to his opponents, the Abhidharma Buddhists.

The problem is that Nagarjuna is not identifying some obscure logical implication deduced from Abhidharma metaphysics that the Abhidharmists did not see. Rather, he claims to have found an immediate and blatant conflict between one of their basic premises and everyday experience or simple logical inferences. But obviously, Abhidharmists were as aware of change, decay, interaction, causation, and mirages as Nagarjuna was, and yet they still adhered to their tenets. If Abhidharma beliefs were as he claims, why would they accept them, especially when Buddhists emphasize impermanence and change? In fact, how could anyone believe what Nagarjuna claims the Abhidharmists do when it so obviously conflicts with ordinary experience? Zeno may have concluded from his paradoxes that motion is an illusion, but at least he was not telling other people what they believed. Moreover, Abhidharmists would have no explanation for the appearance of change and causation if they believed what Nagarjuna says they believe. When Leibniz and other monads argue that substances are isolated and do not interact or affect each other, they at least had a ready explanation for the appearance of interaction: God set up a pre-established harmony or coordination of events. So too, medieval Muslim “occasional-ists,” who believed that nature is not an autonomous order but a succession of individual divine decrees and that there is no “secondary” causes, saw God as the real cause and all events as individual acts of God. Nothing within the Buddhist framework would permit such a move, and, more importantly for the issue at hand, Abhidharmists saw no need for any such explanation.

It appears instead that Nagarjuna is mischaracterizing the Abhidharma concept of “svabhava.” He believes that nothing can be done with what is self-existent and the world would not change (MK 24.33, 24-38), but it is not at all obvious that Abhidharmists believe this. In particular, he seems to have introduced the idea that dharmas are self-existent and independent. To Abhidharmists, dharmas are the ultimately real constituents of the experienced world, while conventional objects are only our mental constructs. Configurations are impermanent: wholes such as persons and material objects do change, even though their momentary parts have an unchanging self-nature. The most prominent Abhidharma tradition in India and in Central and East Asia was the Sarvastivada. (Their name means “the doctrine that all exists.”) They distinguish the nature of the nuggets of experience (dhammas) that do not change through time from their impermanent activity (karitra). That is, the dhammas have an “own-nature” (svabhava) that cannot change and lasts through the past, present, and future, but they still have causal activity and changing properties and characteristics (lakshanas) in their different states (bhavas). Moreover, the
composite entities of our everyday experience lack any such own-nature and exist only as mental indicators (prajñāpāramitā). The Sarvastivadins had trouble explaining how dharma’s “own-nature” and “activity” were related — they had to say that they were both “different and not different,” as Nagarjuna says of what is conditioned. (See Cox 1995, 2004; Frauwallner 1995:197-202; Willemen 2004.)

The Sarvastivadins used their doctrine of dharmas to deal with the Buddhist problem of impermanence: how can karmic fruit arise much later after its cause expires — perhaps in another lifetime — and how can dependent-arising (along with causal effectiveness and conditioning in general) occur for events having no duration? They see a continuum (santana) without permanence. But all Abhidharmists who claimed that dharmas are eternal argued that their mode of being (dharmabhāva) did change. (And Nagarjuna does raise the legitimate point that if something is permanent and eternal then it cannot rely on causes and conditions [MK 1.6].) Even if these Buddhists did not specify what the momentary dharmas are flashes of and spoke of permanent potentialities (Potter 1999a:13-14), the actual events are still only temporary. For all Abhidharmists, “svabhava” only meant a characteristic that distinguishes one dharma from another, and this does not lead to the absurd conclusion that there is no change.

Thus, it appears that Nagarjuna’s version of Abhidharmist metaphysics is only a straw figure. Whether his own metaphysics warped his vision or whether he knew he was mischaracterizing his opponent, we cannot tell. But it is certainly a historical fact that the Abhidharma traditions in India did not simply wither away under his scathing assault, or even modify their doctrines. If his arguments were so powerful, why would that be the case?

Also consider a few examples of a basic problem with his reasoning about the interconnection of concepts: he relies on an ambiguity between conceptual or physical dependence. Again, for Nagarjuna, if concepts are interrelated, then what they refer to must be ontologically interrelated. However, this is not so. The concepts “straight” and “curved” are interconnected, but this does not mean that what is straight is in any way physically dependent upon something curved. Nor are the concepts rendered meaningless because of their interconnections; nor, as Nagarjuna realizes, are concepts rendered useless for designating impermanent things in the world.

Consider the central concept of “causation.” We call something a “cause” only once it has caused something. Therefore, the attribute “cause” is indeed dependent upon the effect. But does not mean that the thing that is the cause is in any way physically dependent upon the effect. That is, “cause” and “effect” are indeed conceptually interconnected, but what is labeled “the cause” certainly can physically exist before the conceptual rearrangement involved in the process it enters into when it become “the cause.” For Nagarjuna this is not a matter only of efficient causation but of origins, e.g., butter coming from milk. Consider the birth of John’s first child Bobby. John gains the label “father” by Bobby being born (see VV 49; SS 13). So John’s “fatherhood” is indeed dependent on Bobby’s birth. And Bobby is physically dependent on John, his wife, and other causes and conditions. However, this situation is not reciprocal: John is not in any way dependent upon Bobby physically. Only by mixing the physical and conceptual dependence together in can Nagarjuna make the cause and effect mutually dependent. In fact, a cause can materially exist both before and after the act by which the cause becomes label “the cause of x” — here, John existed before Bobby and independently of the act of conceiving Bobby, and John goes on living after the cause has produced the effect. So too, a causal act need not in some way be permanent or eternal to be a cause. However, in Nagarjuna’s version of things, “Something that is not producing an effect has no causal effectiveness. When there is no causal effectiveness, of what will the effect be?” (MK 20.22). But something can in fact have causal effectiveness even if it is not producing anything at the moment: the potential for John being a father is there even if he is not producing a child at the moment. And according to Abhidharmists, a self-existent entity can have causal effectiveness too: what is self-existent cannot change its nature, but it can act and change in that way. There are no mysteries here except those Nagarjuna artificially creates.

Any “actor” and “action” situation can be analyzed the same way. One needs to move to gain the label “mover,” but “the one who moves” existed prior to that event and will continue to exist after that event ceases. That is, there can be more to a mover than simply the attribute “the one who moves.” The labels “mover” and “the one who moves” have the same referent, but they do not have the same meaning, and Nagarjuna cannot proceed as if they did. But his arguments collapse if “mover” is defined as other than “one who is currently in the process of moving.” Only under his restrictive definition is the claim “the one who was moving is now not moving” (MK 2.16) not absurd.

More generally, despite Nagarjuna’s arguments against a “prior entity” (MK 9), something can exist before gaining the attribute that comes from a change. The person with passions exists prior to becoming impassioned — the person may be called “impassioned” only once passion arises, but this does not change the fact that the person already existed. So too with the wood that becomes label “fuel” (MK 10): the concepts of “fire” and “fuel” are indeed interlocked: the idea of “fuel” depends on the idea of “fire” (contra MK 10.12c), and the idea of “fire” depends on the idea of something that is burnable, i.e., “fuel” (contra MK 10.12b). But Nagarjuna cannot conclude from this connection that is fuel itself is dependent upon fire: fire is physically dependent some fuel (contra MK 10.12a), but fuel is not physically dependent upon a fire for its existence (contra MK 10.12d) — only gaining the conceptual label “fuel” for the material is. That is, the material that becomes labeled “fuel” physically exists independently of fire and being burned. The logs sitting by my fireplace are “fuel” prior to being lit or put into a fire; indeed, even if they are never burned, they still have the attribute of being “fuel.” And,
physically, they remain just wood, regardless of whether they ever gained the attribute of “fuel” or not — they would be what they are even if fire never existed. Only by the sleight of hand of mixing both the conceptual and physical senses of “dependence” can Nagarjuna make MK 10.12 true.

Other types of interdependence are involved in other situations and the result is the same. For example, death is not part of birth, but this does not mean that someone being born is deathless (MK 11.3). A “person who is young” does grow old (MK 13.5; R 67) — granted, the attribute “young man” is lost, but the person who had the attribute does grow old. The composite being — the “person” — does not self-exist and so can change his or her attributes, even if his or her parts exist by svabhava. But in all these cases.

the way Nagarjuna sets the problems means that those who accept self-existence see the world as sliced up into distinct unchanging objects distinct from their attributes, and so any change is not possible. This way of looking at things also means that we would somehow have to look at any actions an actor undertakes as being self-existent and therefore eternal — the action occurs permanently (MK 17.22, SS 35). Nagarjuna discusses it in the context of suffering never ending and thus nirvana being unachievable (SS 43), but it would apply more broadly: any action or event would somehow be eternally occurring and its effect would never accrue — you hit a home run and the ball never comes down and you never finish the swing. A perception of a mirage would be irremovable (VV 67) — this patently absurd, and how could anyone actually believe it?

Indeed, verse 27 of the Seventy Verses on Emptiness makes establishing emptiness absurdly easy: “A defining characteristic (lakshana) cannot exist without what it characterizes, and what is characterized cannot exist without the characteristic. Thus, they are both conditioned, and neither is real (i.e., self-existent).” Everything must have some characteristics (whether self-existent or not), but this means to Nagarjuna that by definition it cannot be self-existent. So too, every attribute gained simply by any comparison to something else or fitting in some category — “one” or “many” (e.g., SS 7), “long” or “short” (e.g., R 48-49, 95) — means to Nagarjuna that everything is dependent and hence nothing is self-existent but empty. Merely being “other” is enough to make something dependent and devoid of self-existence (MK 14.5-7). However, proving that something is not self-existent cannot come simply by declaring a characteristic to be a separate entity from what embodies it and hence dependency must be involved. We may agree with his general conclusion that there is nothing permanent in the phenomenal world and that “loose and separate” concepts cannot mirror a world free of discrete parts, but we can still see some of his arguments as sophistry.

Overall, there is an undeniable artificiality to Nagarjuna’s arguments: by taking his opponents’ terms and giving them new definitions, he fabricates a world that obviously conflicts with our everyday experience and thus is a world no one would accept. In light of this, it is not surprising that the Abhidharma schools survived in India for hundreds of years after Nagarjuna, no matter how impressed the Madhyamikas were with his line of reasoning. The Madhyamaka tradition apparently remained relatively small in India. Indeed, the epistemology tradition established by the Buddhist logicians Dignaga and Dharmakirti after Nagarjuna had more influence within Indian Buddhism and did not even respond to him. Nagarjuna’s thought, however, became very influential in Tibetan and Chinese Buddhism.

Twelve Key Sanskrit Terms for Understanding Nagarjuna
Svabhava — self-existence

For Nagarjuna, svabhava is whatever would give something the power to exist and have the properties or capacities it has. Translators render it variously as “self-existing,” “self-creating,” “self-generating,” “own-being,” “own-becoming,” “own-source,” “own-cause,” “own-nature,” “inherent nature,” “essential nature,” “essence,” or “inherent being.” Something “existing by its own intrinsic nature” is in no way produced by causes and conditions (MK 24.16, W 22 Comm.) or derived from something else that is real (MK 15.1-2); thus, it is permanent (W 55). A self-existent entity is a being “in se et per se,” absolutely independent, and existing in its own right (Tola & Dragonetti 1998:159). In Tibetan Buddhism, it is characterized as what “exists from its own side.” It is the source of its own “essence” and is self-maintaining. Such a power would also make each entity exist distinct from all other entities — no self-existent thing could be in any way dependent upon any other thing, and thus it would be self-contained.

Self-existence is necessary for anything of any type (bhava) to be real. What exists by svabhava has being (sot) and cannot be created (MK 24.33) or come to be (MK 24.23) or cease to exist or be eliminated (MK 22.24, VV 67) or otherwise be affected by any action (MK 24.33). What is self-existent cannot change (MK 15.8). Thus, any entity existing by its own nature would be eternal. All things that exist through self-existence would be permanent (eternal) because they would have no cause and what is without a cause is permanent (W 55). Something that does not exist by self-existence cannot be a cause (SS 12). The only possible relationships between things existing by self-existence are total identity and complete disconnection (e.g., MK 2.21, 6.5,18.10; W 21).

“Other-existence (para-bhava)” is simply the self-existence of something else. Thus, if there is no self-existence, there can be no “other-existence” (MK 1.3, 15.3, 22.9). This is different from otherwise-existence (anyatha-bhava), which would be a change in an existent with svabhava, which is impossible (MK 13.6).

Aristotle’s concept of “substance” as an essence is the closest in Western philosophy to Nagarjuna’s idea. Substance is what remains when all experienced, changing properties are removed. (That modern empiricists question the very notion
of “substance” — in John Locke’s phrase, a “something we know not what” — should be noted.) But “svabhava” denotes both self-existence and some inherent property — it is not a featureless reality distinct from the properties or attributes that sustains those properties. Nor should it be confused for matter. Buddhists have another concept for matter (rupa). In modern philosophy, the closest is Leibniz’s idea of simple “monads,” each being the source of its own powers and properties (but not its own being) and all existing in a harmoniously working, coordinated universe (although Nagarjuna does not have this latter component).

Nor do different entities necessarily share any other characteristics simply because they exist by “self-existence” — the “own-nature” of each thing distinguishes it from anything that does not possess its particular properties. Thus, some translators prefer the idea of “inherent nature” rather than the idea of “self-existence.” Nagarjuna uses the word in both the sense of “substance” and “own-nature.” (“Svabhava” can also mean simply “by its own nature” in a non-philosophical sense, just as Nagarjuna can use “atman” [MK 10.15, 22.16, 27.4] without a commitment to a metaphysics of an eternal, unchanging soul.) Nor does the “substance” he intends involve mass or solidity. In short, svabhava is a metaphysical power that gives a thing is both its existence and its characteristics.

Asthī / Nastī — “It is” / “It is not”

“It is” or “There is . . . (asti)” and “It is not” or “There is not . . . (na-asti)” also become technical terms for Nagarjuna since only what exists through svabhava is real and only something real can be destroyed and not exist (MK 5.8, 11.12, 15.7-8, 15.10-11, 23.3, 25.14). “Is” and “is not” are not opposites, as in eternalism versus total non-being (asat). That is, astī and na-asti do not simply contrast what exists permanently real because of svabhava (sat) and total nonexistence (asat). Rather, for Nagarjuna, “is not” is a change in “is” — the destruction of something that was an “is.” Thus, “It is not” depends on there first being an “It is” (R 72).

Something that never existed, e.g., Santa Claus or the horns of a rabbit, cannot be said to “not exist” since they never existed in the first place. To Chandrakirti, the idea of “a son of a barren woman” is “mere words,” and denying that such sons exist is not a real negation but merely the denial of the possibility of imagining them as real. To say that “There is nirvana, but it lacks self-existence” or “It is real, but it does not exist by self-existence” would simply be a meaningless contradiction in terms for Nagarjuna.

What is empty of svabhava neither “is” nor is absolutely unreal, like the horns of a rabbit. This means that reality as it truly is (tattva) neither “is” nor is any change resulting in “is not.” Saying that what exists through emptiness neither “is” nor “is not” is not a paradox but is Nagarjuna’s way of saying that the thing neither has self-existence nor is the destruction of something with self-existence — it is a denial of the eternalism of “it is” and the annihilationism of “it is not.” Thus, dependent-arising is a “middle way” between “is” and “is not.” So too, those whose awareness has gone beyond “it is” and “it is not” do not grasp any entities (bhavas) (YS 1).

Bhava — an entity

A bhava is any “thing.” To be real, it must have self-existence (MK 13.3). It is then an “existent” (MK 15.4). It can be any kind of self-existent being, capacity, attribute, or object in the widest possible sense — it is anything in the phenomenal world that we think can be an object. (This is not the same as dharmas, as discussed below.) But a bhava can be real (sat, sadbhutam) only if it exists through self-existence. Without self-existence, it is not real and does not exist (MK 1.10, 13.3) except conventionally.

Since to be real a bhava must exist through self-existence, and since there is in fact no self-existence, there are no real bhavas. From the ultimate point of view, conventional bhavas are impermanent in nature (YS 25). Thus, Nagarjuna is not denying entities altogether but arguing that the idea that they really are self-existent arises only from the root-ignorance (avidya) (YS 26). He is disputing their nature, not their existence in the ordinary sense.

Abhava — the absence of a bhava

An abhava is the denial of an existing bhava, i.e., the absence of a bhava. Under the self-existence metaphysics Nagarjuna ascribes to his opponent, an abhava is a type of thing — an absent entity. If there are no bhavas, no abhavas can be found (e.g., MK 25.7). Thus, it can exist only if it had been a bhava first (MK 15.5). And since real bhavas exist by svabhava (MK 15.4), an abhava is not something that does not exist (asat). That is, abhava are not nonexistent in the sense of the nonexistence of a married bachelor or Santa Claus. Only what allegedly exists by self-existence and cannot currently be directly apprehended can be an abhava. But the existence of an abhava can be inferred. (See Tsering 2008: 56-57.) However, if self-existence is impossible, a real bhava is not possible, and hence a real abhava is also not possible.

Thus, according to Nagarjuna, under a self-existence metaphysics an abhava is some thing that is real (i.e., self-existent) and is only absent from the place under discussion. It is still a type of reality and not nonexistent. The usual translation — “non-entity” — does not capture this.

Dharmas — basic phenomena of the experienced world

These are the “factors of the experienced world” according to the Buddhist analysis of reality. They are not eternal in nature but last only momentarily. They are not the same as bhavas: bhavas are conventional entities; dharmas are the ultimate components of what we experience. Buddhists analyze the phenomenal world, like Westerners, assuming that the ultimate parts are real in a way that the composite entities we see in the everyday world are not. But while Westerners have looked for the ultimate units of objective matter, the Buddhists have looked for the ultimate units remaining within the realm of what is experienced — hence, matter (rupa, consisting of earth, water, fire, and air) becomes
only a minor category in the Abhidharmists’ catalogs of components. The Sarvastivadins had an elaborate taxonomy of seventy-five dharmas of which matter was only one (see Willemen 2004: 220-23).

It should be noted that the Abhidharma analyses of dharmas were done for a soteriological purpose (Cox 2004: 5) — to explain how the Buddhist praxis could work — and so it was philosophy for a religious end. And Nagarjuna does not dispute the dharma approach, nor was he interested in the particular delineations: the big divide between Nagarjuna and his Abhidharmist opponents is ontological, not epistemic — i.e., over whether these ultimate components of the experienced world are self-existent or empty.

Drishti — view

This term comes from a root meaning “to see” — it is a way of seeing the world. A drishti is a “point of view,” but it is not merely an experiential perspective: it also a way of understanding what is seen — a metaphysical view. But to Nagarjuna, it is not any metaphysical or speculative view: only views based on the metaphysics of self-existence qualify as a “drishti.” Nagarjuna always connects drishtis to svabhava (MK 13.3,13.8, 15.10, 21.14, 24.21, 27.1-2, 27.13-14, 27.29-30; R 43-46; YS 23; YS 43-54) or the reality connected to svabhava (sat) (SS 21). Thus, anyone who treats emptiness as a drishti is incurable (MK 13.8) — i.e., to treat emptiness as a view would make it the very poison that the concept is advanced to cure.

Prapancha — conceptual projection

Prapancha is projecting onto what is truly real (tattva) the conceptual differentiations we ourselves devise, and thereby seeing reality in terms of discrete entities. Translators have rendered the term “objectification,” “projection of plurality,” “conceptual construction,” “hypostatization,” “reification,” and “superimposition.” It makes our subjective mental discriminations into an “objective” reality. In this way, we create a false world of differentiated, isolated objects corresponding to our conceptual creations. The nature of the conventional world is born from prapancha (R 50).

In effect, we see objects in the real world mirroring our concepts. In other words, it is seeing our concepts as instantiated in the real world. Thereby, we create the conventional world. But concepts of independent entities never converge with reality as it really is. (This includes even the distinction between experiencer and what is experienced.) The very discrimination of distinct entities (vikalpa) is the result of projecting our conceptual distinctions onto reality (MK 18.5). We thereby distort reality by seeing it as a collection of unconnected entities corresponding to the discrete concepts our mind has devised. Such discriminations cause karmic acts and the resulting afflictions (MK 18.5).

To be enlightened is to “still” the mind and to be free of this projection, not to be free of perceptions and concepts per se. Thus, the enlightened need not do away with concepts — they can still use whatever concepts their culture uses to navigate in the world and to teach, but they do not project the categories they are using onto the world (MK 22.15). Thereby, the enlightened preserve both the language of conventional life and seeing reality as it really is (tattva).

Shunya — empty, void

Something that is shunya is empty of something — svabhava. It does not concern being empty of matter — it is a metaphysical emptiness of anything that gives something the power to be, not a space empty of all material things. Nothing is self-created or self-contained. In effect, it is a metaphysical expansion of the Buddhist idea of no-self (anatman) more broadly to all things. (Hence, Nagarjuna discusses the emptiness of a person or a self [MK 18] just like any other phenomenon.) The idea has roots in the Pali canon (see Velez 2005: 508-13.) There is no eternal, permanent “self” to a person or anything corresponding to a “self” in other things that would give anything self-existence. But “emptiness” is not merely a negative conclusion — Nagarjuna does give substantive characterizations of how reality truly is (see tattva), and he equates emptiness with the Buddhist metaphysics of dependent-arising (MK 24.18).

The noun “shunyata” is the abstraction “emptiness,” but this does not make emptiness into a metaphysical source or any other type of reality. That is, emptiness is not an “essence” by which things exist or a “mode of existence” in place of self-existence. It is not a new special power. The term merely describes the true state of things — everything is empty of any power to make anything self-existent. What is conditioned is not one or many, or being (sat) or nonbeing (asat) (SS 32). From the point of view of reality, there is no being (sat) or nonbeing (SS 1). Thus, the true state of things is that everything is essenceless — contingent, impermanent, changing, and dependent upon other things. Entities have the status of dreams or magical illusions — i.e., dependent on other things, arising from other things, and without any self-existent substance. (Also see the discussions of the “emptiness of emptiness” in the Commentary on MK 22.11 and 24.18.)

Nagarjuna used the adjective “shunya” more than the noun “shunyata” in the Karikas, and perhaps it is better to avoid the abstract noun, since anyone who reifies emptiness and makes it into a cosmic Void or a new “essence” giving things their reality or any type of reality similar in any way to svabhava is simply incurable (asadhyan) (MK 13.8) — they are hopelessly seeing the world in terms of self-existent entities.

Tattva — reality as it truly is

“Tattva” is literally the “that-ness (tat-tva)” of things (MK 15.6, 22.8, 24.9). “Yatha-bhutam” (R 28) and “dhammata” (MK 18.7) convey the idea of the true nature of things. Tattva is not a transcendental reality, but the phenomenal world as it really is — empty of any svabhava. Thus, is-ness [asti-ta] is not a synonym, and we must pass beyond “is-ness” and “is-not-ness” (R 61) to see what is truly real. "The characteristic of what is actually real is this: not dependent upon another, peaceful, free of being projected upon by conceptual
projections, free of thoughts that make distinctions, and without multiplicity. Whatever arises dependently upon another thing is not that thing, nor is it different from that thing. Therefore, it is neither annihilated nor eternal. Not one, not diverse, not annihilated, not eternal (MK 18.9-11).”

Tattva is free of any discrete parts that we normally cut the world up into — it does not have the sharp, artificial borders that our conceptual differentiations suggest. Nagarjuna is a realist in the sense of affiriming a reality independent of our individual minds, although reality is not cut up into the entities we conceptualize, while his opponents are realists with regard to discrete entities (dharmas or bhavas).

Tattva could be called “empirical reality,” although Nagarjuna would reject dividing it up into illusory discrete objects. (Thus, Nagarjuna would reject any correspondence theory of truth for claims from the ultimate point of view.) Nor does Nagarjuna reject “empirical experience” (i.e., sense-experience of the phenomenal world) as insightful — he simply wants to correct our experience to see what is really there.

Those who see reality (tattva-darshana) do not form the dispositions that propel the cycling of rebirth (MK 26.10), and they thus do not perform actions that continue the cycling of rebirth — i.e., they are liberated.

Satya (also saddbhutam) — truth/reality

Classical Indians did not differentiate “truth” and “reality” — whatever has the power to bring about effects or to be affected is true/real. Nagarjuna says the Abhidharmists are committed by the concept of “svabhava” to the position that what is real or has being (sat) is permanent, unchanging, and unconnected to other real things. But, according to Nagarjuna, nothing in the phenomenal world in fact has “being (sat)” (SS 1-4).

Paramartha-satya — ultimate truth

“Truths from the highest point of view” are the means of gaining the highest fruit (parama-artha), i.e., liberation from the cycling of rebirth and full enlightenment. They are truths from the point of view that gives the ultimate ontological status of things — i.e., no further analysis would correct these truths. Thus, ultimate truths are truths about the phenomena of the world from the point of view of how things really are free of our concepts (tattvas).

But expressing ultimate truths depends on our conventions (MK 24.10): they are truths that can be stated with our concepts about how things really are — in particular, “All this is empty.” And without reaching the truth from the highest point of view, nirvana cannot be achieved (MK 24.10). Thus, realizing that an ultimate truth is in fact true of reality as it really is requires an experience, but this does not change the fact that the truth is statable. (And words still have a fixed meaning even if they arise conventionally as our inventions and are free of self-existence.)

The ultimate truth is “beyond words” only in the sense that the Buddha was a “silent one (muni)” who did not teach anything real (self-existent) (MK 25.17) despite being a teacher who spoke and taught a specific doctrine. However, the enlightened can appeal to conventional language to teach the way to liberation. That is, without relying upon worldly conventions, the truth from the highest point of view cannot be taught (MK 24.10). Thus, the Buddha could use “1” and first-person verbs without being committed to a metaphysics with a self-existent self.

Samvyavahara (vyavahara-satya, loka-samvriti) — conventional truth

Conventional truths are truths about what we take to be conventionally real — i.e., truths about the content of the phenomenal world in terms of discrete entities. They are part of the more encompassing “conventional practices” of the world.

One meaning of “samvriti” involves “concealing,” “hiding,” or “obscuring.” So Tibetan Buddhists see “conventional truths” as “concealer truths” cloaking the way reality truly is and obstructing ultimate truth. Thus, conventional truths are true but are “deceptive truths.” (See Tsering 2008: 105-109.) However, they are only “deceptive” in not giving the ultimate ontological analysis of the subject of the truth — they still reveal something true about the content of the phenomenal world. To Nagarjuna, conventional truths are still true, but they reflect our unenlightened way of looking at the world — what is “real” in the everyday sense (i.e., distinct entities), not the way reality really is (tattva).

That is, we are still seeing reality through a conceptual prism not involving emptiness: we cut up reality according to our concepts, and we accept as real depends on our conventions.

PREFACE

Almost ten years ago, I undertook a new translation of Candrakirti's* encyclopaedic work the Prasannapada*, a commentary on Nagarjuna's* primary philosophical treatise, the Mulamadhyamakakarika*. After I had completed neatly ten chapters, I learned through one of my students about a similar attempt by Professor Marvin Sprung. I was about to give up my project, when my student, who had previously studied under Professor Sprung, shared with me a copy of Professor Sprung's translation of the last chapter. Comparing his and my translations, I discovered that Professor Sprung's translation was to some extent influenced by Stcherbatsky's work (The Conception of Buddhist Nirvana,
1927). I felt then that my effort would not be in vain, especially because I had expressed strong disagreement with Stcherbatsky's interpretation of the Buddhist philosophical tradition (see my Causality, The Central Philosophy of Buddhism, 1975).

To my surprise, Professor Sprung's translation, consisting of only seventeen chapters (including an incomplete rendering of Chapter I), appeared in 1979. As I plodded along through my own laborious work, I began to realize how Candrakirti* was gradually leading me away from Nagarjuna's philosophical standpoint. My suspicions were strengthened in 1981 when I visited India on a Smithsonian grant. Meeting with some scholars who were brought up in the Vedantic tradition, I found them to be extremely comfortable with Nagarjuna* as interpreted by Candrakirti* and less impressed--by the teachings of early Buddhism as recorded in the Nikayas* and the Agamas*. My suspicion that Nagarjuna* and Candrakirti* were upholding two different philosophical standpoints compelled me to take a fresh look at Kumarajiva's* Chüng-lun, which is at least two centuries prior to Candrakirti*. Translating the entire Chüng-lun into English and comparing it with Nagarjuna's* original Sanskrit text, I was pleasantly surprised by their similarities. I found no justification whatsoever in looking at Nagarjuna* through Candrakirti’s* eyes when there was a more faithful and closer disciple of Nagarjuna* in Kumarajiva*. This discovery diminished my enthusiasm for cleaning up my English rendering of the Prasannapada* for possible publication.

After translating both the Sanskrit and the Chinese versions of Nagarjuna's* treatise, I proceeded to annotate both according to my understanding of early Buddhism as well as later Buddhist traditions before Nagarjuna*. The annotation of the Sanskrit text alone turned out to be more extensive than anticipated. Furthermore, considering the difficulties that might arise in publishing this work with Sanskrit and Chinese texts side by side, and also with the Chinese characters in the body of the annotation, I decided once again to modify my project. The Sanskrit text is here presented with annotation and introduction. The Chinese text with commentary will appear subsequently as a companion volume.

I am not unaware of the controversy this work may engender. Hoping that it will be a healthy one, I intend to raise one major question regarding Nagarjuna*, especially in the light of the more recent research in the history of Buddhism. Professor Hajime Nakamura's monumental work, Indian Buddhism (1980), has provided more information regarding the history of Buddhist literature than any other work published so far. This carefully executed work not only deals with the contents and authorship as well as the chronology of most of the Buddhist texts, but also compares the different versions available in Sanskrit, Pali, Chinese, Tibetan, and Japanese. After a careful reading of this work, I cannot help recognizing an earlier stratum of literature that has so far been lumped together with all the literature that came to be called Mahayanistic*. This includes two famous pieces, the Kasyapaparivarta* and the Vajracchedikā-prajñaparamita* (see Nakamura, p. 159). I wonder whether the original versions of these texts can be appropriately called Mahayanistic*, even though they were preserved by the Mahayana* schools. This objection, indeed, is not very difficult from that raised against considering the Nikayas* and Agamas* to be Hinayanistic* because they were preserved by the Theravadins*, the Sarvastivadins*, or any other later tradition.

The major question that can be raised is: "Where would a philosopher like Nagarjuna* go in order to discover the Buddha's teachings?" This historical question has, to my knowledge, neither been raised nor answered. The Saddharmapundarika-sutra* that highlights the Hinayana-Mahayana* controversy was not yet written. That does not mean that the controversy was not known before Nagarjuna*. Even if the controversy had preceded Nagarjuna*, what were the canonical texts, embodying the pure Mahayana* philosophical standpoint, that Nagarjuna* could have utilized in order to explain the Buddha's message?

A careful reading of Nakamura's work shows it to be futile to attempt to discover a pure Mahayana* text that Nagarjuna* might have been able to depend upon. Before the compilation of the Saddharmapundarika*, one can hardly expect to find a carefully executed treatise that would explicate the Mahayana* philosophy as it is presented by modern scholars. Since such sophisticated Mahayana* sutras were not available to Nagarjuna*, he could not help moving on to the early discourses in the Nikayas* and the Agamas* in search of the Bud- dha's teachings, especially at a time when he realized that the problems were created not only by metaphysicians like the Sarvastivadins* and the Sautrantikas*, but also by more popular religious teachers like Asvaghosa*, who over-emphasised the function of "faith" in the emerging belief in a transcendent Buddha. A careful reading of Nagarjuna's* treatise will reveal that he was critical of both these trends. If Buddhaghosa were to be considered the model of a Theravadin* and Candrakirti* or Santideva* were to be looked upon as ideal Mahayanists*, neither the Buddha, nor Moggaliputta-tissa*, nor Nagarjuna* would fit into their shoes.
The present work may come as a surprise to many who are familiar with my previous publications, especially because it repudiates many things that I have said about Nagarjuna*. In those earlier works, my major endeavor was to show how the Buddhism of the Buddha differed from both Sthaviravada* and Mahayana*, and the latter included philosophers like Nagarjuna*. My main contention with scholars like Stcherbatsky and Mufti has been in regard to the manner in which the former equated Sarvastivada* with early Buddhism and the latter portrayed the Buddha as a half-hearted metaphysician introducing a theory of elements that came to be rejected by Nagarjuna*. I was prepared to accept Murti’s interpretation of Nagarjuna*, while struggling to find ways in which that interpretation could be justified without sacrificing the empiricism of the Buddha. A more detailed study of both Magarjuna* and Candrakirti* has convinced me that the former still remains faithful to the Buddha, while the latter has moved more towards a Vedantic* interpretation, thereby initiating a process that culminated in the disappearance of Buddhism as a distinct ideology from the Indian scene a few centuries later.

INTRODUCTION

The Middle Path

Myths of huge proportions have developed around the spiritual and philosophical stature of various personalities in almost every school of Buddhism. Often these myths were inflated by sectarian rivalries that continued to plague the history of Buddhism, especially the rivalry between the two major schools, Theravada* and Mahayana*. These prejudices tended to polarize the philosophical teachings of these two traditions though, in fact, they are similar if not identical. They are similar in being faithful to the basic teachings of the Buddha; they are also comparable in the way in which they rejected certain metaphysical ideas that continued to creep into the teachings.

The two aspects of the Buddha’s teachings, the philosophical and the practical, which are mutually dependent, are clearly enunciated in two discourses, the Kaccayanagutta-sutta* and the Dhammacakkappavattana-sutta,2 both of which are held in high esteem by almost all the schools of Buddhism in spite of their sectarian rivalries. The Kaccayanagutta-sutta*, quoted by almost all the major schools of Buddhism, deals with the philosophical “middle path”, placed against the backdrop of two absolutistic theories in Indian philosophy, namely, permanent existence (atthita*) propounded in the early Upanisads* and nihilistic non-existence (natthita*) suggested by the Materialists. The middle position is explained as “dependent arising” (paticcasaṃuppada*) which, when utilized to explain the nature of the human personality and the world of experience, appears in a formula consisting of twelve factors (dvadasaṅga*). The practical middle path is enunciated in the equally famous Dhammacakkappavattana-sutta, respected by most Buddhists as the first sermon delivered by the Buddha. Here the middle path is between the two extremes of self-indulgence (kamasukhalikānuyogā*) and self-mortification (attakilamathānayo∗) and consists of the noble eightfold path (ariyā atthangiko* maggo) leading to freedom and happiness.

Throughout the history of Buddhism, Buddhists have endeavored to remain faithful to the doctrines enunciated in these two discourses, in spite of unfortunate divisions into Theravada* and Mahayana* and in the face of enormous pressures, either from inside or from outside, either social or political, that forced them occasionally to deviated from the original message. For example, in the sphere of philosophical speculations, one of the sects belonging to the so-called Sthaviravada*, namely, Sarvastivada*, presented a theory of “self-nature” or “substance” (svabhava*) and some of the Mahayananists* admitted a conception of “inherent thought of enlightenment” (bodhi-citta), both of which, as may be indicated in the following discussions, are theories contrary to the fundamental philosophical tenet of the Buddha, namely, “dependent arising” (paticcasamuppada*).

The practical middle path as enunciated in the famous Dhammacakkappavattanasa-sutta, which is complementary to or based upon the philosophical middle path referred to above, was more susceptible to variations. The analysis of the wide variety of religious practices that emerged in the two traditions, Theravada* and Mahayana*, which appear to be contrary to the middle path enunciated in the above discourse may require a separate volume. The present treatment will therefore be confined to the philosophical middle path and its survival, in spite of the heretical interpretations that occasionally appeared in the Buddhist tradition. The survival of that middle position in philosophy can be attributed to reformers like Moggaliputta-tissa (little known among the Western scholars of Buddhism, in spite of the important role he played in the Buddhist council held during the reign of the Emperor Asoka of India) and Nagarjuna*. Such personalities have emerged from time to time and they have been responsible for the continuation of the Buddha’s message. The activities of such reformers have either been ignored, as in the case of Moggaliputta-tissa, or exaggerated, as in the case of Nagarjuna*.

The present essay is not intended as an attempt to highlight the contributions of the less known figures like Moggaliputta-tissa*, whose famous treatise, “The Points of
Controversy" (*Kathavatthu*), 3 awaits a careful and sympathetic treatment by Buddhologists. On the contrary, this will be an attempt to put into perspective the philosophical and spiritual stature of Nagarjuna*, which has been exaggerated beyond limits, more by modern scholars than by the classical Buddhists.

Nagarjuna*: The Myth

Nagarjuna* has been considered the second Buddha and has occupied a second position in the line of patriarchs in almost all schools of Mahayana* Buddhism, primarily because the adherents of these schools refused to recognize the spiritual status of thousands of Buddha's immediate disciples who, according to the Buddha's own recognition, had attained the same knowledge and understanding (nana-dassana*) as well as the moral and spiritual perfection attained by the Buddha. While the intellectual and spiritual attainments of the immediate disciples are clearly portrayed in texts like the Theragatha* and the Therigatha*, no such information is available to us about Nagarjuna's* spiritual attainments except the account of his conversion to Buddhism and his scholastic activities referred to in a biographical account translated into Chinese by Kumarajiva *.4 Nagarjuna's* stature as the second Buddha derives, therefore, from his basic writings, which are generally looked upon as philosophical interpretations of the Mahayana* sutras.

Kenneth Inada, who presented one of the most sympathetic analyses of Nagarjuna's* thought, has admitted that the veneration of Nagarjuna* "at times reached such ridiculous heights that his name was sanctified and stamped everywhere with reckless abandon even for purposes of frauding scriptural authority."5 He was probably referring to the attempt on the part of some of the later Tantric writers to seek authority and sanctity for their ideas, which were undoubtedly influenced by some later Indian religious practices. Even if one were to ignore such excesses, it is possible to maintain that the exalted position accorded to Nagarjuna* yet reflects an uncritical and dogmatic attitude of some of the later Buddhists toward the spiritual ideal of early Buddhism. Such an attitude is reflected not only in some of the Mahayana* texts but also in some of the Theravada* commentaries. For example, in the later Theravada* commentarial literature, an exalted status is accorded to the Abhidhamma in relation to the discourses, so much so that the Buddha had to ascend to the world of deities (*devaloka*) and preach the Abhidhamma to his "mother" who was residing there.6 Such an admission, though intended to provide authority and sanctity to a body of literature that emerged long after the passing away of the Buddha, undoubtedly carried the implication that the Buddha's immediate disciples were not capable of understanding its contents. However, even though such an implication was there, the Theravadin* did not elaborate this story in such a way that it would lead to the devaluation of the early ideal of an arahant. Yet, when a similar need was felt by the Mahayanist* to provide authority and sanctity to some of the later Mahayana* texts such as the *Prajnaparamita* sutras*, which were obviously later than the Abhidharma treatises, they were not satisfied with merely saying that they were "great discourses" (*vaipulya-sutra*), greater than those included in the Nikayas* and the Agamas*. They, in fact, proceeded to condemn the very ideal of an arahant embodied in those discourses and to criticize the spiritual attainments of the early disciples of the Buddha.

In this particular movement, the *Saddharmapundarika*-sutra* leads the field.7 The motivation or even the final goal of this movement may have been very noble. It was, in fact, one of the earliest attempts to unify all the conflicting ideas and ideals that were creating enormous rifts among the Buddhist community. Yet, the manner in which such unification was carried out led to increasing conflicts rather than to their reconciliation or appeasement.

Even a superficial glance at the history of Buddhism would reveal the existence of "monks" (*bhiksu*) who deviated from the ideal and who falsely claimed spiritual attainments while leading a form of life inferior to that of ordinary lay people. Such monks were reported even from the time of the Buddha. The *Vinaya-pitaka* *8* as well as the *Kasyapararivarta*9 generate no sympathy for such miscreant monks, the latter branding them as a pack of dogs fighting each other for a morsel of food thrown at them.

Such selfish and dishonorable behavior on the part of certain monks may have been counter productive. Self-sacrifice and absolute altruism could emerge as noble ideals in such a context. However, such actions and reactions need not be a reason for condemning even the immediate disciples of the Buddha, arahants like Sariputta*, Mogallana*, and Cassapa, as people of "low aspirations" (*hinabhirata*),10 and forcing them to disclaim their attainments in order to accept a new ideal, an ideal certainly contrary to the "middle path" enunciated by the Buddha in his very first discourse to the world. It is by following a "middle path" avoiding the two extremes of self-indulgence and self-destruction that the disciples of the Buddha attained the state of freedom called "the appeasement of dispositions" (*sankhara-samatha*) and continued to work for the welfare and happiness of mankind. Very authentic records available in the Ther- and Theri-gathas* bear ample testimony to the ideal of the
early disciples, and it is also an ideal recognized by Nagarjuna*, the champion of the "middle way" (XVII.1). While the Theravadins* elevated the Abhidhamma to an exalted position without devaluing the ideas embodied in the early discourses, the Saddharmapundarika* appears to have gone much further in dealing with this entire Buddhist philosophical and religious tradition beginning with the Buddha himself. It is responsible not only for condemning the early discourses, but also for down-playing the value of the early discourses. The discourses included in the Nikayas* and the Agamas* were considered to be inferior in content. The argument presented is that because the immediate disciples could not understand the deeper doctrine the Buddha had to preach an inferior and unsatisfactory doctrine to suit their intellectual capacity. Such a statement, however, has a hidden implication, namely, that the Buddha lacked the capacity to teach the deeper doctrines in a way that would be intelligible to the people who were in his presence. In the Mahayana* tradition, the stage was thus made ready for a philosopher like Nagarjuna*, who is supposed to have best expounded the doctrine, to be elevated to the level of a second Buddha, nay, even to the status of a supreme Buddha more exalted than Sakyamuni*. Thus, it is not surprising to find some modern commentators proclaiming the view that the lotus bud that appeared in the world with the birth of the Buddha grew up and blossomed forth with the appearance of Nagarjuna*. In fact, a scholar like T. R. V. Mufti has maintained that the Buddha even suggested a "theory of elements" (dharma), which came to be be rejected by Nagarjuna* when the latter presented his theory of "emptiness" (sunyata *). This undoubtedly places Nagarjuna* in a more exalted position than that occupied by the Buddha. Most classical and some modern scholars have thus created an atmosphere where the interpretation of Nagarjuna*’s philosophy will have to assume a historical development and unfolding of doctrines that were merely suggested, not taught, by the historical Buddha. Some writers on Buddhism, intoxicated by this conception of the evolution of thought, have shown reluctance to recognize the sophistication with which philosophical ideas were presented by the Buddha 2500 years ago. Having miserably failed to perceive the philosophical ingenuity of the Buddha as reflected in the Nikayas* and the Agamas*, as well as the subsequent degeneration of that system in the later commentarial tradition, followed by a revival of the earlier system by philosophers like Moggaliputta-tissa and Nagarjuna*, these writers are insisting upon a gradual sophistication in Buddhist thought comparable to what one can find in the Western philosophical tradition.12

Nagarjuna*: The Philosopher and Grand Commentator

In the following pages, an attempt will be made to present Nagarjuna* merely as a grand commentator on the Buddha-word and to show that he did not try to improve upon the teachings of the Buddha. His work will be explained as an attempt to destroy the weeds that had grown around the Buddha's teachings as a result of some of the ideas expressed by philosophers of both the Staviravada* and the Mahayana* traditions. It will be shown that the Mula-madhyamakakarika* (hereafter abbreviated as Karika*) is a superb commentary on the Buddha’s own kaccayanagotta-sutta*, a commentary in which Nagarjuna* upholds every statement made by the Buddha in that discourse, bringing together more material from the other discourses as well, and then clearing the water muddled by the speculations of some of the metaphysicians of the later Buddhist tradition. The continuation of certain sectarian prejudices among the faithful adherents of Theravada* and Mahayana* may be understandable. Critical scholarship, on the contrary, has a responsibility to remain unsmeared by such sectarian prejudices. Modern scholarship in Buddhism, which began with the recognition of this sectarian rivalry as representing a major split in Buddhist philosophical and religious ideology, has come a long way in asserting its untenability. However, scholars are now beginning to realize that the Theravada/Mahayana* distinction is an exaggeration and that the fundamental teaching of the Buddha has remained intact throughout the centuries. Now it is time to exorcize the terms Theravada* and Mahayana* from our vocabulary. A major obstacle to the elimination of this distinction is the manner in which Nagarjuna*’s philosophy has come to be expounded by a majority of modern scholars. The present translation of Nagarjuna*’s Karika* and commentary upon each of the verses therein are intended as a corrective to this interpretation.

A careful study of the doctrines in the extensive corpus of Buddhist literature indicates very clearly how certain fundamental ideas have survived, in spite of the occasional appearance of concepts that conflict with the basic teachings of the Buddha and thus produce controversies among the Buddhist thinkers. Without undertaking a careful study of such instances, scholars have rather uncritically lumped together the early discourses of the Buddha and the summaries of their contents that came to be preserved in the so-called Abhidharma, together with all the interpretive texts compiled by some of the later commentators, either in the form of vibhasa* or atthakatha*, and criticized this whole corpus as being representative of Theravada* or Hinayana*. The same is done with some of the Mahayana* discourses (sutra*) and

59
the treatises (*sastra*). The contents of the discourses as well as of the Abhidharma literature are examined only in the light of such commentarial explanations and not independent of them. Modern scholarship has thus failed to extricate itself from commentarial traditions. There seems to be no justification for considering the discourses and even the early Abhidharma literature as sectarian works of the so-called Theravada*. Theravada* or Sthaviravada* in general, and Sarvastivada* and Sautrantika* in particular, may be considered sectarian, but their sectarian views are found not in the discourses and the Abhidharma but in the commentaries that came to be compiled on these two bodies of literature. The elevation of the Abhidharma to the level of a supreme body of literature, more exalted than the discourses and the Abhidharma, is the work of these later commentators and not of the compilers of those Abhidharma texts. The Mahayานists* themselves, bothered by the substantialist thought of the Sarvastivada* and Sautrantika* schools, endeavored to preserve the early teachings by emphasizing the negative aspect of the Buddha's doctrine, especially the doctrine of emptiness (*sānyāsa*). The *Kasyapaśāra* as well as the early *Prajñāparamita* literature represent this reaction to the substantialism of later Buddhism and this literature should be dissociated from the sectarianism that emerged as a result of the attempt at unification in treatises like the *Saddharmapundarika*.

An attempt will be made in the following pages to show that even some of the more prominent philosophers of Mahayana* were really trying to overcome such sectarian interpretations and go back to the non-sectarian form of Buddhism as embodied in the early discourses, without rejecting either the canonical Abhidharma texts that embody positive teachings or the early Mahayana* sutras that emphasized the negative aspect of the Buddha's doctrine.

The present analysis will be confined to the work of Nagarjuna* in India. Once Nagarjuna's* philosophy is critically and objectively analysed, it will be possible to see whether there is any substance to the rivalry between the two major philosophical traditions, Madhyamika* and Yogacara*. That project has to be postponed to a later occasion.

A.K. Warder was one of the first to raise the question whether Nagarjuna* was a Mahayana*.13 His reason for raising that question was that in the *Karika*, which undoubtedly was Nagarjuna's* most significant work, no reference whatsoever is made to any one of the major discourses of the Mahayana* tradition, not even to the famous *Prajñāparamita-sūtras*. Warder believed that the discourse in the *Samyukta* served as a source for Nagarjuna's* treatise, even though he did not specify them. The only discourse referred to by name is *Katyayananavada*, a discourse found both in the Pali Nikayas* and the Chinese Agamas*. This single most important fact has often been overlooked by most of the leading scholars who have written about Nagarjuna*.

Even where this fact has been noted, scholars have assumed that Nagarjuna* was merely referring to the Buddha's rejection of the two extremes of existence (*atthitā*) and non-existence (*nāthitā*) in that discourse and that was all. So far, no published work on Buddhism (available to the present author) has treated the contents of the Buddha's discourse to Kaccayana* in detail before proceeding to analyse Nagarjuna's* thought.

Assuming that Nagarjuna* was a Mahayana* and, therefore, must have rejected any literature that came to be preserved by the Sthaviravadins*, these scholars have proceeded to analyze the *Karika* in the light of their own prejudiced understanding of Madhyamika* philosophy. The ultimate result is bafflement and confusion. Not only are they reluctant to accept certain positive statements of Nagarjuna* in the *Karika*, they are also ready to abandon some of the most important chapters in that work either as later interpolations or as having no relevance to Nagarjuna's* thesis.

To assume that Nagarjuna* was a philosopher who would merely pick out from the Buddha's statements only those that would support or fit in with his own preconceived notions is to do him great injustice. If he was rejecting a theory of elements suggested by the Buddha (as Mufti seems to think), Nagarjuna*, who was one of the most fearless critics of metaphysical views, would have certainly said so. Nor is there any evidence to support the hypothesis that the "Admonition to Katyayana*" (*Katyayanavavada*) that Nagarjuna* was referring to was a version different from the *Kaccayanagotta-sutta* found in Pali and Chinese. The *Kasyapaparivarta* of the *Ratnakuta* contains two discourses, both of which were addressed to Kasyapa* and which deal with the middle path. One of them refers to the middle path and explains it in terms of the twelve factors of the human personality (*dvadasangā*), while the other explains the middle path in negative terms as "non-ceasing, nonarising, etc.".18 This latter version is not found in the Nikayas* and the Agamas*. Nagarjuna* was probably aware of the existence of both these versions and he understood their implications. His *Karika* was an attempt to explain the doctrine without rejecting the contents of any one of them. However, his reference to Katyayana*, instead of Kasyapa*, is extremely significant, in that he was conversant with not only the contents of the *Ratnakuta* versions but also the version included in the Nikayas* and
the Agamas*. For this reason the analysis of Nagarjuna's* philosophy as embodied in the Karika* will be undertaken with a view to locating the sources of those ideas that are accepted by him and those that are criticized and rejected by him.

It is anticipated that an analysis of the Karika* in relation to the "Discourse to Katayana*" as well as other discourses included in the Nikayas* and the Agamas* will lead to a better understanding of the Buddha's philosophy without exaggerating the so-called Hinayana-Mahayana* distinction.

Nagarjuna* and Kumarajiva*

Recent scholarship in the history of Buddhist thought has emphasized a distinction between Indian and Chinese forms of Buddhism. Indian Buddhism is explained as an attempt to deal with causation through karma, while Sinitic Mahayana* is seen as advocating causation through dharma-dhatu*. Early Buddhism, according to the proponents of this thesis, underwent a radical change when it was introduced into China. In order to deal with this question of transition, it would be necessary to provide a complete English translation of Kumarajiva's* rendition of Nagarjuna's* Karika* into Chinese. Richard Robinson made the first systematic attempt to deal with this problem of transition. However, that was done on the basis of an inadequate examination of the first chapter of Nagarjuna* and Kumarajiva*. A careful scrutiny of Kumarajiva's* work has convinced me that the form of Buddhism introduced into China by him was not at all different from that of Nagarjuna*. Thus, if my contention that Nagarjuna's* philosophy is a mere restatement of the empiricist and pragmatic philosophy of the Buddha, the form of Buddhism introduced into China would also be the same as the original teachings of the Buddha with no paradigm changes. And this may account for the survival of Buddhism along side of the equally pragmatic philosophy of Confucianism, whereas it failed to survive in India in the face of a very strong idealistic tradition. The prevalent view that Buddhism, because of its idealistic character, got absorbed into the idealistic tradition in India and failed to remain as a separate entity needs careful scrutiny, especially when a leading philosopher like Nagarjuna* is not seen to advocate such an idealistic view. This calls for a detailed treatment of the Yogacara* tradition in Buddhism that has not yet been attempted.

Nagarjuna's* Buddha

Nagarjuna's* Buddha was no doubt Gautama (see Karika* XXVII.30), the prince from the Sakyan* country (presently part of Nepal) who attained enlightenment and turned out to be the most formidable opponent of almost every major philosophical idea that came to be presented by the Indians. In fact, as will be explained below, the philosophical atmosphere was so confused during the Buddha's day that sometimes he was forced to coin new terms to express his thoughts.

Two of the major philosophical theories that dominated the Indian scene during this time were (1) existence (sat, astitva), proposed and developed for centuries by Indian thinkers since the time of the early Vedas, and (2) nonexistence (asat, nastitva*), presented by the Materialists reacting against the traditional metaphysics. Existence or astitva was no ordinary empirical existence but the existence of a permanent and eternal substratum in man as well as in all aspects of nature. In man, it was the immutable self (atman*) that remained in bondage to the impermanent psychophysical personality and which returns to its ultimate abode, the universal self (Atman*), once it is freed from that bondage and reaches its ultimate moral status (Brahman). Attempting to explain the origin of this reality in man as well as in nature, some of the traditional philosophers settled for a conception of a creator god. As it is, this may not have generated much protest from the Buddha. However, the Indian philosophers were not satisfied with the simple notion of a creator god. At a very early stage, they asserted that this self (atman*) was created by a god or gods who determined that it belongs to one or the other of the four social classes: the priestly (brahmana*), the warrior (ksatriya*), the merchant (vaisya*), and the servant (sudra*). Thus, each individual's status was predetermined and unchangeable. It was this particular idea of creation that elicited the most vehement criticism both from the Materialists as well as from the Buddha.

Denying such a metaphysical self, the Materialists moved to the other extreme of advocating the annihilation of the human personality after death, and then also denied any moral responsibility for human actions. Instead, they propounded a theory of the indestructibility of matter.

Kaccayananatta-Sutta*

The Buddha's discourse to Kaccayana*, a discourse whose authority was recognized by almost all the major philosophical schools of Buddhism, becomes meaningful only in the context of the philosophical views mentioned above. Following is the complete text of the discourse as reported by Ananda*:

Thus have I heard: The Blessed one was once living at Savatthi*, in the monastery of Anathapindika*, in Jeta's Grove. At that time the venerable Kaccayana* of that clan
came to visit him, and saluting him, sat down at one side. So seated, he questioned the Exalted one: "Sir [people] speak of 'right view, right view.' To what extent is there a right view?"

"This world, Kaccayana*, is generally inclined towards two [views]: existence and non-existence.

To him who perceives with right wisdom the uprising of the world as it has come to be, the notion of non-existence in the world does not occur. Kaccayana*, to him who perceives with right wisdom the ceasing of the world as it has come to be, the notion of existence in the world does not occur.

The world, for the most part, Kaccayana*, is bound by approach, grasping and inclination. And he who does not follow that approach and grasping, that determination of mind, that inclination and disposition, who does not cling to or adhere to a view: 'This is my self,' who thinks: 'suffering that is subject to arising arises; suffering that is subject to ceasing, ceases,' such a person does not doubt, is not perplexed. Herein, his knowledge is not other-dependent. Thus far, Kaccayana*, there is 'right view.'

'Everything exists,'this, Kaccayana*, is one extreme.

'Everything does not exist,'this, Kaccayana*, is the second extreme.

Kaccayana*, without approaching either extreme, the Tathagata* teaches you a doctrine by the middle.

Dependent upon ignorance arise dispositions; dependent upon dispositions arise consciousness; dependent upon consciousness arises the psychophysical personality; dependent upon the psychophysical personality arise the six senses; dependent upon the six senses arises contact; dependent upon contact arises feeling; dependent upon feeling arises craving; dependent upon craving arises grasping; dependent upon grasping arises becoming; dependent upon becoming arises birth; dependent upon birth arise old age and death, grief, lamentation, suffering, dejection and dispar. Thus arises this entire mass of suffering. However, from the utter fading away and ceasing of ignorance, there is ceasing of dispositions; from the ceasing of dispositions, there is ceasing of consciousness; from the ceasing of consciousness, there is ceasing of the psychophysical personality; from the ceasing of the psychophysical personality, there is ceasing of the six senses; from the ceasing of the six senses, there is ceasing of contact; from the ceasing of contact, there is ceasing of feeling; from the ceasing of feeling, there is ceasing of craving; from the ceasing of craving, there is ceasing of grasping; from the ceasing of grasping, there is ceasing of becoming; from the ceasing of becoming, there is ceasing of birth; from the ceasing of birth, there is ceasing of old age and death, grief, lamentation, suffering, dejection and dispar. And thus there is the ceasing of this entire mass of suffering."

Analysis of the Kaccayaganotta-sutta*

The discourse is delivered in response to a fundamental question in epistemology: "What is a right view (sammaditthi*)?" The Brahmajala-suttanta* refers to sixty-two varieties of views prevalent during the Buddha's day.24 After his enlightenment, the Buddha realized that none of these were satisfactory. He was not willing to subscribe to any one of them. For this reason, many scholars of Buddhism have assumed that the Buddha did not have a view to present. For them, he had no sixty-third view to propound. If that was the case, the Buddha could have admonished Kaccayana* not to be bothered by any view, whether it was right or wrong, true or false. However, that was not the case.

The Buddha proceeds to enumerate two basic views that are prevalent in the world. The sixty-two views referred to in the Brahmajala-suttanta* represent, in one way or another, a proliferation of these two basic views of permanent existence (atthita*, Sk. astitva) and non-existence (n'atthita*, Sk nastitva*). He then provides reasons for rejecting both these views. The reasons are epistemological and therefore deserve detailed examination. "For him, who perceives with tight knowledge, the uprising of the world as it has come to be, whatever view that is in the world about non-existence will not be acceptable."

The two terms of great epistemological significance that occur in the above statement are (1) "perceives" (passati) and (2)"right knowledge" (samma-panna*). There could be no mystery associated with the implications of the first of these two terms. Passati or "perceives" refers to simple, ordinary sense perception, for what is perceived is not something that is mysterious but simply the arising and ceasing of various phenomena in the world. It does not, at least in this instance, refer to a special or unique form of insight not shared by the ordinary people. What makes the difference is "right knowledge" (samma-panna *, or simply panna*), and that difference is then explained in the next paragraph.

The perceptions or sense experience of the ordinary person in the world are generally "bound by approach, grasping and inclination" (upaya-upadana-abhinivesa-vinibandha*). They are colored by one's prejudices, by one's likes and dislikes. If a person is able to avoid such approach, grasping and inclination, if he does not follow his dispositions, then that person would not take a determined
stand and say: "This is my [permanent] self." He would perceive phenomena in the world as arising and ceasing.

The perception of arising and ceasing of phenomena conditioned by various factors is available even to ordinary people who have not been able to completely free themselves from prejudices. Thus, there is a common denominator between the perceptions of an ordinary person and those of the enlightened one. However, the ordinary person continues to worry about a permanent and eternal substance behind phenomena or about a supreme being who is the author of all that happens in the world. He is assailed by doubts about what he perceives. One way of overcoming such doubts is to confine oneself to what is given, that is the causal dependence of phenomena, without trying to look for something mysterious. The Buddha realized that "When phenomena (dhamma*) appear before the brahman who is ardent and contemplative, his doubts disappear, as he sees their causal nature." 25

According to the Kaccayanagotta-sutta*, if a person does not make up his mind that there is a permanent and eternal self and continue to look for it, but, instead, merely understands things as they have come to be (yathabhutam*), as for example, understands suffering (dukkha) as something that arises depending upon conditions, then he does not fall into doubt. In other words, instead of looking for mysterious causes one should start with whatever causes one can discover that are contributory to each situation. Of course, in most cases, past experiences are a good index. Thus, in order to attain such knowledge one does not have to go around looking for a teacher who would transmit that knowledge in a secret session or in some mysterious way. His knowledge would, in that case, not be other-dependent (apara-paccaya* nanam* ev `assa ettha hoti).

On the basis of such knowledge and experience, one is said to have "right view" (samma-ditthi*). "Right view" in early Buddhism is contrasted with "wrong view" (miccha-ditthi*). These two are not contrasted in the way truth and falsehood are contrasted in the pre-Buddhist tradition. In the latter case, what is true is considered to be what exists (sat). Whatever exists, is real, and by definition whatever is real cannot be otherwise. According to this a priori definition, "truth" has to be something that exists always. Yet, what is given to the sense experiences is not available always. Hence it was assumed that what is true is something other than what is given to the sense experiences, and that remains always (sassata) and in everything. It is the ontological truth (atman*) as well as the moral truth (brahman) in everything.

As mentioned earlier, a theory of existence or a theory that says "everything exists" (sabbam* atthi) is wrong, not because it can be proved to be false, but only in the sense that it does not take into consideration the empirically given fact of cessation (nirodha). Hence, it is characterized as "confusion" (musa*, Sk. mrsa*), not as "non-existent" or "un-truth" or "falsehood" (a-satya).

Avoidance of the theory that "everything exists" does not, according to the Buddha, make the opposite view, namely "everything does not exist" (sabbam* n 'atthi), any more true. The reason for this is that this latter theory implies much more than a simple denial of a permanent and eternal substance in man (atman*) or in the universe (brahman). It implies complete discontinuity in phenomena or their annihilation (uccheda), and this too is a wrong view, not because, like the former, it can be proved to be false, but because it is partial in that some aspects of experience like arising (samudaya) cannot be accounted for by such a view.

The Buddha did not worry about discovering strictly logical arguments to reject any one of these views. He merely avoided these two theories in his explanation of existence. Hence his statement: "Without approaching either extreme, the Tathagata* teaches you the doctrine by the middle" (ete te ubho ante anupagamma majhena tathagato* dhammam* deseti).

The Buddha clearly distinguished his philosophy from that of his contemporary, Sanñjaya Bellatthiputta*, who refused to make any pronouncements through fear that he would be found fault with. 26 It makes no sense to assume that the Buddha, after criticizing the two extreme views, avoided propounding any view or observed complete silence. Such an assumption would undermine the authenticity of almost all the doctrines attributed to the Buddha and would stand in the way of appreciating the greatness of this philosopher and spiritual leader whose message did not fade into oblivion, as in the case of the skeptic Sañjaya Bellatthiputta*, but instead became a formidable world-view throughout the last twenty-five centuries. For this reason, the final conclusion of the Kaccayanagotta-sutta* can in no way be ignored as a later interpolation by the so-called Theravadins.

In this final statement, the Buddha was attempting to explain the human personality as well as its experiences in the world in terms of the principle of dependence, without resorting to the two extreme views that he criticized earlier. In the first part of that explanation, he was describing the personality in bondage, as it evolves conditioned by "approach, grasping and inclination." This is the twelvefold formula (dvadasanga*) presented in positive terms,
describing the functions of ignorance, dispositions, and behavior prompted by such dispositions in the matter of propelling human beings into states of unhappiness and suffering as well as continued process of births and deaths. The negative statement explains how, as a result of the elimination of that ignorance and the development of insight, one comes to pacify one’s dispositions and thereby eliminate suffering as well as the continued cycle of births and deaths. Such is the conclusion of the Kaccayaganottasutta*.

The Kaccayaganottasutta*, though brief, lays down in no unclear terms the basic teachings of the Buddha. Further elaboration of this philosophy is available in the huge collection of discourses of the Nikayas* and the Agamas*. Although denying existence and non-existence conceived of in such a metaphysical manner, the Buddha recognized existence and non-existence in a more empirical sense, such existence and non-existence being understood in terms of the experience of consequences or effects (attha, Sk. artha). Thus, while being aware of the metaphysical implications of the nominalized forms: “existence” (atthi-ta*) and "non-existence" (n’atthi-ta*), the Buddha continued to use the verbal forms “exists” (atthi) and "does not exist" (n’atthi) to explain his view of existence.27

The existence of things as well as their arising and passing away are clearly expressed in the famous formula: When that exists, this comes to be; on the arising of that, this ceases (this arises. When that does not exist, this does not come to exist. When that exists, this comes to be; on the arising of that, passing away are clearly expressed in the famous formula: 28

An attempt to explain the manner in which a phenomenon gives rise to or produces another phenomenon, how a cause gives rise to an effect, would have involved him not only in the task of unravelling the essence or substance in a cause that produces the effect but also in the job of predicting the effect arising from a cause with absolute certainty, a job for which he did not have the necessary empirical means. The Buddha decided to explain this process in terms of “dependence.” He was thus led to speak of an event that has occurred (samappanna) by tracing it back to a condition or set of conditions upon which it depended (paticca *). Having analysed the process of becoming (bhava) in this manner, he laid down a principle that would explain future occurrences. Thus, from observing “dependently arisen" (paticca-samappanna*) phenomena, he asserted the principle of “dependent arising" (paticca-samappada*). That terminology is indeed conspicuous by its absence in the pre-Buddhist Indian literature.

The old Indian term dharma was retained by the Buddha to refer to phenomena or things. However, he was always careful to define this dharma as "dependently arisen phenomena" (paticca-samappanna-dhamma*). Most of the controversies of the later Buddhists centered on this conception of dharma, and therefore the various uses of the term in the Buddha’s discourses may be appropriately examined here.

The term dhamma (Sk. dharma) has four related uses in the early discourses. (1) Dhamma* (in the plural) meaning phenomena or things.32 These are the dependently arisen phenomena referred to earlier. They may also be described as elements of experience. (2) Dhammo (in the singular) meaning the uniformity of phenomena or things as represented by the principle of dependence (paticca-samuppada*).33 (3) Dhamma* (in the plural) referring to things or phenomena evaluated as good or bad in an ethical sense.34 While good is often designated dhamma*, the notion of bad is expressed by its negation, a-dhamma*. (4) Dhammo (in the singular) expressing the uniformity of moral phenomena, which also represented the ideal or the standard of morality derived from the moral perfection attained by the saint. Hence, nibbana* or freedom is also called dhammo.35

In order to distinguish this notion of dhamma from the Indian conception where the term dharma meant reality (atman*), in an ontological sense, the Buddha utilized the conception of result or consequence or fruit (attha, Sk.
artha) to bring out the pragmatic meaning of dhamma. For the Buddha, whatever is true or real (bhuta *, taccha) is also what produces result (attha-samhita*).36 This pragmatic definition of truth or reality was more often used in explaining moral phenomena. Hence the reference to the three types of results or consequences or fruits:

1) bad, evilan-attha, corresponding to a-dhamma.
2) good, beneficial attha, corresponding to dhamma, and
3) ultimate good, ultimate fruit param' attha, corresponding to nibbana*.37

Buddha's Conception of Language and Truth

While the term dharma, in the four contexts referred to above, may be taken as implying empirical truths, a more comprehensive use of the term is also available. In this case, the dharma (or sad-dharma) expresses the notion of "true doctrine," and without any hesitation this may be explained as a "true statement," a use that may be most appealing to the modern linguistic philosopher who is generally averse to metaphysics and insists that "truth" pertains to statements. The use of the term dharma in this sense at once renders futile any attempt to speak of a linguistically transcendent truth or reality in the Buddhist context.

Dependent arising is the middle path presented by the Buddha between the extremes of eternalism and annihilationism, of strict determinism and chaotic indeterminism, of absolute reality and nihilistic unreality, of permanent identity and absolute difference. Considering the manner in which he explained the middle position between these extremes, no one could maintain that this middle position is beyond linguistic description or transcends any form of verbal expression. In fact, the two terms that are generally utilized in the absolutistic systems of Indian thought to present such a standpoint, namely "indescribable" (avacya*) and "indefinable" (anirvacaniya*), do not occur in the early discourses of the Buddha. The term "undeclared" or "unexplained" (avyakata*) occurs, but it is used to refer to problems such as the duration and extent of the universe, the identity of or the difference between the soul and the body, as well as the status of the tathagata* after death these being problems that could not be explained on the basis of any empirical evidence.38 For the Buddha, whatever is empirically given is also describable or definable without having to assume metaphysical standpoints.

Thus in the Buddha's view language is not, in itself, an inadequate means of expressing what is empirically given. Yet modern interpreters of Buddhism seem to assume that the Buddha considered language inadequate to express the truth about existence that he discovered. The evidence for such an interpretation is rather dubious. No attempt is made to examine the Buddha's own statements about his enlightenment, as recorded in such discourses as "The Noble Quest" (Ariyapariyesana). 39 Most books on Buddhism published in the modern world will attribute to the Buddha, as well as to his early disciples and even to the later ones like Nagarjuna*, a distinction between sammuti and paramattha. Sammuti (Sk. samvrti*) is explained by Candrakirti as language40 and paramattha (Sk. paramartha) as ultimate reality or absolute truth.41 The terms sammuti as well as vohara* occur in the early discourses.42 Sammuti, (derived from sam + man "to think") literally means "agreement" and therefore, "convention". Vohara* (Sk. vyavahara*) means "usage." A rather lopsided interpretation of these two terms as implying "language" only has caused havoc in the explanation of the teachings of the Buddha as well as of Nagarjuna*. There seems to be no justification for confining the meanings of these two terms to language only.

Conventions (sammuti) are of various types linguistic, social, political, moral or ethical, or even religious. Even a superficial glance at pre-Buddhist literary traditions would reveal the manner in which the Indians elevated linguistic, social, political, moral, and religious conventions to the level of absolute realities, permanent and eternal. The language of the Vedas became the absolute language, possessing miraculous powers. In spite of the existence of such languages as Dravidian and Chinese, which have nothing to do with the Vedic language, some educated Indian scholars still believe the Vedic is the mother of all languages. Therefore not a single syllable of it is to be tampered with. Another convention, the social order consisting of four castes, came to be considered absolute. Punishment awaited those who violated it or ignored it. Arjuna was to be rewarded for maintaining that social order. Political conventions derived their absoluteness from the absoluteness of the social order. A rules (ksatriya*) who ignores the advice of the spiritual leader and guide (brahma*) was doomed to failure, since he was thereby ignoring the law (dharma). The absoluteness of the moral and ethical conventions was equally recognized. No other form of morality except that which contributes to the preservation of the social system was permissible. Religious duties were specific and unalterable.

When, in the Sutta-nipata*, the Buddha spoke of sammuti, he was referring to all these different kinds of conventions.43 According to him, these conventions have come to be depending upon specific conditions (puthujja*).
They were not absolute and ultimate; they were not universally binding. The Buddha realized that when these conventions were considered to be absolute and ultimate (paramam *) they contributed to the worst form of dogmatism (dīthī*), which eventually led to all the conflicts (kalaha, vīggha) in the world. These constituted the worst forms of obsession, obstruction, constraint, or bondage. Therefore, the Buddha claimed that a wise man (vidva*) does not approach (na upeti) such conventions. This does not mean that he ignores all conventions. Instead, he understands their conditionality and as well as their fruitfulness without elevating them to the level of ultimate realities, thereby making them absolute, or simply ignoring them as absolutely unreal and therefore useless.

Freedom (nībbana*) could then be interpreted more appropriately as freedom from obsessions, obsessions for as well as against such conventions. The elimination of such obsessions or constraints (pāpañca) turned out to be more difficult than abandoning pleasures of sense, for if by freedom was meant only the latter, the Buddha could have attained enlightenment during the time he was practicing self-mortification.

Here again, the difficulty lies in adopting a middle path without accepting conventions as being ultimate or rejecting them as being useless. The uniqueness of the Buddha’s philosophy lies in the manner in which a middle path can be adopted with regard to any convention, whether it be linguistic, social, political, moral, or religious. Since the present analysis of the Buddha’s philosophy is undertaken only as a prelude to the examination of Nagarjuna’s* thought, and since the latter was more concerned with the basic doctrines of the Buddha, our attention at this point will be focussed only on the way in which the Buddha adopted the middle path in dealing with linguistic conventions.

As pointed out above, the term sammuti was used in the early discourses to refer to all kinds of conventions. However, there were two terms that were very specifically employed to refer to linguistic conventions. They are nirutti-patha (the way of etymology) and adhivacana-patha (the way of definition). The Samyutta-nikaya* contains an important discourse dealing with linguistic conventions, which are neither to be clung to as absolute truths, nor to be ignored as mere conventions. The discourse called Nirutti-patha runs thus: There are these three linguistic conventions or usages of words or terms, which are distinct, have been distinct in the past, are distinct in the present and will be distinct in the future and which are not ignored by the wise brahmans and recluses. Whatever material form (rupa*) that has been, which has ceased to be, which is past and has changed, is called, reckoned and termed ‘has been’ (ahosi) and it is not reckoned as ‘it exists’ (atthi) or as ‘it will be’ (bhavissati).... [This is repeated for the other four aggregates: feeling, perception, dispositions and consciousness.] Whatever material form has not arisen nor come to be, is called, reckoned or termed ‘it will be’ (bhavissati) and it is not reckoned as ‘it exists’ (atthi) or as ‘it has been’ (ahosi).... Whatever material form has arisen, and has manifested itself, is called, reckoned, or termed ‘it exists’ (atthi), and it is not reckoned as ‘it has been’ (ahosi) nor as ‘it will be’ (bhavissati). 46

The Buddha advised his disciples “not to cling to dialectical usage nor go beyond the limits of linguistic convention” (janapada-niruttim* nabhiniveseyya* samannam* natidhaveyya*). Such being the middle position adopted by the Buddha regarding linguistic convention, it would be an extreme position to maintain that language is either ultimately real (as it was the case with the Indians who made vac a supreme god) or that it is useless when it comes to expressing ultimate reality.

For the Buddha, language derives its “meaning” (attha) when it is able to produce results (attha), and thus what is true (bhuta*, taccha) is that which bears results (atthasamhita*). The Buddha did not recognize anything that is false to be productive of results. Truth in this sense can be equated with “meaningful” language. Thus, linguistic expressions that imply permanence and annihilation would be “meaningless” (an-attha) in that they do not communicate anything that is given in experience (dhamma), where experience is understood in terms of the felt results (attha) rather than in terms of an indefinable ultimate reality.

Having thus rejected the two views, namely, the traditional Indian view that the human personality consists of a permanent and eternal spiritual entity (atman*) and the Materialist view the denied such a spiritual entity and recognized matter (body) to be the only reality, the Buddha continued to speak of the psychophysical personality (nama-rupa*), referring to it with such terms as “I” (aham*) and “you” (tvam*) and even the term “self” (atta) when speaking of that personality.

With the emergence of Buddhism as a formidable philosophical and spiritual movement that undermined the very foundations of the traditional Indian philosophy and religion, Indian thinkers reformulated their substantialist world-view, presenting it in a more subtle and appealing form in the Bhagavadgīta*. The notion of dharma embodied in this text may be analysed in terms of the three Buddhist categories presented above, namely, an-artha, artha and paramartha*. Instead of the pragmatic definitions of the
Buddhists, the Indian thinkers were presenting a more substantialist interpretation where,

1) an-artha = the psychophysical personality (nama-rupa*) which is unreal and which is contrasted with the real self (atman*).

2) artha = the permanent and eternal self (atman *) in man, the so-called dehin (the dweller in the body), which is in bondage because of attachment to the psychophysical personality, and

3) paramartha* = paramatman*, which is the ultimate reality, the universal self identified with God.

Thus was inaugurated an enormous controversy between Buddhists and Indian philosophers that continued to rage for several centuries until Buddhism completely disappeared from the Indian soil as a philosophical and spiritual force around the seventh and eighty centuries, only to survive and flourish in the countries south and southeast of India as well as in the Far East. The Pfrior of the Sravakas*

The survival of a pragmatic philosophy in the face of an extremely absolutistic tradition such as the one embodied in the Bhagavadgita* was not easy. One of the ways in which the Buddhists responded to that philosophy was by compiling the now famous Buddhist classic, the Dhammapada. As the title indicates, it was an attempt to counter the Indian absolutist and substantialist definition of dhamma. The Buddhist philosophers, confronted by the onslaught of Indian thinkers asserting the reality of the self (atman*), spent most of their time analysing what they called dhamma in order to show that there was no permanent and eternal self. As Kenneth Inada has rightly remarked, this represented “the most active, highly vibrant and competitive age in Buddhist history known as the Abhidharmika period.... If there are high watermarks to be found in Buddhist history, the Abhidharmika period certainly rates a very high level, a level of great fermentation and flourishment of Buddhist thought. Ideologically speaking, no other period in Buddhist history, whether of the Theravada or Mahayana, or even national Buddhist developments such as in T’ang Dynasty China, could ever match, or come up to the level of activity as recorded during this period.”49

Two complete sets of Abhidharma texts compiled during this period are available to us. One is preserved by the Theravadins* consisting of the following texts:

1. Dhammasangani*;
2. Vighanka*;
3. Dhatukatha *;
4. Puggalapnnatti*,
5. Kathavatthu*,
6. Yamaka, and
7. Patthana*.

The other version was preserved by the Sarvastivada* school and comprises one major work and six ancillary texts. They are as follows;

1. Jnanaprasthana* (attributed to Katyayani/putra*),
2. Sangitiparyaya* (attr. Maha* Kausthila/Sariputra*),
3. Prakaranapada* (attr. Vasumitra),
4. Vijananakaya* (attr. Devasarman*),
5. Dhatukaya* (attr. Purna* or Vasumitra*),
6. Dhammaskandha (attr. Siriputra/Maudgilayayana*),
7. Prajnapatisastra* (attr. Maudgilayayana*).

That the Theravada* and Sarvastivada* schools preserved these two bodies of literature does not make them sectarian, any more than the discourses, preserved by any school, could be branded as such. Although the treatment of subject-matter in these two sets of works differs widely, the subject-matter is practically the same. Both deal with the categories into which the human personality as well as human experience came to be analysed in the early discourses where they receive a more discursive treatment. The analysis of human experience into aggregates, elements, and faculties, all of which were considered to be dharmas or elements of existence, seems to be the first and foremost concern of the Abhidharmikas*. Undoubtedly, the purpose of this analysis is to demonstrate the absence of a self or substance in these phenomena. Exhaustive analyses of the various types of relations that obtain among them were also undertaken, providing a sort of scholastic advancement in the study of such phenomena, but still not deviating from the fundamental teachings of early Buddhism. Examination reveals that these two processes in some way represent an attempt to deal with the same issues that the Buddha was concerned with, namely, “dependently arisen phenomena” (paticcasamuppanna-dhamma*) and “dependent arising” (paticcasamuppada*). The knowledge of these two processes was looked upon as right understanding, which ultimately leads to the attainment of freedom (nirvana*).

Unfortunately, two of the schools that were involved in this Abhidharmic* enterprise were driven too far in their academic study of the dharmas, probably by the unrelenting criticisms levelled against Buddhism by the traditional schools of Indian philosophy. These schools
came to be known as Sarvastivada* and Sautrantika*. The Sarvastivada* concluded their analysis of dharmas with the recognition of ultimate discrete atomic elements which they were unable to put together even with a theory of four basic relations. The result was that they were compelled to admit a singularly metaphysical conception of "self-nature" (svabhava*) to account for the experienced continuity of such discrete phenomena. This self-nature could not be looked upon as something impermanent and changing, for that would be to defeat the very purpose for which it was formulated in the first place. Therefore they insisted that this self-nature (svabhava*, dravya) of dharmas remain during all three periods of time, the past, the present and the future. No other conception could be more heretical in the eyes of the Buddhists who were avowed non-substantialists (anatmavadi*).

The view that dharmas have self-nature had its impact on the conception of "dependent arising" (pratijayasamutpada*), the central conception in early Buddhism as well as in the early Abhidharma. Henceforward, "dependence" came to be explained on the basis of self-nature. It turned out to be no more different from the identity theory of causation (satkarya-vada*) formulated with such precision, using logical arguments, by the Sankhya* school of thought. The relationship between these two schools of thought is so close that one can hardly discount mutual influences and borrowings.

One of the schools that reacted against this conception of "self-nature", other than the tradition represented by Moggaliputtatissa* referred to earlier, was the Sautrantaka* school of Buddhism. As its name implies, this school was openly antagonistic to the "treatises" (sastra*) and insisted upon returning to the "discourses" (sutranta*) as sources for the study of the Buddha-word. It considered the notion of "self-nature" as a theory of "self" (atma-vada*),52 and insisted upon the difference (nanatva*) between cause and effect. However, for some inexplicable reasons they failed to realize that neither a theory of atoms (paramanu*) nor a conception of moments (ksana*) was ever part of the early Buddhist teachings, either in the discourses or in the Abhidharma treatises. On the one hand, they probably assumed that these two conceptions were not.53

Even though the Sautrantikas* were openly critical of the substantialist conception of dharma advocated by the Sarvastivadins*, their reluctance to abandon the theory of moments (ksana*) left them with the difficult task of explaining the experienced continuity in the individual person. The emergence of schools like "personalists" (pudgala-vada*) and "transmigrationists" (samkranti-vada*),54 closely related to and sometimes identical with the Sautrantikas*, is indicative of the solutions that this school had to offer in order to overcome the difficulties arising from the acceptance of a theory of moments.

The Sarvastivada* and Sautrantika* schools thus presented a rather complicated set of theories, all contributing to philosophical confusion. The former perceived a "self-nature" (svabhava*) in the cause and emphasized the identity (ekatva) of cause and effect, while the latter, seeing no such "self-nature" but merely perceiving "otternature" (para-bhava*), insisted upon the difference (nanatva*) between cause and effect. The Sarvastivada* conception of self-nature (svabhava*) was extended to all phenomena, including the human personality, while the Sautrantikas*, denying self-nature in phenomena, surreptitiously introduced a conception of self or person (atman*, pudgala) in a human personality.

Moggaliputtatissa*: The First Reformer

The Russian Buddhist scholar Th. Stcherbatsky was one of the fast among Western scholars to ignore the very significant differences between early Buddhism and Abhidharma on the one hand, and Sarvastivada* and Sautrantika* interpretations of the "discourses" and Abhidharma on the other. For him, Sarvastivada* was not only an interpretation of Abhidharma but was Abhidhama, and the early Buddhism of the discourses as well.55 However, there was at least one disciple of the Buddha who was not willing to accept either the Sarvastivada* or the Sautrantika* as the correct interpretation of Buddhism. This was Moggaliputtatissa*. Critical scholarship unfortunately has blindly dismissed his views without much serious consideration, even though they are presented with clarity and logical acumen.

Almost 250 years after the Buddha and 300 years before Nagarjuna*, Moggaliputtatissa* was responsible for the "great purge" in the Buddhist tradition. The Indian emperor Asoka, as he declared in his Minor Rock Edicts, was actually instrumental in unifying the Buddhist Order (samgha*) by expelling the miscreant and schismatist monks and getting them to don white (lay) garments. Yet, the background for this great purge was prepared by Moggaliputtatissa* when in his famous "Points of Controversy" (Kathavatthu*) he refuted the ideas...
presented by almost seventeen heterodox schools of Buddhism. "Moggaliputtatissa* is said to have followed the method of discourse adopted by the Buddhhasatthara* dinna-naya-vasenaat the time he established the matika *, 'topics' of the K[atha]*v[atha]*.56 This monumental work is an attempt to go back to the early teachings, and in doing so the author, for the first time in Buddhist history, utilizes even abstract logic. Whether the use of such abstract logic is appropriate is not a matter that concerns us here. What is important is that Moggaliputtatissa* was critical of certain ideas which were incompatible with the Buddha's philosophy. The metaphysical theory of a person (pudgala), propounded by the Sautrantikas* and their allies, was the first of the metaphysical views to be taken up for criticism in the Kathavatthu*.57 With great ingenuity and logical precision, Moggaliputtatissa* destroyed the concept of a person propounded by the Sautrantikas* and established what may be called the non-substantiality of the human personality (pudgala-nairatmya*).

With equally cogent arguments, he annihilated the Sarvastivada* doctrine of dharma that implied substantial and eternal existence (sabbam * sabbada* atthi*)58 and established the non-substantiality of all dharmas (dharma-nairatmya*). These two uncontroversial achievements, recorded in one of the most authentic texts, have been completely ignored by those who attributed a substantialist view, gradually gaining ground in the Buddhist tradition, to the Early Mahayana*: The Second Reform Movement

The same text highlights another controversy that was beginning to ruffle the minds of Buddhist thinkers during the third century BC and which became the topic of a heated debate during the first and second centuries AD. This pertained to the question whether the Buddha is transcendent (lokuttara). Moggaliputtatissa* rejected the view, gradually gaining ground in the Buddhist tradition, which favored transcendence.59 The biographies of the Buddha, like the Mahavastu*, were probably not yet written. Mahayana*, with its conception of a completely transcendent Buddha, had not come into existence by that time. The Saddharmapundarika*, which is responsible for condemning the miscreant monks (biksu*) as well as the ideal of a saint (arhant) in early Buddhism, indicates a gradual growth with the final version assigned to the third century AD. In the earliest versions of some of the early Mahayana* sutras*, such as Vajracchedika-prajnaparamita* and the Kasyapaparivarta*, there is no mention of a bodhisattva.60

What sort of Mahayana* can there be without the conception of a transcendent Buddha and the notion of a bodhisattva? It certainly ought to be different from the kind of Mahayana* that one comes across in the available versions of the Saddharmapundarika* and other texts that include a condemnation of the early arhant-ideal. Indeed the Kasyapa-parivarta*, even in the Sanskrit version which is not the earliest, will enable us to understand what that original Mahayana* was. It was not the Mahayana* that came to be deeply prejudiced against early Buddhism as well as Theravada*, for, as pointed out earlier, even though we find a strong criticism of the monk (biksu*), a criticism that may be accepted even by the Buddha and his disciples like Moggaliputtatissa*, this criticism is not extended to the early ideal of the "worthy one" (arhant). One of the most important series of discourses or instruction (dharma-paraya) referred to in the Kasyapaparivarta* as "the great pinnacle of gems" (maha-ratna-kuta*), pertains to the "middle path" (madhyamapratipat*).61 Here we find a long list of middle paths, most of which are described in negative terms.

However, side by side with the negative descriptions, one also discovers a positive description of the middle path in terms of the twelve factors of the human personality (dvadasanga*). It is indeed an abbreviation of the Kaccayanagotta-sutta*, with Kasyapa* as the interlocutor or the person to whom the discourse is addressed. The need for negative descriptions, especially at a time when Buddhahood was not yet looked upon as a transcendent state or as an Absolute, calls for an explanation. Available historical records indicate that some of the canonical texts that emphasized the doctrine of non-substantiality (nairatmya*), and which included the work of Moggaliputtatissa*, found a haven in Sri Lanka and other South East Asian countries after the third century BC. However, some of the early discourses as well as some of the Abhidharma texts were still circulating in India and came to be preserved in a Prakrit, slightly different from Pali. Yet, what came to be popular after the third century were the interpretations of the Buddhist metaphysicians, like the Sarvastivadins* and the Sautrantikas*. The early Mahayana* that did not include either the concept of "transcendence" as applied to the Buddha or a notion of bodhisattva, but which emphasized a negative doctrine while at the same time preserving the positive assertions of early Buddhism, was therefore a response to the Sarvastivada* and Sautrantika metaphysics, rather than a reaction to the early Buddhism of the "discourses" or the Abhidharma.

[The "Overview" of the whole text included above ("Nagarjuna's Mission" & "The Structure of the Karika") comes at this point in Kalupahana’s introduction.]
Nagarjuna’s Philosophical Enterprise

The above analysis of the contents of Nagarjuna’s *Karika* and the annotation of individual verses that follow provide ample evidence to support the view that his primary objective was to reject the substantivalist or essentialist thought that emerged in the Buddhist philosophical tradition as a result of the speculations of the Sarvastivadins and the Sauntradikas. The fact that he depended upon the teachings embodied in the early discourses, or the fact that the *Karika* is here looked upon as a grand commentary on the *Kaccayana-gotta - sutta*, in no way minimize his contribution to the history of Buddhist thought. What is most significant is the manner in which he proceeded to examine the subtle and complex metaphysical issues that blinded the Sarvastivadins and the Sauntradikas in a background in which speculative philosophy had reached a high watermark, both among the Buddhists and the traditional Indian philosophers. Nagarjuna probed into almost every aspect of their speculations, whether relating to epistemology, ontology, moral philosophy, or philosophy of language. He linked disjointed concepts and dissolved the hardened and the solidified. Concepts of identity and difference, substance and quality, self-nature and other-nature, permanence and annihilation, even in their most subtle and imperceptible forms, never escaped his penetrating intellect. It seems as if he had read the Buddhist discourses, manuals, and commentaries, examining every sentence, every word, and every syllable. Even if one cannot discover any tangible evidence to provide that he was a “freed one”, a nivṛta, the *Karika*, indeed, bears ample testimony to his supreme intellectual stature.

Epistemological Investigations

Nagarjuna was an empiricist *par excellence*. However, the fundamental metaphysical assertion of most rationalists, and even the empiricists during his day, was the *cogito*, the *atman* that sees itself before it comes to perceive anything else. Nagarjuna had no hesitation in demolishing this metaphysical idea at the very outset. “Seeing oneself” (*svatmanam darsanam*) is rejected, not on the basis of any dialectical argument, but simply on the grounds of its non-availability (III.2). Comparable to the manner in which David Hume refused to accept the notion of a *cogito*, Nagarjuna proceeds to show that the so-called process of “seeing oneself” is no more than “the arising of consciousness depending upon the eye and visible form” (*caksu-rupe pratityaivam ukto vijnana-sambhavah*), III.7), that is, a perception of some color, shape, etc. However, Nagarjuna differs from Hume in not recognizing these perceptions as momentary and discrete impressions on the basis of which we construct our world-view.

Momentariness, along with its philosophically unacceptable consequences, was rejected, especially in his treatment of “motion” (*gaṇatagata*, II) and “time” (*kāla*, XIX).

That Nagarjuna was rejecting sense experience in favor of a special intuition is not at all evident from his treatment of sense experience in Chapter III. His relentless criticism of a metaphysical *cogito* does not mean that he was evading the problem. On the contrary, he was quoting a statement from the Buddha to show what a non-metaphysical description of sense experience could be. That description in terms of “dependence” is further elaborated in Chapter XXVI where he presented a quite positive explanation of the human personality as well as its experiences.

Indeed, if “emptiness” (*sunyata*) were to be an “ultimate reality,” there was no reason why Nagarjuna should not have devoted at least one chapter of his work solely to explicate this conception and provide information regarding its epistemological basis. At least a chapter on “wisdom” (*jnana*), explaining how it penetrates into the ineffable ultimate truth, abolishing all linguistic conventions in the process, would have established the basic philosophical standpoint attributed to the Mahayana schools by most classical and modern scholars. No such attempt is made in the *Karika*. On the contrary, the term that he most frequently uses is *pasyati*, meaning “perceives.” He uses it in the same sense in which the Buddha utilized it in the “Discourse to Katyayana.” Often what he claims not to perceive (*na pasyati*) is self-nature or substance (*svabhava*) or permanent existence (*bhava*, *astitva*). What he claims to perceive (*pasyati*) is dependently arisen phenomena as well as dependent arising. Such perceptions are not presented as the results of a special intuition, but primarily of the absence of ignorance (*avidya*) or confusion (*mṛsa*) created by one’s dispositions or inclinations for the extremes of substantial existence and nihilistic nonexistence.

Picking up the most important epistemological theme from the Buddha’s discourse to Katyayana, Nagarjuna is insisting that when one perceives through wisdom (*jnana*) the arising and ceasing of phenomena, one abandons the two metaphysical explanations of that experience. Indeed, the theme that is emphasized is not the *perception* of a non-arising and non-ceasing ultimate truth, but rather the *non-perception* of a metaphysical entity that is non-arising and non-ceasing. Thus, for Nagarjuna, sense experience, explained as a process of dependence, serves as the foundation of human knowledge. Concentrating his attention on this foundation of human knowledge and understanding, Nagarjuna not only leaves out any discussion of special intuitions not related to sense experience, but also avoids any reference to the so-called...
“extraordinary perceptions” (abhijnā), probably because such perceptions had by this time come to be considered absolutely independent of sensory experience, even though this was not the way in which the Buddha perceived them. 136 Nagarjuna may have been aware that, even according to the Buddha, human beings whose six sensory faculties are not functioning properly could not develop such perceptions. For example, in the early discourses, one cannot come across any reference to someone who is blind by birth developing “clairvoyance” (dibba-cakkhu) or one who is deaf evolving the capacity for “clairaudience” (dibbasota).

Furthermore, Nagarjuna seems to have directed his attention more to the fundamental problems that generated metaphysical theories. And the problem of sense experience, indeed, was at the very top of that list. As reiterated in the above analysis of the Karika as well as in the annotation of the text that follows, the empiricist Nagarjuna continued to insist upon experience from experience for any idea before it is accepted. The repeated use of the phrases: na vidyāta (meaning “not evident,” “not known,” “not perceived,” etc.) and nopalabhyate (implying “not obtained” or “not available”) bears ample testimony to his predominantly empiricist attitude. In the absence of any positive evidence that Nagarjuna rejected sense experience and accepted a higher “intuition,” there is no reason to doubt that he was calling for evidence that is provided by sense experience. In fact, whenever the phrase na upapadīyate (“is not proper,” “not appropriate”) is used to describe a situation, it would often follow a statement implying that it is not evident (na vidyāta). This means that rational or logical arguments attempting to draw implications need to be strongly grounded on empirically verified premises. A thesis had to be first found fault with before its antithesis is faulted. “Serf-nature is not evident” (na hi svabhavo... vidyate), not because “other-nature” (parabhava) is not evident, as would seem to be the case if Nagarjuna were to merely utilize the method of reductio ad absurdum (prasanga). Serfnature (svabhava) is not evident, because it is not available in experience. It is only after such a straightforward empirical statement that Nagarjuna proceeds to reject “other-nature” (parabhava), for this latter would make no sense without the conception of “self-nature.” Indeed, it is the unknowability of selfnature (avidyamane svabhava) that destroys the very conception of other-nature (I.3), not simply the relativity of the two differentiated concepts.

Ontology

Just as much as the assertion of a cogito led to the belief in a substantial agent, a pudgala, the lop-sided attempt to dissolve that concept insisting that it is dependent upon the elements of experience (dharma) led to a substantialist view relating to the objective world. The conception of a person was replaced by a substantial world. The Buddha had spoken of obsession (prapañca) as the reason for such world-views. Hence his emphasis on the “appeasement of obsessions” (prapancopasama) as a means of overcoming metaphysics. Looking at the philosophical background in which the objective world had replaced the cogito as an ultimate reality, Nagarjuna was more specific in insisting upon the “appeasement of the object” (drastavyopasama) as a means to attaining true knowledge (V.8).

In fact, the Sarvastivadins and Sautrantikas, while denying the substantiality of the human person (pudgala), had moved to the other extreme of admitting the substantiality of elements (dharma). This problem being foremost in Nagarjuna’s mind, he devoted the second part of his treatise to its refutation. In this case, he realized that even critical philosophy had fallen prey to the ordinary human search for security and absolute certainty when philosophers, compelled to give up something that provided them with some sort of certainty (and in this case the cogito), were clinging like leeches to an objective world as an ultimate reality. If Nagarjuna were to be an empiricist like the Buddha, he could not confine himself to a world of abstract ideas. He knew that the Buddha was a “verificationist” (ehipassikā) and that this involved concrete “identification” (to use a term popular in modern philosophy).137 Thus, the conception of a person begins with an identifiable and re-identifiable “form” (rupa). While the Buddha recognized the possibility of experiencing formless (arupa) states, it is not very clear whether he had accepted “formless” persons. However, unlike some modern philosophers who would consider the “body” or material form to be fundamental and, therefore, ultimately real, leaving all other constituents as being secondary, the Buddha would merely look upon the “body” as a necessary but not sufficient part of the human person. For him, feeling (vedana), perception (sanna), dispositions (sankhara), and consciousness (vinnana) were as important as the material body in making any identification or re-identification. Thus, the elimination of the cogito by explaining it as something that is dependently arisen (paticcasamuppanna) did not mean the recognition of the ultimate reality of these conditions upon which it depended. Hence the Buddha’s famous dictum: “All things are non-substantial” (sabbe dhamma anatta).

For this reason, Nagarjuna’s first major enterprise in the Karika is to establish the non-substantiality of the elements (dharma-nairatmya). This called for a critique of the Sarvastivada conception of substance (svabhava). As mentioned earlier, the epistemological method by which he
tried to achieve this was “appeal to experience”. In other words, he was calling for identification of substance, which none of his opponents were able to do.

However, Nagarjuna believed that an identification of an event can be made on the basis of “fruit” or “effect” (artha), for, according to him, in the absence of a fruit, one cannot speak of a condition or non-condition (I.14). This is a pragmatic theory of truth or reality. However, if his substantialist opponents were to insist that the substance can be identified through its fruit or effect, Nagarjuna’s immediate response is that the fruit or effect is dependent upon a condition (or a set of conditions), whereas substance is not. The definition of substance (svabhava) as “having its own (svo) existence (bhavo)” stood in the way of Nagarjuna accepting his opponent’s explanation. “How can a substance be conditioned?” (svabhavah krta nama bhavisyati punah katham, XV.2) grumbled Nagarjuna. For him, the conception of a “dependent substance” was no more than a self-contradiction (XV.1).

Having criticized the substantialist theory of elements (dharma), Nagarjuna had to return once again to the conception of a person, even though he had begun his treatment of the non-substantiality of elements by rejecting a substantialist conception of a person (Chapter III). The reason for this is not far to seek. The Sautrantikas, who had themselves rejected the Sarvastivada conception of substance (svabhava), were surreptitiously introducing a subtle personality (pudgala) to account for human behavior, moral responsibility, bondage, and freedom. Chapters XVI-XXVI were, therefore, devoted to the explanation of the human personality without falling into the substantialist trap.

Unlike some of his predecessors and most of his modern day admirers, Nagarjuna was indeed cognisant of the possible dangers involved in a “non-substantialist discourse.” He was aware that the idea of non-substantiality could eliminate even the empirical conception of a person (pudgala) and of elements (dharma) and enthrone itself as the ultimate truth or reality. Hence his rather bold declaration: “Those who are possessed of the view of emptiness are said to be incorrigible.” (XIII.8)

An absolutist view of emptiness would certainly contradict his empiricist method that calls for identification as a test of truth or reality. “Non-substantiality” (nairatmya) or “emptiness” (suniya), taken in themselves, would be as abstract and unidentifiable as a substance (svabhava). Indeed, as pointed out earlier, the notion of a substance was rejected because it could not be identified with anything in experience. Therefore, there was no excuse whatsoever for replacing “substance” with an equally undefinable or unidentifiable conception of “emptiness” or “nothingness.” “Emptiness” (suniya) distinguished from “the empty” (suniya), “nonsubstantiality” (nairatmya) separated from the “non-substantial” (nairatmya-dharma) or “dependent arising” (pratityasamutpada) differentiated from “the dependently arisen” (pratityasamutpanna-dharma) would be as unidentifiable and therefore nonsensical as any other metaphysical conception that Nagarjuna was endeavoring to refute.

Thus, for Nagarjuna, emptiness (suniya) was no more than what is implied in the statement: “All this is empty” (sarvam idam sunyam). The statement, “All this is empty,” is not identical with the statement, “All is empty,” (sarvam sunyam). In fact, as pointed out in the annotation, nowhere in the Karika can one come across an absolute statement such as “All is empty.” It is indeed significant that even when making a universalized statement Nagarjuna retains the demonstrative “this” (idam) in order to eliminate the absolutist sting.

The question whether one can speak of “emptiness” (suniya) of “emptiness” (suniya) is often raised in discussions of Nagarjuna’s “middle way.” For example, one could maintain that “emptiness” itself is an identifiable particular on the basis of which a universal “emptiness” could be identified. The language utilized by Nagarjuna does not permit such a flight into the realm of the Absolute. His conception of “the empty” (suniya) is a particular. Yet this particular is not equivalent to a particular “emptiness” (suniya) abstracted from a concrete situation. To move from “the empty” to “emptiness” is an altogether different process. The former is grounded in an experienced situation of an event with a characteristic, while the later begins with a characteristic sans the event.

This careful avoidance of any absolutism or substantialism in relation to the conception of “dependent arising” (pratityasamutpada) as well as “emptiness” (suniya) was declared by Nagarjuna as the “middle path” (pratipat saiva madhyama, XXIV. 18). That “emptiness” is a “dependent convention” (upadaya praññapti), for it is dependent upon and, therefore, identifiable in terms of, “the empty” (suniya). Nagarjuna asserts that “emptiness” so identified would eliminate any dogmatism or obsession (adhilaya) and, along with it, any erroneous views (dosaprasanga, XXIV. 13).

This, undoubtedly, is a beautiful restoration of the Buddha’s conception of “non-substantiality” (anatta). However, the modern interpretation of Nagarjuna seems to move in a totally different direction. Modern scholars, favoring an interpretation by Candrakiti made known to them by T. R. V. Mufti, insist that Nagarjuna had no thesis
of his own (svapaksa) to present. This Vedantic interpretation presents Nagarjuna as a critical or analytical philosopher whose sole function was to criticize or analyze (vigraha) views presented by others without having to recognize or uphold a view of his own. Such an interpretation has led to two more related theories being attributed to Nagarjuna. The first is the admission of the inadequacy of conceptual thinking, and therefore of language, to express the ultimate truth. The second is the attribution of a concept of ultimate truth in the form of “absolute emptiness” or “absolute nothingness” inexpressible through ordinary human linguistic apparatus. Thus, we are led to one of the most troublesome questions relating to Nagarjuna’s philosophical enterprise.

In the annotation of the dedicatory verses of the Karika, we have suggested a different reading which would make it possible for Nagarjuna to make the claim that he is presenting a right view (samyag-drsti) when refuting the inappropriate views advocated by his opponents. Furthermore, Nagarjuna clearly indicates that philosophical enterprise consists not only of analysis (vigraha) but also explanation (vyakhyana) (IV.9). This would provide legitimation for the most positive explanation of the Buddha’s view in Chapter XXVI, in addition to other positive statements made by Nagarjuna elsewhere (e.g., Chapter XVII).

However, the two most troublesome questions regarding ultimate reality and the inadequacy of language still remain, primarily because of the manner in which the Vedantic scholars interpreted three related terms utilized by Nagarjuna. These are pramartha, nirvikalpa, and samvrty.

For most scholars who have been nurtured in a predominantly substantialist philosophical or religious tradition, pramartha means “ultimate reality,” nirvikalpa implied “the non-conceptual,” and samvrty stood for “language.” In understanding these three terms in this manner, did modern translators and interpreters impose their own substantialist outlook on Nagarjuna’s thought? The lust test of the validity of such translations would be a comparison of the implications of these three translations with the Buddha’s own conceptions of “dependent arising” (pratityasamutpada) and “non-substantiality” (anatman), all of which Nagarjuna accepted with reverence.

Philosophy of Language

The term samvrty (Pali, sammuti) was never used in the early discourses to refer exclusively to language. Analysing the Buddha’s philosophy on the basis of the early discourses, it was pointed out that sammuti, vohara, and paññatti were terms used to refer to any convention, not merely linguistic convention. The specific terms used by the Buddha to refer to language are nirutti (etymology) and adhivacana (definition or semantics). Nagarjuna’s use of the term abhidheya, meaning “that which is to be designated,” (XVIII.7) would provide us with a term that he may have used if he had a need for referring to language. Such a term would be adhidyhana and would not be semantically much different from the term adhivacana used by the Buddha. However, for Nagarjuna, the abhidheya or “that which is to be designated” ceases with the cessation of cittagocara (“the object of thought”). Thus, anything that is not the object of thought, that is non-conceptual (nirvikalpa), is also not describable. If so, Nagarjuna had no reason to compose more than four hundred verses trying to explain the indescribable. It would be a fruitless attempt on the part of any philosopher, let alone one who is extolled as an “enlightened one” (buddha).

If Nagarjuna was trying to explain something and in that process was utilizing language, he would be dealing with the conceptual or the object of thought (citta-gocara). Accordingly, anything that is conceptual would also be the object of thought, and the non-conceptual (nirvikalpa) could not be an object of thought. A truth that cannot be thought of, let alone one that cannot be spoken of, would be as metaphysical as the conception of atman in the Brahanical speculations. Nirvikalpa would, therefore, mean something else. In the course of the analysis of the Karika, it was pointed out that Nagarjuna was critical of a specific form of discrimination, a discrimination that produced polarities in human thinking. These consisted of existence and non-existence, substance and quality, self-nature and other-nature, permanence and annihilation. In such a context, nirvikalpa would refer to polar discriminations, not any and every form of discrimination.

This leads us to one of the most controversial discriminations that the metaphysicians of the Buddhist tradition as well as their counterparts of other substantialist traditions made with regard to bondage and freedom. Chapter XXV of the Karika is devoted to an analysis of this metaphysical issue. In Chapter XXIV, when Nagarjuna spoke of samvrty and vyavahara on the one hand and pramartha on the other, he was paving his way for a discussion of the discrimination between bondage and freedom.

Nagarjuna, who provided every indication that he had read the early discourses, could not have been unaware that the Buddha used the terms sammuti and vohara (vyavahara) more often in the sense of moral conventions. These moral conventions pertained to good (dharma) and bad (adharma). Thus, whenever he used the term vyavahara, Nagarjuna was referring to the moral conventions of good and bad (dharmaadharma) (XXIV.36)
or merit and demerit (punya-papa) (XVII.24). These moral conventions are accepted not because they are mere conventions agreed upon by consensus but because they work. They are pragmatically grounded. They produce fruits or consequences (artha). Such conventions provide a basis for ideal conventions referred to as paramartha (“highest fruit or consequence”). Yet, to safeguard the ideal from becoming a mere ideal and not a fact, Nagarjuna insists upon the dependence of the ideal on the concrete. A quotation from William James, even though extensive, seems to be relevant here.

If the ethical philosopher were only asking after the best imaginable system of goods he would indeed have an easy task; for all demands as such are prima facie respectable, and the best simply imaginary world would be one in which every demand was gratified as soon as made. Such a world would, however, have to have a physical constitution entirely different from that of the one which we inhabit. It would need not only space, but a time, of n-dimensions, to include all the acts and experiences incompatible with one another here below, which would then go on in conjunction such as spending our money, yet growing rich; taking a holiday, yet getting ahead with our work; shooting and fishing, yet doing no hurt to the beasts; gaining no end of experience, yet keeping our youthful freshness of heart; and the like. There can be no question that such a system of things, however brought about, would be the absolutely ideal system; and that if a philosopher could create universes a priori, and provide all the mechanical conditions, that is the sort of universe which he should unhesitatingly create. But this world of ours is made on an entirely different pattern, and the casuistic question is here most tragically practical. The actually possible in this world is vastly narrower than all that is demanded; and there is always a pinch between the ideal and the actual which can only be got through by leaving part of the ideal behind. 138

In a similar way, Nagarjuna, following the pragmatic teachings of the Buddha, could not divorce paramartha from samvrti (i.e., the ultimate fruit from the fruit of everyday life of a human being). Just as much as “emptiness” is based upon “the empty,” even so paramartha had to be based upon the samvrti. Without any reference to the concrete concepts of good, any notion of ultimate or ideal good would be not only meaningless but also “fruitless” (an-artha) and terribly harmful (as proven by many such instances in the history of mankind). And Thus, for Nagarjuna, ultimate good is not one that transcends ordinary notions of good, but merely an extension of the so-called goodness recognized in everyday day life (vyavahara).

The sharp dichotomy between the ordinary notion of good and the ideal good is thus broken down. It is significant to note that when speaking of two truths Nagarjuna utilized the terms samvrti and paramartha. Yet, when he proceeded to explain their relationship, he utilized the term vyavahara, thereby establishing the synonymity of samvrti and vyavahara. The fact that Nagarjuna was not prepared to create an unbridgeable chasm between samvrti or vyavahara on the one hand and paramartha on the other is clearly expressed in his famous statement that without the former the latter is not expressed (vyavaharam anasritya paramartha na desyate, XXIV. 10).

Similarly, without understanding the ultimate fruit, freedom is not obtained (paramartham anagamya nirvanam nadhigamyate, ibid.). This would mean that freedom (nirvana) itself is not something to be sharply distinguished from samsara or ordinary human life, even though they are not identical. Freedom would not be absolute freedom that has nothing to do with human life. It is no more than the absence of certain constraints (such as greed, hatred, and confusion) in the life of a human being. It is, therefore, the life of an ordinary human being that is gradually transformed, through the cultivation of moral precepts, into one of moral perfection. This transformation (rather than transcendence) is what is implied by nirvana.

Moral Philosophy

The moral life that leads to the transformation of the human personality is dearly explained by Nagarjuna in Chapter XVII. The absolutistic interpretation of Nagarjuna’s conception of “emptiness” constrained many of his modern admirers from discussing his views regarding karma and survival, even though these were part and parcel of the Buddha’s teachings. The discussion of karma and survival in the Karika was thus considered to be “Hinayanistic,” having nothing to do with the so-called Mahayana. As such, the Buddha’s own views regarding these issues turn out to be “Hinayanistic” or, at least, were intended for those low-witted disciples who surrounded him.

Contrary to this view, our analysis of the contents of Chapter XVII, placed in the background in which Nagarjuna lived, shows that he was more positive than his modern day disciples in his treatment of karma and survival. Nagarjuna’s major endeavor in this chapter is to rescue the Buddha’s discourse on moral responsibility from the havoc created by the substantialist thinkers who assumed karma to be either substantial or performed by a substantial agent. His was not an attempt to dissolve the conception of karma in favor of an absolutistic notion of “emptiness.”

Indeed, the chapter begins with a reference to the Supreme Sage (paramarsi) whose doctrine he was about to
expound. Speaking of the morally good life, Nagarjuna uses the term dharma, instead of karma, and this may have confounded the modern interpreters. The term dharma, as explained earlier in the discussion of the Buddha’s philosophy, was used both in an ontological sense and in an ethical context. Nagarjuna himself followed this practice, as indicated in the annotation of the Karika (see XXIV. 36). Thus, in the present context too, dharma means good karma and these are identified as (i) self-restraint, and (ii) benefitting others. Nagarjuna’s selection of these two types of action as the foundation of moral behavior is significant. They are an echo of the Buddha’s own first sermon to the world that advocated a middle path between two extremes of self-indulgence and self-mortification. The “Middle Way” (madhyamika) philosopher par excellence could not have ignored the ethical middle path of the Buddha. He knew the implications of that first sermon. Self-restraint, but not self-mortification or self-immolation, constitutes one of the foundations of moral life. In this regard, Nagarjuna was not advocating the extremist form of behavior sometimes extolled as the ideal of a bodhisattva both in the Theravada and in the Mahayana, Self-restraint is a necessary prerequisite for any altruistic activity, which is the second of the virtues extolled by Nagarjuna as a “friendly way” (maitram dhrarmam).

The implications of the moral life recommended here should not go unnoticed. In spite of the exceedingly popular theme emerging among the Buddhists during Nagarjuna’s day that emphasized extreme altruism, Nagarjuna seems to be playing a rather moderate tune recognizing the Buddha’s own words in the Dhammapada (166): “One should not neglect one’s own welfare through excessive altruism. Having understood one’s own welfare, one should be devoted to true welfare.”

A reader of the early discourses cannot but be impressed by the ideal of human behavior advocated by the Buddha. The noblest person according to the Buddha is one who avoids suffering for himself as well as others (attabyabadha, parabyabadha). Thus, a noble action should be one that contributes to one’s own happiness as well as the happiness of others. This involves the recognition that, while abandoning a belief in a metaphysical self, one has to cultivate compassion for one’s own person. At the same time such compassion should be extended to others as well. Nagarjuna seems to have picked up this theme well when, unlike many Buddhist writers of his day, he emphasised that self-restraint and benefitting others are both acts of friendliness (maitram). He was simply insisting: “Be a friend to yourself and be a friend to others.” This would certainly be opposed to the ideal that calls for complete and unqualified self-sacrifice, including self-immolation. Thus Nagarjuna, the founder of the “Middle Way” (Madhyamika) school, could not have recommended a more sober moral life than one which avoids the two extremes of destroying oneself and destroying others.

These two friendly ways are recommended by Nagarjuna because they are fruitful not only in the present life (iha) but also in an after-life (pretya). There could be no doubt that he was recognizing the possibility of human survival. The samsara or “life-process” referred to at XXIV. 10 need not be confined to this present life alone. On the contrary, it refers to the continuity of the life-process through several births and deaths, referred to as punabbhava in the early discourses. That continuity, along with its attendant suffering, is to be eliminated by the development of wisdom (jnana) which for Nagarjuna consists in the avoidance of all metaphysical views (drsti).

Knowledge Leading To Freedom

Knowledge that leads to freedom is not omniscience (sarvajnata). Nowhere in the Karika does Nagarjuna refer to omniscience, even though it was a popular theme among the Theravadins and the Mahayanists. In the absence of omniscience, what form of knowledge could lead man from bondage to freedom? Nagarjuna refers to “a wise one” (vidvan) who, through his perception of the nature of truth (tattva-darsanat), does not accumulate dispositions (samskara) that lead to wandering (samsara) (XXVI.10). Thus, for Nagarjuna, as it was with the Buddha, the problem lies in the accumulation and pursuit of one’s dispositions. Yet without following the dispositions a human being is unable to deal with the rather complex and excessive sensory input. The “big blooming buzzing confusion” of experience has to be faced without the aid of omniscience. The task is rendered extremely difficult because the dispositional tendencies that are a necessary means of dealing with such experience also lead to extremes, especially when these dispositions are dominated by one’s likes and dislikes. When they are dominated by likes and dislikes, they produce perspectives on the basis of which one looks at the world, two of these being eternalism and annihilationism. In order to adopt a middle path avoiding these two extremes, one needs to eliminate the likes and dislikes and thereby appease one’s dispositions. A person who has achieved the state of the appeasement of dispositions (samskaropasama) (and this would include the appeasement of the object of perception (drastavyopasama), whether that object be the cogito or the real external world) is said to have attained enlightenment and freedom. Such a person is enlightened because he comes to perceive things as they have come to be (yathabhatajana = tattvadarsana), and he is free.
because he does not adhere to any dogmatic view that rules out other possibilities. The difference between a metaphysical view criticized by the Buddha as well as Nagarjuna and the “middle position” (madhyamapratipat) accepted by both is that the former is a closed view while the latter is an open one. An open view does not subscribe to an absolute discrimination as either/or. The very idea of openness implies non-grasping (anupadana). Thus, when both the Buddha and Nagarjuna emphasized the renunciation of all views (sarva-dṛsti-prahāna), they were insisting upon abandoning all forms of dogmatism with regard to views. For them, non-attachment to views does not necessarily mean having “no-views.”

Inappropriate rendering of Sanskrit terms into English seems to have contributed in some measure toward the myth that Nagarjuna had no view to express. The passage often quoted in support of this myth occurs in Nagarjuna’s Vigrahavyavartani (29): “If I would make any commitment whatever, from that I would incur such error. On the contrary, I do not have a commitment. Therefore, there is no error on my part.”

The term that occurs here is pratijña, which has been translated as a simple proposition or statement. It is much more than a simple proposition or statement. It is a commitment and should be contrasted with vyakhyāna, “explanation,” (IV.9). While avoiding the former, Nagarjuna continued to resort to the latter (see also XVII.13, etc.). As such, it would be highly inappropriate to compare Nagarjuna’s philosophical method with that of Ludwig Wittgenstein, for example by quoting him as follows: “Philosophy simply puts everything before us, and neither explains nor deduces anything. Since everything lies open to view, there is nothing to explain.” In fact, this quotation misrepresents Wittgenstein’s own approach to metaphysics. The most important part of the statement has been omitted. It reads: “For what is hidden, for example, is of no interest to us.” If this crucial statement is retained, then Wittgenstein’s thought can certainly be compared with Nagarjuna’s or even the Buddha’s. This omitted part of the statement makes it abundantly clear that what Wittgenstein was not willing to explain is “what is hidden,” and this “something” is, indeed, comparable to what Nagarjuna was referring to as kimcit or kascit, that is, the hidden substance in phenomena. Neither “the empty” (sunya) nor “emptiness” (sunyata), neither “the dependently arisen” (pratītyasamutpanna) nor “dependent arising” (pratītyasamutpada) represent a hidden something which Nagarjuna was reluctant to explain. On the contrary, if it can be shown that Wittgenstein did not provide any explanation of experience, or did not attempt to formulate in linguistic terms what a true experience is, as opposed to a confused one, then he could certainly be enlightened by the language of “emptiness” or of “dependence” adopted by the Buddha and Nagarjuna.
Abbreviations

References to works in verse give the number of the chapter and verse or half-verse (e.g., MMK 24:18, RĀ 1:49a), apart from works not usually subdivided into chapters, such as the YS., ŚŚ, VV, and VP, where only the number of the verse is given. References to works in prose give the page and line of the editions cited below (e.g. VV(S) 82:3–7).

1 Introduction

The following pages contain an investigation of Nāgārjuna’s philosophy from a systematic perspective. Considering Nāgārjuna’s important place in Buddhist philosophy as well as in Indian thought more generally, it is not surprising that his works have given rise to an enormous number of commentaries, studies, and analyses in Asia, and, more recently, also in the West. A large amount of these take the form of commentaries on specific texts, following their structure and analyzing individual passages in considerable detail. While the importance and usefulness of such commentaries is beyond dispute, the present work sets out to approach Nāgārjuna’s philosophy from a different perspective. The idea is to present a synoptic overview of Nāgārjuna’s arguments concerning different philosophical problems in order to present an account of the whole of his philosophy, showing how its individual parts fit together as elements of a single philosophical project. In order to achieve this goal, it is not sufficient to give a mere paraphrase of Nāgārjuna’s arguments (as is frequently found in the secondary literature). We will have to analyze their philosophical contents, examine actual as well as possible objections, determine whether the arguments can in fact be made to work, and, if so, what kind of philosophical conclusion they support. Comparatively little work has been done in this direction. Since a great part of the contemporary Western studies of Nāgārjuna are interested primarily in philological, historical, or religious aspects of his works, genuinely philosophical studies have been rare. The aim of the present study is to help close this gap.
The following pages should be of interest both to philosophers looking for a systematic account of Nāgārjuna’s philosophical position, and to Indologists and scholars of Buddhist studies interested primarily in the philosophical aspects of Nāgārjuna’s works. To make this material as accessible as possible to readers with little or no background in Indian philosophy, I generally use English equivalents of technical Indian philosophical terms (such as “object” for dharma, “emptiness” for śūnyatā, “primary existence” for dravyasat, and so forth), providing the Sanskrit term in brackets if necessary. The only case where I have systematically violated this policy concerns the term svabhāva. My reason is that there is no single term used in Western philosophy that covers the different aspects of its meaning in the Madhyamaka context in a satisfactory manner. But given that all of chapter 2 is dedicated to a discussion of how we are to understand the notion of svabhāva, the reader should have a sufficiently clear conception of its meaning when encountering it again in later chapters. For the benefit of Indologists and Buddhist scholars, the Sanskrit and Tibetan (and occasional Pali) of all quotations is given in the footnotes. Some material and references in the footnotes will be particularly relevant to philosophers, some are of more historical or philological interest. I have made no attempt to differentiate the “philosophical” and “Indological” footnotes but trust in the reader’s discernment to find the material that interests him.

Different kinds of readers might prefer different routes through the material presented here. Those interested in a step-by-step introduction to Nāgārjuna’s philosophy should read the chapters in numerical order. Readers with previous acquaintance with Madhyamaka material who are interested in what I have to say on a particular Nāgārjunian topic will prefer to go directly to the relevant chapter. For those wanting to get straight at the philosophical content, I recommend finishing the introduction, followed by chapter 2, then immediately jumping to chapter 10. Then it is possible to dip into any of chapters 3 to 9 for more specific discussion of topics one finds interesting.

1. Nāgārjuna the Philosopher

Nāgārjuna, one of the greatest thinkers in the history of Asian philosophy, remains an enigma. Despite the existence of various legendary accounts of his life passed down in Buddhist literature, \(^1\) contemporary scholars agree on hardly any details concerning him. It is unclear when he lived (although some time

\(^1\) Walleser (1923): Dowman (1985). during the first three centuries a.d. is most likely).\(^2\) where he worked (almost all places in India have been suggested),\(^3\) what he wrote (the Tibetan canon attributes 116 different texts of very diverse content and quality to him), and even how many Nāgārjunas there were in the first place (up to four different ones have been distinguished).\(^4\)

Recent research by Joseph Walser suggests that Nāgārjuna may have written the Ratnāvali sometime between 170 and 200 a.d. in the area around present-day Amarāvati.\(^5\) This conclusion is based on two facts. First, there is a variety of evidence connecting Nāgārjuna with the Sātavāhana dynasty.\(^6\) This is not very helpful on its own, since this dynasty spanned several centuries. However, in verse 32 of the Ratnāvali, Nāgārjuna mentions a depiction of the Buddha sitting on a lotus (padmapīṭha). Given that such images were available only during the late part of the dynasty in the Eastern Deccan, Walser comes to the tentative conclusion that Nāgārjuna composed the text during the reign of king Yajña Śri Sātakarni (about 175 to 204 a.d.).\(^7\) Of course none of this can be regarded as hard evidence, especially as the necessary detour via art history (in order to find the earliest date for the type of depictions of the Buddha Nāgārjuna describes) introduces a whole new range of complexities and uncertainties. Nevertheless, given our present inability to find out the time and place of Nāgārjuna in any other way, determining them approximately on the basis of a variety of historical data such as suggested by Walser is surely to be preferred to not determining them at all.

1.2. Nāgārjuna’s Works

Assuming we resolve the uncertainty about Nāgārjuna’s time and place by locating him in the second century a.d. in the Eastern Deccan, how do we deal with the multitude of works ascribed to him? This investigation will be based primarily on six of Nāgārjuna’s works:

1. The “Fundamental Verses on the Middle Way” (MūlaMadhyamakakārikā, MMK)
2. The “Sixty Stanzas on Reasoning” (Yuktisāṣṭikā, YS.)

\(^3\) The most common view distinguishes only three Nāgārjunas: the Madhyamaka philosopher, the tantric adept, who possibly flourished around 400 a.d. (Lindner 1982: 11, n. 12), and the alchemist, who might be placed in the seventh century (Walser 2005: 69, 75–79, (Eliade 1969: 415–416). For criticism of the thesis of multiple Nāgārjunas see Hua (1970).

\(^4\) Walser (2005: 61).

\(^5\) Walser (2005: 293, n. 26).

3. The “Seventy Stanzas on Emptiness” (Śūnyatāsaptati, SS)

4. The “Dispeller of Objections” (Vigrahavāvartanī, VV)

5. The “Treatise on Pulverization” (Vaidalyapraṇarāṇa, VP)

6. The “Precious Garland” (Ratnāvalī, RĀ)

This set, the so-called Yukti-corpus, is well known in the Tibetan tradition, where it is called the “collection of the six texts on reasoning” (rigs pa’i tshogs drug). We cannot be certain that all six texts were indeed composed by Nāgārjuna; apart from the MMK, where Nāgārjuna’s authorship is taken to be true by definition, the attribution of every other one has been questioned. However, apart from the fact that all these texts were attributed to Nāgārjuna by a variety of Indian and Tibetan Madhyamaka authors, they also expound a single, coherent philosophical system. For the purposes of this discussion we will therefore identify Nāgārjuna with the author of the Yukti-corpus.

1.3. Methodological Considerations

The six texts under consideration are all written in verse. In some cases they are accompanied by an autocommentary in prose, though the status of these autocommentaries is not always unproblematic. Since this inquiry is intended to be a study of Nāgārjuna’s Madhyamaka, the texts of the Yukti-corpus constitute the basis of our discussion. It is nevertheless not possible to provide a philosophically satisfactory exposition of Nāgārjuna’s thought based exclusively on these texts. This is because their versified form often leads to a very condensed expression of arguments which requires a variety of details to be filled in. In itself this is hardly surprising given that Indian philosophical texts (unlike their Western counterparts) were generally not intended to provide the reader with a self-contained exposition of the author’s thoughts. Instead their versified form provided the structure of the argument to be memorized, which would then be elaborated on by written commentaries and by a teacher’s oral explanations. The reader of Nāgārjuna’s works will frequently encounter passages in which Nāgārjuna asserts that a certain position is deficient and ought not to be accepted, without giving the reason why this is the case. In order to give an assessment of the philosophical argument presented, such gaps have to be closed. Sometimes this can be done in a straightforward manner by consideration of other passages in Nāgārjuna’s works where similar issues are discussed. In other cases matters are more difficult. Occasionally Nāgārjuna’s extant works do not provide information about how a certain argument is to be understood, and so we face an important methodological issue. How do we justify ascribing a certain argument to Nāgārjuna if there is no evidence of such an argument being made in his works that have come down to us? The commentarial literature is of great help in dealing with this issue. We find a long and voluminous tradition of commentaries on Nāgārjuna’s works in India, Tibet, and China spanning nearly two millennia. These commentaries often unpack the complexity of Nāgārjuna’s compact verses by adding invaluable information about terminology, philosophical content, and alternative interpretations. So even though all of Nāgārjuna’s own texts might be silent on how to spell out a particular argument, commentaries will often provide us with information in this regard. Since these are part of a long argumentative tradition of considerable sophistication, some of which arose in relatively close proximity to Nāgārjuna’s own intellectual context, they should be taken very seriously when interpreting his thoughts. Our first methodological maxim when “filling in” the missing parts of Nāgārjuna’s arguments should therefore be to attempt consistency with the commentarial tradition.

The situation we are faced with might be compared to that of a restorer who wants to reconstruct parts of a painting that have been destroyed. In order to determine how to fill in the missing bits, he will do well to consider descriptions of the painting from the time when it was still intact, as well as copies, sketches, and drawings by other artists which have been based on the work in question. The restorer will then have a good idea of what might have been depicted on the missing piece of the canvas and can go about reconstructing it. A difficulty we face is that while Nāgārjuna’s works sometimes give not enough information, the commentarial tradition often presents us with more than we want. Like traditions in general, that of commentaries on Nāgārjuna does not speak with one voice. Some of the more obscure passages are read in so many different ways that we might despair about ever being able to come up with a faithful reconstruction of Nāgārjuna’s arguments.

Suppose one of the sources the restorer consults tells him that the missing lower left corner of the painting depicted a dog, another says that it depicted
a wolf, and a sketch shows a peacock in that same place. He might now try to rule out some of these variant interpretations on stylistic or iconographical grounds, but the conclusion arrived at must necessarily be highly conjectural. Fortunately, the restorer of philosophical arguments is in a slightly better position, because the parts of a philosophical text hang together in a way that the parts of a painting do not, since they form part of a coherent philosophical argument and express a unified philosophical position. At least this is what we have to assume if we want to adopt a charitable interpretation of the texts in question. Doing so seems to be a precondition for accomplishing any kind of philosophical reconstruction at all. It of course does not imply that we assume the author is always right, but rather that we read his texts in a way that maximizes the rationality of the material. We might in the end find flaws in the argument or have other reasons for rejecting the conclusions, but doing so presupposes assuming that arguments and conclusion are to be found there in the first place.

Based on the necessity of providing a charitable interpretation, we can therefore use a second methodological maxim, namely to reconstruct an argument in the philosophically most successful way. Faced with a variety of interpretations in the commentarial literature, we can systematically select those that make most sense in presenting Nāgārjuna’s philosophy as a systematic whole, as an intellectual enterprise whose parts fit together to present a unified philosophical theory.

Of course the extent to which the following discussion satisfies the above maxims may be disputed: different views on what the commentarial literature says and on which kinds of arguments are more successful do exist, and it is useful to compare these to gain a good grasp of the purpose of Nāgārjuna’s arguments. What I hope will be clear, however, is that the interpretation of Nāgārjuna’s thought presented here is not arbitrary but has been arrived at in an attempt to find the best balance between the two maxims of doctrinal coherence and systematic success.

Although the presentation of Nāgārjuna’s philosophical positions given here, unlike that found in some contemporary literature, is very much in accordance with the mainstream of Indian and Tibetan commentarial literature, its main aim is not to present a historical description of Nāgārjuna’s views but rather to present Nāgārjuna’s thought in a way that brings out its systematic appeal. There is a tendency in some parts of Buddhist studies to undersell Nāgārjuna’s thoughts by giving a purely descriptive and paraphrasing account of his arguments, which frequently falls short on philosophical sophistication. The present work is intended to redress the balance to some extent by showing the importance and impact of Nāgārjuna’s thoughts as philosophy.

1.4. The Philosophical Study of Nāgārjuna in the West

Western interest in Nāgārjuna as a philosopher is a comparatively recent phenomenon, going back little more than a century. In itself this attention constitutes only a part of Nāgārjunian scholarship, a substantial portion of which concerns itself with problems of philology, textual history, or the study of religion. A concise overview of the specifically philosophical investigation of Nāgārjuna in the West has been presented by Andrew Tuck. Tuck argues that its history can be divided into three phases, corresponding to three Western philosophical frameworks against which Nāgārjuna used to be interpreted. First is the Kantian phase, then the analytic phase, and finally a post-Wittgensteinian one. A clear example from the first phase is Theodore Stcherbatsky’s The Conception of Buddhist Nirvāṇa, which was first published in 1927. Stcherbatsky interprets Nāgārjuna as dividing the world into appearance and reality, the former corresponding to samsāra, the realm of cyclic existence, the latter to nirvāṇa, liberation. In his attempt to defend Nāgārjuna against the charge of nihilism, especially clear in the exposition given by La Vallée Poussin, Stcherbatsky ascribes to Nāgārjuna the assumption of an absolute noumenal reality which underlies the constantly changing and ephemeral world of phenomena.

The further development of this Kantianization of Nāgārjuna is presented in what is still a basic text of Buddhist studies, T. R. V. Murti’s 1955 The Central Philosophy of Buddhism. Since Murti’s exposition of Nāgārjuna is considerably more detailed than Stcherbatsky’s, the fundamental difficulties of interpreting Nāgārjuna according to a Kantian framework become more readily apparent. Murti observes that “the relation between the two [i.e., the Absolute and the

12. For the notion of the “principle of charity” see Davidson (1973).
world of phenomena] is not made abundantly clear. This may be said to constitute a drawback in the Mādhyamika conception of the Absolute.” On the other hand, we might want to argue that the reason for this “drawback” is a defect not in the Madhyamaka position but in the choice of interpretative framework. To conceive of Nāgārjuna’s Madhyamaka as a theory whereby an indescribable Absolute grounds the world of appearances means reading assumptions into it that Nāgārjuna does not share, thereby resulting in an unsatisfactory theory. The second, analytic phase of Western studies of Nāgārjuna can be regarded as starting shortly after the publication of Murti’s book, with Richard Robinson’s 1957 article “Some Logical Aspects of Nāgārjuna’s System.” Robinson sets out to analyze some of Nāgārjuna’s arguments using the resources of modern symbolic logic, the ultimate aim being “to transcribe the Kārikās entirely, chapter by chapter, into logical notation, thus bringing to light formal features which do not appear from the consideration of examples taken out of context and listed topically.” The shift from the Kantian to the analytic reading of Nāgārjuna which Robinson’s paper inaugurates brings with it a shift in the aspects of his thought receiving most attention. The focus is shifted from an investigation of the primarily metaphysical problem of the relation between samsāra and nirvāṇa to the logical aspects of Nāgārjuna’s thought: his use of quantification and negation as well as the mechanics of the notorious form of argument known as the “tetralemma” (catuṣkoṭi).

If one considers the bigger picture, however, once again the limitations of the reading of Nāgārjuna during the analytical phase become apparent. Many of his views, concerning, for example, the rejection of a foundationalist ontology or the difficulties of assuming a world conforming to the structure of the language we use to refer to it, contradict assumptions of analytic philosophy of the first half of the twentieth century. While the employment of certain tools that are dear to analytic philosophers could be seen as presenting Nāgārjuna’s arguments more clearly, it was also evident that Nāgārjuna would have had little regard for many of the goals aimed at by analytic philosophers. Neither the attempt to develop a logically perfect language for describing the world nor to ground our knowledge of the world on the supposedly secure foundation of sense-data could find much favor with Mādhyamikas. Analytic philosophy with its specific set of philosophical assumptions was helpful in trying to understand Nāgārjuna, but only up to a point.

In fact by a rather curious turn in the third, post-Wittgensteinian phase of interpreting Nāgārjuna, the paragons of analytic philosophy were now identified with Nāgārjuna’s opponents, such as the Ābhidharmikas and Naiyāyikas. Works such as Frederick Streng’s Emptiness or Chris Gudmunsen’s Wittgenstein and Buddhism set out to stress similarities between Nāgārjuna and in particular the later Wittgenstein and his criticism of analytic philosophy. Whereas the relation between samsāra and nirvāṇa had been the chief concern for the Kantian readers of Nāgārjuna, and that of the logical consistency of svabhāva or substance for analytic interpreters such as Robinson, the new key term of the post-Wittgensteinian phase was pratītyasamutpāda or dependent origination. This was regarded primarily as reflecting the underlying idea of a Wittgensteinian philosophy of language according to which language, and in particular the language of philosophical statements, could not be regarded as independent of the interrelated nature of conceptual thought and conventional language. Words were not supposed to gain their meaning by referring to something outside the system of language; the relation of words to their referents is not seen as being indicative of ontological status but is solely of practical value.

Looking at the way in which the Western study of Nāgārjuna was influenced by the philosophical fashions of the day, we may be worried that work following the post-Wittgensteinian phase will later appear to be a similar example of trying to shoehorn Nāgārjuna’s thought into a fundamentally alien framework. While it is certainly not possible (nor indeed desirable) to proceed with this investigation and leave behind our specific interests, expectations, and concerns, there is no reason to panic. The fact that each interpretation takes place against a specific conceptual framework does not mean that successive interpretations might not lead to a deeper and more comprehensive understanding of Nāgārjuna’s thought. In fact the literature published over the last decades suggests that the study of Nāgārjuna is becoming more mature. First of all most authors now try to treat his writings as expressing a single, unified system of thought rather than as a quarry of cryptical verses from which individual isolated samples can be extracted to suit one’s idiosyncratic

interpretation. There finally appears to be an agreement that any interpretation of Nāgārjuna should cohere with his assertions in all the works that can be plausibly ascribed to him. Second, and more important, it has become evident that Nāgārjuna is worthy of philosophical investigation in his own right. There is no more need to legitimate a study by setting out to show him to be a proto-Kant, proto-Wittgenstein, or proto-Derrida. While such comparisons may be of hermeneutic use for those acquainted primarily with the Western tradition, most writers on the topic now agree that it is no more necessary to put on a Kantian lens to understand Nāgārjuna than it is to wear a Nāgārjunian lens to understand Kant. Therefore, even though we cannot interpret Nāgārjuna free of the preconceptions and concerns of our own time, we are justified in expecting that the more mature study of his works will provide us with more accurate and stable knowledge of his philosophy than was previously possible.

1.5. Overview

Even a casual acquaintance with Madhyamaka literature makes it evident that the central philosophical concept discussed is that of emptiness (śūnyatā). The main difficulty in explaining what this concept means is that it is a purely negative one: emptiness is the emptiness of something and indicates that something is not there. This absent something is what the Madhyamaka authors refer to by the term svabhāva, sometimes translated as “inherent existence” or “own being.” For this reason the term “emptiness” is often glossed as “empty of inherent existence” (svabhāvaśūnya). A good way of understanding the Madhyamaka notion of emptiness is therefore to provide a clear conception of what is meant by svabhāva. This is what chapter 2 sets out to do.

Even if we restrict ourselves to Nāgārjuna’s Madhyamaka, svabhāva turns out to be a very complex concept. It unifies two very different aspects, an ontological and a cognitive one. The ontological aspect of svabhāva is the one discussed in most detail in the contemporary commentarial literature. The basic idea here is that an object has svabhāva if it possesses its nature in an intrinsic manner. In order to spell out this still rather imprecise idea, we have to differentiate three distinct ontological understandings of svabhāva, all of which play some role in Nāgārjuna’s arguments. The first is the understanding of svabhāva as essence, as a property that an object cannot lose without ceasing to be that very thing; the second an understanding as substance, as something that does not depend on anything else; and the third is what I have called absolute svabhāva, as a property that is regarded as the true or final nature of things.

Even though I argue that understanding svabhāva as substance occupies the most important place in Nāgārjuna’s arguments, one would be ill advised to regard it simply as some variant of the concept of substance found in the Western philosophical tradition. This is so because svabhāva has an important additional cognitive component which is completely absent from the concept of substance as it is usually conceived. The notion of svabhāva is regarded as a conceptual superimposition, as something that is automatically projected onto a world of objects that actually lack it. Unlike the notion of substance, svabhāva is not just a theoretical concept of ontology but rather a cognitive default, an addition that the mind unwittingly makes when trying to make sense of the world. This cognitive understanding of svabhāva makes clear why Madhyamaka metaphysics (unlike metaphysics in the Western tradition) is not a purely theoretical enterprise but something that also has to be put into practice. If svabhāva is an automatic mistaken superimposition, we cannot just get rid of it by going through arguments attempting to show that svabhāva does not exist. We will also have to train ourselves out of the automatic habit of projecting svabhāva onto a world that lacks it. This point can be illustrated by considering two different ways of studying higher-dimensional geometry. It is, for example, possible to prove various facts about a four-dimensional cube without having any idea of what such a cube would look like. We simply regard it as a theoretical entity which is defined in a certain way, and then proceed to prove further facts on the basis of this definition. On the other hand, we could also try to develop a spatial intuition for the fourth dimension, that is, try to get an idea of what such a cube would look like. We could, for example, imagine the ways in which a two-dimensional creature living on a plane could form the conception of a cube by extrapolating from a square and similarly try to extrapolate a four-dimensional cube from a three-dimensional one. It is evident that this latter attempt at enlarging our spatial intuition is not just about proving theorems, but requires certain exercises for enlarging our imagination.28 In the same way, for the Madhyamaka the removal of the superimposition of svabhāva is not just about working through philosophical arguments, but also requires certain exercises to effect a cognitive shift which keeps the mistaken projection of svabhāva from occurring.

A great part of Nāgārjuna’s writings consists of the investigation of individual phenomena in order to argue that they do not exist with svabhāva. Before we can turn to the examination of these arguments, however, it is necessary to deal first with some formal aspects of Nāgārjuna’s arguments. I call these

28. The Victorian mathematician Charles Howard Hinton spent considerable time developing such exercises. See, e.g., Hinton (1904).
aspects “formal” because they all have to do with negation, which is generally regarded as a formal notion. Nevertheless this adjective is also somewhat misleading if one regards as “formal” those aspects of an argument that are independent of its content. For in the discussion of Nāgārjuna the point is precisely that there are certain presuppositions made by the traditional Indian theory of negation which conflict with the contents of his philosophical conclusions. In order to formulate his philosophy, Nāgārjuna must therefore come up with an adapted conception of negation which counters these presuppositions. The main difficulty involved here (which is addressed in chapter 3) is the assumption of the Naiyāyikas, who elaborated the standard Indian account of negation, that the constituents of negative statements must always refer to real entities. A statement such as “there is no pot” is always to be understood along the lines of “there is no pot at a particular place.” In this case both the pot and the place exist, it is only that the former does not occur at the latter. But Nāgārjuna obviously cannot interpret his statement “there is no svabhāva” along these lines, because he does not want to assert that svabhāva is a real entity existing anywhere else.

The second important formal issue, taken up in chapter 4, is the well-known catuṣkoṭi or tetralemma. This is a rather puzzling form of argument, frequently employed by Nāgārjuna, which consists of the rejection of four positions: a statement, its negation, their conjunction, and their disjunction. An important prerequisite for making sense of the tetralemma is to realize that the various negations occurring in it are not all of the same type. Some are implicational negations (paryudāsa), which make an assertion about the object referred to (“the apple is not red” implies that it is some other color), while others are nonimplicational (prasajyapratīśedha) and do not make such an assertion (“the force of gravity is not red” does not imply that it is some other color). Once the interrelations between these two kinds of negation have been taken into account, it becomes clear that Nāgārjuna uses this form of argument in order to reject all the possible alternative statements one can make about an entity on the assumption that it exists with svabhāva. If all these alternatives turn out to be inapplicable, we can conclude that the initial assumption was wrong and that there is no svabhāva to be found in that entity.

Having examined these formal aspects of Nāgārjuna’s arguments (which are intricately connected with the contents of his philosophy) and taking into account the clarification of the different aspects of the notion of svabhāva, the reader will be able to understand Nāgārjuna’s discussions of the emptiness of specific kinds of phenomena without too much difficulty. Chapters 5 to 9 deal with the main topics Nāgārjuna analyzes in order to demonstrate their emptiness, that is, lack of svabhāva. All of these play a major part in our cognitive interaction with the world and therefore constitute areas where we are particularly likely to mistakenly superimpose the existence of svabhāva on phenomena that in fact lack it. Chapter 5 deals with the central notion of causation. Nāgārjuna’s analysis concentrates on two aspects: that of the identity or difference between cause and effect, and that of their temporal relation. Each can be spelled out in different ways. We can assume that cause and effect are fundamentally the same thing, or that they are different, or that they are related as part and whole. Similarly, the cause can be regarded as preceding the effect, as following it, or as being simultaneous with it. By rejecting all these different ways of conceiving of cause and effect, Nāgārjuna attempts to demonstrate that our underlying assumptions about causation are deficient. Causation is not a mind-independent, objective relation which connects objects “which are there anyway.” It is rather something that would not exist without a substantial mental contribution; it is a conceptually constructed relation which would not exist without the conceptualizing mind. This also entails that the objects connected by such a relation cannot exist in a mind-independent way since their existential dependence on a cause holds via a relation that is not itself mind-independent.

Chapter 6 deals with the concept of motion. This might strike one as hardly as central a notion as those discussed in the other chapters. We do, however, have to take into account that according to the Indian worldview motion is something that characterizes not just billiard balls, chariots, or the planets but also the person moving through successive rounds of rebirth. It is therefore essential to keep in mind that when Nāgārjuna speaks of a “mover,” this can refer to a person crossing the street as well as to one crossing from this life to the next. To this extent this discussion is also connected with that of a person, which will be discussed in chapter 7.

On one level Nāgārjuna’s arguments attempt to establish the absence of an objective, mind-independent existence of the spatiotemporal location of motion. But in fact his conclusions are more far-reaching than that. When discussing the relation between mover and motion, he regards his arguments as a template which can be employed in a variety of contexts. Motion constitutes an important illustration of Nāgārjuna’s point, but his exposition is not confined to it. The point to be illustrated is concerned with the relation between individuals and the properties they instantiate. Nāgārjuna uses the example of motion to argue that the standard analysis of phenomena into independently existent individuals and properties (as encountered, for example, in the Nyāya- Vaiśeṣika theory of dravya and guṇa) is deficient and should be rejected. It is to be replaced by a view that regards individuals and properties as linguistically or conceptually mediated projections of at best pragmatic importance, but not as objective features of a mind-independent reality.
In the examination of the self considered in chapter 7 Nāgārjuna moves from the investigation of outer phenomena, such as causation or motion, to the most important example of a subjective entity. Following Buddhist tradition, Nāgārjuna rejects the view of a substance-self, an essentially unchanging unifier of our mental life distinct from our body on the one hand and our psychological states on the other, a self that is an agent whose decisions shape our life. Apart from the familiar investigation into the relation of a substance-self and its parts well known from Buddhist literature, Nāgārjuna also seeks to refute the substance-self by a different type of argument. This concerns the worry of the opponent that if there are properties of the self, there also must be a self which is the bearer of such properties. Given Nāgārjuna’s theory of individuals and properties, there is, however, no necessity to draw this conclusion. Individuals and properties are seen as linguistic or conceptual artifacts rather than as fundamental constituents of reality which exist in dependence on one another. Accepting that there are properties of the self does not force us to accept the existence of a substance (dravya) as their bearer on which they depend for their existence. The conception of self emerging as an alternative is that of a process-self, something that is a sequence of physical and psychological events but mistakenly assumes that it is no such sequence, but a substance-self. As in the case of emptiness of objects, where the superimposition of svabhāva on phenomena had to be overcome, correcting the mistaken self-awareness of the process-self cannot be based solely on working through arguments demonstrating the nonexistence of the substance-self, that is, a self existing with svabhāva. Since viewing itself as a substance-self is the self’s cognitive default, establishing a correct self-awareness can be achieved only by continuous practice.

The self and the world are connected in the theory of knowledge, which is the topic of chapter 8. For Nāgārjuna the discussion of epistemology entails examining yet another kind of phenomenon for existence by svabhāva (by investigating whether the means we employ to acquire knowledge of objects are intrinsically such means, and whether the objects are intrinsically such objects) as well as establishing an epistemological framework to explain how emptiness can be known. In this discussion Nāgārjuna’s intellectual interaction with the Naiyāyikas is particularly pronounced. They provide the source of the idea that means and objects of knowledge can be established “from their own side,” a view that Nāgārjuna understandably rejects. He concentrates on an examination of the different ways in which we could find out that particular putative means of knowledge are indeed such means. The idea that these means are in some way self-established and the idea that the means and objects of knowledge mutually establish one another are both rejected by Nāgārjuna. His aim is to show that there are no epistemic procedures that are intrinsically and essentially means of knowledge and that their objects are not independently existing reals. Essentialism about epistemic procedures is thus replaced by contextualism: procedures can give us knowledge in some contexts, but not in others, without ceasing to be means of knowledge. This turns out to be exactly the epistemology the proponent of emptiness needs. For if everything is empty, there is obviously nothing that is a means of knowledge intrinsically, by svabhāva. But if that means that there are no means of knowledge at all, then the problem is that emptiness could not be known, contrary to Nāgārjuna’s assertion. It is therefore essential to come up with an account of epistemology like the contextualist one, which allows for means of knowledge but does not assume that they exist intrinsically.

A philosophical system which is concerned as much with the way in which our conceptual and linguistic conventions shape our view of the world as Madhyamaka is will have something to say on the philosophy of language. Somewhat surprisingly, discussions of language do not occupy a great part of Nāgārjuna’s writings. The greatest part of the Madhyamaka philosophy of language is a later development. Nevertheless it is possible to extract some of Nāgārjuna’s views on the more important issues in this area from the extant sources. This is the subject matter of chapter 9. A central and well-known assertion in this context is Nāgārjuna’s pronouncement that he (and, we may conclude, the Mādhyamika in general) does not hold a thesis or position. The commentarial tradition has supplied a variety of ways of understanding this statement. I want to argue that the most coherent reading in the context of Nāgārjuna’s philosophy as a whole is to understand it as a semantic pronouncement. What Nāgārjuna means when he says that he has no thesis is that he has no thesis that should be interpreted by a particular semantic theory. This theory, which I call the “standard picture,” assumes that the world of referents is endowed with a mind-independent structure and that our language manages to latch onto the world not just by force of convention, but by the existence of some objectively existent structural similarity between language and world. Both of these assumptions, that of a “ready-made” world and that of an objective reference relation, are incompatible with Nāgārjuna’s theory of emptiness, since each would entail the existence of entities with svabhāva. Once again the interconnectedness of Nāgārjuna’s philosophy becomes evident. The doctrine of emptiness, which arises primarily in the context of a metaphysical and cognitive discussion, demands an adaptation not only of the standard view of epistemology but also of the standard view of semantics. Ultimately the Mādhyamika will have to explain both the structuring of the world and the reference relation in terms of conventions and speaker intentions in order to avoid reintroducing the notion of svabhāva by the back door.
The aim of chapter 10 is not just to bring all the parts of the discussion together, but to step back from the texts to assess Nāgārjuna’s thought systematically. The objective is both to examine the plausibility of Nāgārjuna’s conclusions and to establish that his philosophy is not a disparate collection of arguments but rather a coherent philosophical project whose different components are interconnected in intricate ways. In some instances I also set out to relate Nāgārjuna’s conclusions to the contemporary discussion of the matters he deals with. Here my aim is not so much what is sometimes called “comparative philosophy” but rather an investigation of the question which aspects of contemporary philosophy might be of interest to one aiming to enlarge Nāgārjuna’s Madhyamaka from a theory of purely historical interest to a philosophical system with systematic appeal. The chapter is divided into sections dealing with the main problems Madhyamaka thinking investigates: metaphysics, personal identity, epistemology, and language and truth. I have also added a section on ethics, a topic which Nāgārjuna treats at length but which, I argue, he discusses with less emphasis on problems arising from a specifically Madhyamika point of view than would justify a longer treatment in the context of the present investigation.

2 Interpretations of Svabhāva

The notion of svabhāva provides the central conceptual point around which the greatest part of Nāgārjuna’s Madhyamaka revolves. Although it is never used in the sūtras and is rare in the Pali canon, the term svabhāva, often translated as “inherent existence” or “own-being,” acquired a dominating role in the thought of the Madhyamika. Despite its centrality, its status is fundamentally negative: one, if not Mādhyamika. Despite dominating role in the thought of the Madhyamaka from a theory of purely historical interest to a philosophical system with systematic appeal. The aim of chapter 10 is not just to bring all the parts of the discussion together, but to step back from the texts to assess Nāgārjuna’s thought systematically. The objective is both to examine the plausibility of Nāgārjuna’s conclusions and to establish that his philosophy is not a disparate collection of arguments but rather a coherent philosophical project whose different components are interconnected in intricate ways. In some instances I also set out to relate Nāgārjuna’s conclusions to the contemporary discussion of the matters he deals with. Here my aim is not so much what is sometimes called “comparative philosophy” but rather an investigation of the question which aspects of contemporary philosophy might be of interest to one aiming to enlarge Nāgārjuna’s Madhyamaka from a theory of purely historical interest to a philosophical system with systematic appeal. The chapter is divided into sections dealing with the main problems Madhyamaka thinking investigates: metaphysics, personal identity, epistemology, and language and truth. I have also added a section on ethics, a topic which Nāgārjuna treats at length but which, I argue, he discusses with less emphasis on problems arising from a specifically Madhyamika point of view than would justify a longer treatment in the context of the present investigation.

2.1. The Ontological Dimension

Conceiving of svabhāva as an ontological concept is no doubt the interpretation most commonly found in the contemporary commentarial literature, and one that gave rise to translations using such metaphysical terms as essence, nature, substance, or aseity. In the Madhyamaka literature after Nāgārjuna we find a useful distinction between three different senses of svabhāva in Candrakīrti’s commentary on the MMK, a distinction that is already partly present in earlier Abhidharmika literature. We will refer to the three senses distinguished by Candrakīrti by the terms essence-svabhāva, substance-svabhāva, and absolute svabhāva. 1. See Robinson (1972: 326). 2. Garfield (1995: 89), Komito (1987: 69). 3. Napper (1989: 65). 4. Lopez (1987: 445–446). 5. Ruegg (1981: 9). 6. This distinction is still alive in contemporary dGe lugs commentarial textbook literature. See the annotated translation of dKon mchogs ’jigs med dbang po’s Grub pa’i mtha’i rnam par bzlag par rin po che’i phreng ba given in Sopa and Hopkins (1976: 122). 7. Sopa and Hopkins (1976: 122) refer to these as phenomena’s “conventionally existent nature,” their “true or independent existence,” and their “real and final nature.” Further attempts at differentiating the different

at the Madhyamaka arguments, it is often quite hard to attribute anything like a defensible philosophical theory to the proponents of svabhāva at all, since these often appear to be conveniently set up straw men. 1...
2.1.1. Essence-\textit{svabhāva}

Already in the early Buddhist literature we encounter an understanding of \textit{svabhāva} as a specific characterizing property of an object. One characteristic passage from \textit{Milindapañha} (composed between 150 B.C.E. and 200 A.D.) asserts: 8

Death, great king, is a condition which causes fear amongst those who have not seen the truth. . . . This, o king, is the power of the specific quality (\textit{sarasa-sabhāva}) of death, because of which beings with defilements tremble at death and are afraid of it.

Although at this early stage \textit{svabhāva} does not yet constitute a clearly defined piece of philosophical terminology, it is apparent that it denotes a feature by which a particular phenomenon is to be individuated, thereby rendering it knowable and nameable. This understanding of \textit{svabhāva} is made more precise by the Sarvāstivadins’ identification of \textit{svabhāva} and \textit{svalakṣaṇa}, 9 the specific quality that is unique to the object characterized and therefore allows us to distinguish it from other objects. Objects have specific qualities as their own (\textit{svabhāva}) because they are distinguished from the qualities of other objects (\textit{parabhāva}). 10 In this context \textit{svabhāva} is understood as an antonym to the common characteristics (\textit{sāmānyalakṣaṇa}) which are instantiated by all phenomena. 11

This understanding of \textit{svabhāva} as the specific quality of objects is further restricted by Candrākīrti’s identification of \textit{svabhāva} with the essential property of an object. 12 Every essential property will be part of the specific quality of \textit{svabhāva} in Candrākīrti can be found in Schayer (1931: xii, 55, n. 41), who distinguishes four different senses, as well as in de Jong (1972: 3) and May (1959: n. 328), who distinguish two. Although there are obvious connections with the senses distinguished here, the \textit{svabhāva} as the specific quality of gold but not part of its essential nature. In interpreting \textit{svabhāva} as essence, Candrākīrti notes: 14

For, in common usage, heat is called the \textit{svabhāva} of fire, because it is invariable in it. The same heat, when it is apprehended in water, is not \textit{svabhāva}, because it is contingent, since it has arisen from other causal conditions.

Heat is a property that is always instantiated by fire (and, for Candrākīrti at least, every instantiation of fire is also an instantiation of heat). 15 Water, on the other hand, can be either hot or cold and requires some special conditions (apart from just being water) to heat it up. Although not stated explicitly, the notion of essence-\textit{svabhāva} also appears to include a modal element: if fire lost the property of heat, it would no longer be fire. Water, however, can cool down and still remain water. This conception of \textit{svabhāva} therefore agrees very well with a common understanding of an essence or essential property in contemporary metaphysics, which conceives of them as the properties an object cannot lose without ceasing to be that very object.

The notion of essence-svabhāva is not one Nāgārjuna frequently employs in his arguments concerning svabhāva. One of his rare references to this conception can be found in the Ekaś lokasāstra where he states:

Because one, two and many each have its own bhāva, therefore we call it svabhāva. For example, earth, water, fire, and air are respectively hard, moist, hot, and moveable. Each has its own svabhāva. And because the nature of every one of the things has its own specific quality (svalakṣaṇa) it is said that each has its svabhāva.

Here svabhāva appears to be identified with a quality that each of the four elements cannot lose without ceasing to be what it is. It furthermore plays the role of an object’s specific quality (svalakṣaṇa) which allows the observer to individuate the elements and therefore reflects their essential qualities, that is, their svabhāva.

2.1.2. Substance-svabhāva

The notion of essence-svabhāva, which equates svabhāva with the specific qualities of an object and contrasts them with those qualities it shares with other objects, serves mainly epistemological purposes. It provides a procedure for drawing a line between a variety of objects with shared qualities and thereby allows us to tell them apart.

There is, however, a second understanding of svabhāva which is of much greater importance in the Madhyamaka debate; it considers svabhāva to be a primarily ontological notion. Rather than svabhāva’s being seen as the opposite of shared qualities (sāmānyalakṣaṇa), it is contrasted with conceptually constructed or secondary (prajñaptiṣaṭ) existents and equated with the mark of the primary ones (dravyasat). The distinction between primary and secondary

16. Buddhapālita, on the other hand, clearly has the notion of essence-svabhāva in mind when he claims that the aim of Nāgārjuna was to teach the svabhāva (nīgo bo nīyd) of dependent origination. Wallies (1913–1914: 4:16–17). Since dependent origination identified with emptiness is the exact opposite of svabhāva, this expression would constitute a contradictio in adiecto unless we realize that Buddhapālita wants to say that Nāgārjuna teaches the specific quality of dependent origination.

17. Iyengar (1927: 160). Another translation of this passage of the śāstra can be found in Edkins (1893: 307–307). We might want to note, however, that Lindtner (1982: 16) classifies this text as “most probably not genuine.”

18. Some information on the conceptual relationship between svabhāva and svalakṣaṇa can be found in Ronkin (2005: 110).

19. Nāgārjuna might here have in mind the Vaiśeṣika conception of the five elements (bhūța), all of which are substances (dravya) and are taken to have peculiar qualities which distinguish them from the other elements. See Sharma (1960: 177).

existsents constitutes the most fundamental ontological distinction drawn by the Sarvāstivādins.

Primary existents constitute the irreducible constituents of the empirical world; secondary existents, on the other hand, depend on linguistic and mental construction for their existence. For the Sarvāstivādin, primary existents encompass primarily partless moments of consciousness out of which would be constructed secondary existents, as for example medium-sized dry goods such as tables and chairs. Although both classes of objects were taken as existents (sat), only the primary ones were assumed to possess svabhāva.

On this understanding svabhāva no longer denotes an individuating property of objects by which they can be told apart from other objects (as it did when conceived in terms of essence), but rather is an indication of ontological status.

To have svabhāva means to exist in a primary manner, unconstructed and independent of anything else.

This notion of svabhāva, which we are going to call substance-svabhāva, is also the sense of svabhāva that is most prominent in Nāgārjuna’s arguments. The fifteenth chapter of the MMK, investigating the notion of svabhāva, begins by saying:

Svabhāva cannot result from causes and conditions, because if it was produced from conditions and causes it would be something artificially created. But how could svabhāva be artificially created, as it is not artificially created and not dependent on anything else?

Substance-svabhāva is therefore taken to be something that does not depend on anything else. Candrakīrti in fact takes MMK 15:2b to constitute the definition of svabhāva:

21. Ronkin (2005: chapter 3) argues that there was a gradual move away from a basically epistemological understanding of svabhāva as a characteristic mark to individuate different aspects of experience to an ontological understanding, where svabhāva subsumes objects with a particular ontological status.

22. In the contemporary commentarial literature we find occasional reference to the notion of an intrinsic property to spell out the notion of svabhāva (Tillemans [2001: 14, n. 24]; Siderits [2004: 117]). Intrinsic properties are those that “things have in virtue of the way they themselves are,” while extrinsic properties are had “in virtue of their relations or lack of relations to other things” (Lewis [1986b: 61]). While it is clear that all properties constitutive of a primary existent must be intrinsic, not all intrinsic properties characterize a primary existent. For example, the property of being the tallest man in the room is extrinsic (since a man can have it only in relation to the other men in the room), while that of being a man is intrinsic. However, a man does not exist by svabhāva, since he is causally, mereologically, and conceptually dependent on a variety of factors.

23. Hayes (1994: 311) distinguishes two senses of svabhāva: svabhāva in the sense of identity and svabhāva in the sense of independence. The former expresses the understanding as svalakṣaṇa, the latter as dravya. Hayes then goes on to argue that Nāgārjuna equivocates between these different readings, thereby rendering his arguments invalid (316). For some comments on this point, see Taber (1998); Tillemans (2001); Siderits (2004: 135, n).
This is the definition of it: Svabhāva is not artificially created and not dependent on anything else.  

The notion of substance-svabhāva as “something which does not depend on anything else” is stronger than the one found in the Abhidharma literature. For the Ābhidharmikas, some objects that have primary existence (dravyasat) can be dependently originated. A conditioned object (samskṛta dharma) will have svabhāva but is still dependent on causes and conditions. It would be wrong, however, to assert that the Ābhidharmika’s only criterion for absence of svabhāva is lacking parts, so that all other forms of dependence would be compatible with an object’s being a primary existent. Walser cites a passage from the Theravādin Puggalapaññatti At.thakāthā in which one example of objects existing through dependent designation (upādāya prajñapti, i.e., objects that do not exist in a primary way [dravyasat]) is the measuring of time and space through the revolution of the sun and the moon. Now the division of time into days depending on the rising and setting of the sun is certainly no example of mereological dependence: the latter is not part of the former. It is rather the case that the concepts of day and night owe their existence to the rising and setting of the sun. This is why they are not primary existents but dependently designated, or, as we may also want to put it, conceptual constructs. For the Ābhidharmika, an object existing with svabhāva does therefore not have to be independent of everything (in particular it can depend on its causes and conditions); on the other hand, there are reasons distinct from having parts which explain why a thing is merely a secondary existent (prajñaptisat) and therefore lacking svabhāva.

A view of svabhāva that is not explicitly formulated by Nāgārjuna but is nevertheless prominent in the Indian and Tibetan commentarial literature is that of findability under analysis. Candrakārti observes:

Worldly things exist without being analysed. When analysed, [however], there is no self different from form and the other [four constituents].

25. tasya cedam. laśanam. aktrimaḥ. svabhāvo hi nirapeksah. paratra ca. PP 265:5–6. See also Candrakārti ’s co commentary on Āryadeva’s ČS 12:13: “Here ‘self’ is a self-existent object which does not depend on other objects. The non-existence [of such an object] is selflessness.” de la bdag ces bya ba ni gang zhig dngos po rnam kyi gzhans la rag ma las pa ’i nga bo rang bzhin ste | de myed pa ni bdag myed pa’o. Candrakārti (1999: 321:1–2). See also Tillemans (1990: 126).

28. For a discussion of the variety of ways in which the notion of prajñapti is understood in Abhidharma literature, see Priestley (1999: chapter 9).

30. [...] avicārataśca laukikapadārthhānām asitivāt | yathaiva hi rūpādivyātitrkeṇa vicāryamāṇā āṭmā na sam. bhavati. PP 67:7–8; see Ruegg (2002: 117).

The underlying idea is that whatever is not ultimately real disappears under analysis so that what we are left with must be an ultimately real object existing by its own nature. The reason why composite objects such as a chariot or the self (āṭman) are not ultimately real is that they do not withstand logical analysis (rīgs pas dpnyad bzod pa). Once the chariot or the self is conceptually dissolved into the parts that constitute it, the objects have disappeared and all we are left with are parts collectively conceptualized as a chariot or a self.

Findability under analysis and independence of other objects imply one another. Assume that some objects x have been determined by analysis to be the ultimate constituents of some thing. If the existence of these xs in turn depended on the existence of some y, then only y, but not x, could be a candidate for an ultimately real object. Conversely, if no ultimate constituent can be found under analysis (and if this is not due to practical limitations), that is so because every potential candidate is again dependent on something else.

There are some conceptions of substance in Western philosophy which exhibit a certain amount of similarity with the notion of substance-svabhāva just described. Descartes’s view of substance as something that does not require another thing for its existence springs to mind, as well as Wittgenstein’s theory of logically simple objects presented in the Tractatus. These objects, which are supposed to constitute the substance of the world, are simple, are unchanging, and exist independently of one another and constitute a notion which shares at least some important properties with the Sarvāstivāda’s primary objects.

DEPENDENCE RELATIONS. In order for us to understand this ontological conception of substance-svabhāva, it is important to get a clear idea of what precisely is meant by the dependence of an object on another one. First of all it is important to distinguish two notions of “dependence” which should not be confused. These are

- existential dependence: An object a existentially depends on objects falling under the property F iff necessarily, if a exists there exists something falling under F.

- notional dependence: Objects falling under the property F are notionally dependent on objects falling under the property G iff necessarily, if some object x falls under F there will be a distinct object y falling under G. Saying that a sprout depends existentially on its cause means that necessarily, if a sprout exists there will be some objects falling under the property “causes

31. Trencher (1928: 27); Davids (1890: 44).

32. Principes I, 51.

of the sprout,” such as a seed, soil, water, sunlight, and so on. Similarly, if a complex physical object exists, so will all its parts; therefore the object existentially depends on its parts. Necessarily, if a book exists, so will each of its pages.

Notional dependence, on the other hand, is a quite different case. Northern England depends on Southern England, but we would hardly want to say that this dependence is existential. If because of some geological disaster all of Southern England were destroyed, this circumstance would not affect the existence of the stretch of land now called Northern England. But it affects its description as Northern England, since now there would be nothing south of it which was also England. The concept Northern England therefore depends notionally on the concept Southern England, but the object in the world that the concept “Northern England” picks out does not depend existentially on the object that “Southern England” picks out.\(^{34}\)

It is interesting to note that in the later dGe lugs commenarial tradition, three varieties of existential dependence are distinguished: causal dependence, when an object depends for its existence on its causes and conditions; mereological dependence, when an object depends on its parts; and conceptual dependence, postulating the dependence of an object on a basis of designation, a designating mind and a term used to designate the object.\(^{35}\) These dependence relations are supposed to stand in a qualitative and doxographical hierarchy. Causal dependence is seen as the coarsest understanding of dependent arising and is associated with the Vaibhāṣikas or Sarvāstivādins, the Sautrāntikas, and the Cittamātrins; mereological dependence is a bit more subtle; the Svātantrika Mādhyamikas are assumed to understand emptiness in terms of both causal and mereological dependence. The most subtle understanding which incorporates all three forms of dependence is associated with the Prāsan˙gika Mādhyamikas.\(^{36}\)

There are a variety of examples from Nāgārjuna’s works which show that both the notions of existential and notional dependence are employed in his arguments. Verse 13 of the ŚS asserts:37

The father is not the son, the son is not the father, those two cannot exist one without the other, the father is existentially dependent on the son, the son notionally on the father.\(^{38}\) Nāgārjuna obviously means that the son is existentially dependent on the father: if someone \(a\) exists, there exists something falling under the property “father of \(a\).” But claiming that the father cannot exist without the son cannot be a case of existential dependence as well. Abelard (that very man) could have existed without having ever fathered Astrolabius. But Abelard as a father depends notionally on Astrolabius: if nobody was subsumed by the concept “son of Abelard,” Abelard would not fall under the concept “father.”

It is therefore evident that the “mutual dependence” of father and son that Nāgārjuna postulates is based on two different dependence relations, the son depending existentially on the father, the father notionally on the son. For Nāgārjuna’s argument, however, it is necessary that the two entities be related by a symmetric dependence relation.\(^{39}\)

The difficulty disappears if we take into account that if some object \(x\) is essentially \(F\), and if it also depends notionally on some \(y\) being \(G\), then \(x\) will also depend existentially on \(y\)’s being \(G\), since \(x\) has to have \(F\) to exist at all (this is just what \(F\) being an essential property of \(x\) means). Therefore if we assumed that Abelard was the father of Astrolabius essentially, Abelard would indeed depend existentially on his son, since having Astrolabius as a son would be a property Abelard could not lose without being that very man.

Of course we might wonder now why we should assume that Abelard was essentially the father of Astrolabius. Even if we do not think that this is reasonable (because we think that a childless Abelard would have been the very same man), it is important to note that Nāgārjuna intends the father–son example as an argumentative pattern in which different predicates can be substituted. For example, we might think (as Nāgārjuna’s opponent does) that cause and effect have their respective natures essentially. In this case it is then evident that the existential dependence between the two must be symmetric: the effect depends existentially on the cause, but the cause also depends existentially on the effect.

I hope this small example has convinced the reader of the importance of keeping the two different kinds of dependence relation apart when analyzing.

37. Oetke (1989: 11) claims that “the assumption of isomorphism or identity of logical and causal dependence relations [which correspond to our notional and existential dependence relations] explains a significant part of Nāgārjuna’s arguments and simultaneously elucidates numerous apparent difficulties.”
his notion of substance-svabhāva: even though it is an essential property, the heat of fire is no more the svabhāva of fire than it is the svabhāva of water. Let it be recognized that heat, also, is not the svabhāva of fire, because of its artificiality. Here one apprehends that fire, which arises from the conjunction of a gem and fuel and the sun or from the friction of two sticks, etc., is purely dependent on causes and conditions, but heat does not occur apart from fire. Therefore, heat, too, is produced by causes and conditions and therefore is artificial; and because of its being artificial, like the heat of water, it is clearly ascertained that it is not svabhāva.\textsuperscript{43}

Candrakīrti does not attempt to refute the notion of essence- svabhāva but asserts its existence in conventional terms (vyavahāra). If something lacked the property of heat, we would not call it fire.\textsuperscript{44} Candrakīrti’s emphasis is on establishing that essence- svabhāva “does not deserve to be called svabhāva”\textsuperscript{44} and is distinct from the notion of substance-svabhāva that Nāgārjuna deals with. Unlike the case with substance-svabhāva, however, Candrakīrti has no difficulties in agreeing with the usefulness of essence-svabhāva as a concept for everyday usage.\textsuperscript{46} For the Ābhidharmikas, substance-svabhāva does exist; it is the intrinsic and essential quality of ultimately real objects (dravya). The justification for the assumption of such objects is evident if we consider the case of objects consisting of parts.\textsuperscript{47} A partite object cannot exist by svabhāva, since it exists only in dependence on its parts. For the same reason, its parts cannot exist by svabhāva either, as long as they have parts in turn. For the defender of substances this regress must stop somewhere, because even though it might be possible to have a chain of explanations stretching back infinitely (if we explain the properties of the whole by the properties of the parts and then in turn provide an explanation of their properties in terms of their parts), a chain of dependency relations must terminate ultimately, that is, the hierarchy of dependency relation must

\bibitem{43} yad etat ausn. yam. tad api agneh. svabhāvo na bhavañīti g r. hyatāṃkṛta-kātvit iva man. indhānādyasamāgamād aragitādharsan. ādeś cāgner hetupratyayasyāsāpeśka tuvopalabhyyate | na cāgnivyāvairikteḥ ausn. yam sam. bhavati | asmād ausn. yam api hetupratyayajanītam. | tatātaka kṛta-kātvāc cāpānāy. yavat svabhāvo na bhavañīti sput.am avasīyate. PP 260:9–13.

\bibitem{44} Schayer (1931: xix) argues that the Mādhyamika denies the existence of essence-svabhāva. Since everything is causally produced, “there is no property which could never be missing from a particular object” (55, n. 41). While the Mādhyamika will accept this view, the important point is that saying some property is part of the essence-svabhāva of an object of type X does not mean it could never be missing from that object, but that if it was missing we would not consider it to be of type X.

be well founded. The Abhidharmikas consider the entities that are the foundation of the mereological dependency relation to be ultimately real objects which have their properties essentially and intrinsically. These objects exist by substance-svabhāva.

The Indian and Tibetan Madhyamaka literature contains a variety of ways for classifying arguments against the existence of substance-svabhāva. A fivefold classification distinguishes the following kinds:

1. The diamond slivers
2. The refutation of the production from existent or nonexistent
3. The refutation of the four kinds of production
4. The argument from dependent origination
5. The “neither one nor many” argument

1. The diamond slivers, so called because of the power ascribed to this argument in refuting substance-svabhāva, analyzes four ways in which an object could be causally produced: by itself, by another object, by both, or without a cause. This argument will be discussed in detail in section 5.3 of chapter 5.

2. The refutation of the production from the existent or nonexistent concerns the temporal relation between cause and effect. It will be discussed in section 5.4 of chapter 5.

3. The refutation of the four kinds of production is generally taken to refer to an argument that considers the numerical relations between cause and effect: many causes creating many effects, one cause creating one effect, many causes creating one effect, one cause creating many effects. It is the only one of the five arguments that does not have a textual basis in Nāgārjuna’s works; we therefore do not discuss it here any further.

4. The argument from dependent origination considers the compatibility of substance-svabhāva with a variety of dependence relations such as those I discussed in the previous section.

5. The “neither one nor many” argument will be discussed below. I will also examine two arguments against the existence of substance-svabhāva which we find in Nāgārjuna’s works but which are not included in the classification given above: the property argument and the argument from change.

THE PROPERTY ARGUMENT. One problem with the assumption of primary existents endowed with substance-svabhāva becomes evident once we analyze them in terms of the familiar distinction between individuals and properties. According to classical Buddhist ontology there are different kinds of primary existents (mahābhūtas: earth, water, fire, wind), which are distinguished by different qualities. This list is sometimes enlarged to a list of six elements or dhūtas by adding space and consciousness. It is this list of six upon which Nāgārjuna’s account in chapter 5 of the MMK is based. The problem he discusses, however, is independent of our willingness to assume the existence of primary “fire-atoms” and so forth. It arises whenever we assume that there are different categories of primary existents distinguished by different properties.

We can easily conceive of ordinary individuals as lacking some qualities which they in fact possess; for example we can conceive of a red apple as lacking the property of redness and being green instead. In the case of primary existents, however, this is not possible. If we abstract the property of heat from a fire-atom, there is nothing left, unless we believe in a propertyless “bare particular” which could act as the individual instantiating the property of heat. Nāgārjuna considers this possibility in the case of space.

No space is evident prior to the characteristic (lakṣaṇa) of space. If it existed prior to the characteristic, it would follow that it was without the characteristic.

49. Most classifications distinguish either four or five kinds of arguments; there are also slight variations concerning which arguments are subsumed under which heading. For details see Tillemans (1984: 371–372, n. 16).
50. vajrakīṇa, rdo rje gzegs.
51. sadāsatutpadapratisēdaḥ, yod med skye ’gog.
52. catuṣkotyutpadapratisēdaḥ, mu bzhis skye ’gog.
53. pratiyayasamutpadahetu, rten cing ’brel ba ’i gtan tshigs.
54. ekānekavīyogahetu, gcig du bral gvi gtan tshigs.
56. Tillemans (1984: 361). The temporal reading of this argument is not always so clear. Sometimes (1984: 361) it is argued that the diamond slivers and the refutation of the production from the existent or nonexistent are to be distinguished by the fact that the first analyzes the cause, the second the effect. This analysis then investigates whether a cause produces an existent, a nonexistent, a both existent and nonexistent, or a neither existent nor nonexistent effect. See Hopkins (1983: 151–154).
62. MMK 5:7.
64. The ontological status of space is a controversial issue in the Buddhist philosophical literature. Although it is not one of the four mahābhūtas (Dhammajoti 2004: 148–149) the Abhidharmakosābhaṣya nevertheless includes it together with these in a list of six elements (dhūtas) (La Vallée Poussin 1988–1990: 88). Moreover, the Abhidharmamahāvāhinibhasāstra argues that space can be a dominant condition (adhipatipratyaya) for the mahābhūtas and therefore possesses svabhāva (Dhammajoti 2004: 384). Problems with properties of the mahābhūtas will therefore equally apply to space.
65. nākāśam. vidyate kim. c’t pūrvam ākāśalakṣaṇ. āt / alakṣaṇam. prasajyeta syāt pūrvam. yadi lākṣaṇ. āt. MMK 5:1.
Thus assuming that space existed first without its characteristic and only later acquired it, in the way in which an apple can exist without the property of redness which is acquired only once the apple is ripe, commits us to the existence of a propertyless bare particular. This is due to the fact that unlike ordinary objects such as apples, primary existents have all their properties essentially. Since the only essential characteristic of space is its particular space-nature, space without this characteristic is like a knife without a handle which has lost its blade: there is nothing left. For Nāgārjuna, introducing bare particulars at this point is not an option; he claims that “an object without characteristics is not to be found anywhere.”

Why does Nāgārjuna reject the notion of a bare particular? Bare particulars do not appear to be straightforwardly contradictory entities; in fact their existence is postulated by metaphysicians claiming that individuals must be more than just bundles of properties. The problem seems to be this. Let us assume that there was indeed a bare particular left over once we abstracted the property of heat from a fire-atom. Assume furthermore that this particular would have its nature (its bare-particularness) intrinsically and essentially. In this case heat could not be its svabhāva as well, since something cannot have two different svabhāvas. Its further characterization by heat would therefore be superfluous for establishing its status as a primary existent.

Alternatively we could assume that the bare particular did not have its nature intrinsically and essentially but was dependent on something else. We could then ask again whether this something else has its property essentially, and so on. In this case we get into a regress which the opponent of Nāgārjuna has to terminate somewhere, since he wants to establish that some objects (i.e., the true primary existents) exist by svabhāva and are therefore not dependent on anything else. We therefore end up with the first possibility again, as the various properties that make up the supposed svabhāva of the primary elements fire, water, and so forth are superfluous in characterizing these foundational objects as primary existents, since these objects are already existent as such. This is what Nāgārjuna means when he says:

The occurrence of a characteristic is neither in the uncharacterized nor in the characterized. It does not proceed from something other than those with or without characteristics.

If we regard the bare particular as characterized by its bare-particular-ness intrinsically and essentially, any further characteristic is superfluous for bestowing the status of a primary existent. If we do not regard it as so characterized, however, we end up in an infinite regress without establishing any primary existents at all. Since these possibilities are mutually exclusive, the notion of a bare particular seems to be facing a problem.

The proponent of bare particulars might now be inclined to say that all this shows is that the pluralist theory of the six primary elements was mistaken and that we have to assume that there is only one kind of primary existent, namely bare particulars having their nature intrinsically and essentially. They constitute the “pure stuff” of the world which is then “flavoured” by such properties as heat, wetness, etc. in order to form fire-, water- and other atoms.

Bracketing the difficulty of how these different bare particulars are to be told apart, the most important problem with this is that Nāgārjuna’s opponent also wants to argue that the primary existents are mind-independent, that they exist whether or not any conscious beings are around. But while this has a certain plausibility for objects that can be distinguished by their properties (such as the four mahābhūtas or the fundamental particles of contemporary physics), a bare particular from which all characteristics have been abstracted away bears the mark of the mind’s handiwork. Bare particulars are nothing we are immediately (or even meditately) acquainted with—they are conceptual fictions, theoretical entities introduced in the course of constructing an ontological theory, but hardly anything we would suppose exists “from its own side,” independent of conscious minds.

If Nāgārjuna’s opponent does not want to postulate the existence of bare particulars, he might try to solve the problem of properties of primary existents by arguing that primary existents are property-particulars rather than things characterized by properties. This is the dual of the bare-particular view, for we now assume properties without bearers rather than bearers without properties. As a matter of fact, ontological theories based on property-particulars (also called tropes) have become relatively popular in the recent metaphysical discussion. The fundamental idea here is that the redness of an apple is not regarded as one thing inhering in different red objects. The redness of the apple, that of a tomato, and that of a postbox are rather regarded as three distinct property-particulars which are sufficiently similar to be classified under the common name “red.”

70. See Williams (1953) for an early example, Bacon (1995) for a more recent discussion.
Nāgārjuna is clear on his rejecting property-particulars but unfortunately not very explicit on his reasons for doing so. A plausible reason for Nāgārjuna’s rejection is provided by Marks Siderits. If we assume that the different primary existents, such as fire- and water-atoms are just property particulars of heat, wetness, and so forth, we face the problem of how the different atoms are to be individuated. We obviously cannot say that two fire-atoms are different because the property of heat is instantiated in different bearers, because this stance would get us back to the scenario discussed earlier. It seems that the best we can do is individuate clusters of property-particulars, as in saying that in one cluster heat is associated with wetness (as in hot water), in another with solidity (as in a red-hot iron ball), and that in this way the two property-particulars of heat are individuated. However, now the problem is that the independence of primary existents is compromised, as we now have to rely on distinct property-particulars to tell them apart. Therefore their existence as distinct primary existents is not any quality they possess from their own side, but only something they have dependent on occurring in clusters with other property-particulars.

It now becomes evident that whatever analysis of primary existents in terms of individuals and properties we propose seems to face fundamental difficulties. If we treat the primary existents and their properties as distinct and independent entities (as we do in the case of ordinary objects), we realize that the two cannot be independent at all, since we cannot conceive of a primary existent without its characteristic property. If, on the other hand, we subsume primary existents under one side of the individual-property divide, that is, if we assume that they are either bare particulars (individuals without properties) or tropes (properties without individuals), it becomes evident that neither of these can play the desired role of mind-independent foundational objects existing from their own side.

Given that Nāgārjuna regards these options as exhaustive, he considers the above difficulties as a reductio of the notion of a primary existent. For him the primary existents and the properties they instantiate have to be regarded as existentially dependent on one another. If the properties did not exist, there would be no particulars to characterize, and in the absence of the particulars there would be no characterizing properties. But in this case a fundamental property of primary existents is no longer fulfilled: namely that these existents should be independent of all other objects. Depending for their existence on the properties characterizing them, the supposed primary existents cannot produce the foundation for a hierarchy of dependence relations. It therefore turns out that the only satisfactory way of understanding the relation between primary existents and their properties has to deny that there are primary existents in the first place.

the mereological argument. In the same way in which applying the framework of individual and property to primary existents leads to problems, Nāgārjuna argues, conceiving of them in terms of parts and wholes entails difficulties. Ordinary objects are either mereologically complex (i.e., they have proper parts) or they are mereologically simple, that is, they are atomic, partless things. Primary existents, however, the Mādhyamika argues, are neither complex nor simple. Since everything must be either complex or simple, the notion of a primary existent is thereby reduced to absurdity.

While this “neither one nor many argument” is mentioned by Nāgārjuna at several places, it does not play a prominent role in his arguments and is not spelled out in great detail. The later Tibetan commentarial literature, on the other hand, contains quite an extensive development of this argument for refuting substance-svabhāva. We will use some of these materials in order to formulate the details of the argument, which can at best be said to be implicitly present in Nāgārjuna’s texts.

It seems to be clear that we do not want to say that primary existents are partite phenomena. This is so because partite phenomena depend for their existence on their parts, and primary existents are not supposed to be existentially dependent on anything. For any object with parts it is at best possible that its parts are primary existents, but the composite object itself cannot be. This denial of the primary nature of partite entities is a well-entrenched Buddhist position which can be traced back to some of the earliest textual material and provides the reason for Nāgārjuna’s denial that any candidate for a primary existent, whether causally produced or not, can be regarded as having parts.

71. In the absence of the characterized, the characteristic does also not exist. lakṣyasyāmpapattau ca lakṣaṇasyāpy asam. bhavah . MMK 5:4b. 72. (2003: 122–123).

73. A discussion of different ways of individuating tropes is in Schaffer (2001).

74. MMK 5:3, 5.
The other alternative, that primary existents could be atomic, is also denied by Nāgārjuna. In RĀ 1:71 he claims:

Because of having many parts it is not simple; there is nothing which is partless. 81

Unfortunately Nāgārjuna does not give us an argument here for why he thinks that nothing is partless. Considering the secondary literature, we can come up with at least two accounts of what the argument might have been. Their difference is due mainly to different understandings of the word pradeśa ( phyogs), here translated as “part.”

Tucci 82 reads pradeśa as denoting a straightforward mereological part or side of an object and assumes that Nāgārjuna here refers to the well-known Yogācāra argument against the existence of atoms. 83 In a nutshell the idea is that if we assume that atoms can conglomerate to form macroscopic objects, then individual atoms must touch one another, like neighboring mustard seeds in a heap. But if we now regard the side ( pradeśa) of an atom where it touches its right neighbor as spatially coinciding with the side where it touches its left neighbor, the entire conglomerate of atoms will collapse to a single spatial point. If we regard them as spatially distinct, on the other hand, the atom must be seen as spatially extended and therefore it cannot be atomic.

A more comprehensive understanding of the notion of part in the “neither one nor many argument” which we find, for example, in Tsong kha pa subsumes under it not just mereological parts but also temporal stages and aspects ( rnam pa). 84 This approach allows us to run a more general argument than is possible on the purely mereological interpretation.

The question investigated in this case is the relationship between the parts, stages, or aspects of a primary existent and the primary existent itself. 85 For the sake of simplicity, consider the case of a supposed primary existent, say an earth-atom, and two of its properties (say “being solid” and “being heavy”). Now obviously the earth-atom cannot be identical with both these “parts,” because one thing cannot be identical with two. So it must be distinct from them and should be conceived of as an individual which constitutes the bearer of the two properties. But this understanding of primary existents then leads us straight back to the problems we encountered when discussing the property argument: we either end up with a bare particular (which is difficult to consider as existent in a mind-independent way) or with a trope (which cause problems with individuation). The view that primary existents exist without parts, stages, or aspects should therefore be given up. The conclusion Nāgārjuna wants to draw from this is that since everything either has parts or does not, and since neither option is possible for primary existents, our difficulties stem from assuming such a notion in the first place. From a mereological point of view no consistent account of primary existents can be given. It is a notion we should do without, the argument from change. Nāgārjuna considers the existence of substance-svabhāva to be incompatible with change. 86

If svabhāva existed, the world would be without origination or cessation, it would be static and devoid of its manifold states.

But given that we do perceive change in the world, this provides us with an argument against substance-svabhāva:

By the observation of change [we can infer] the lack of svabhāva of things. . . . If svabhāva was found, what would change? Neither the change of a thing itself nor of something different is suitable: as a young man does not become old, so an old man does not become old either. 87

No thing which we perceive to be changing can exist by substance-svabhāva. This is so because an object existing by substance-svabhāva, that is, a primary existent, constitutes an independent, irreducible, and unconstructured fundamental constituent of reality. If the young man had its age as an essential and intrinsic property (i.e., if he was young by svabhāva), he could never grow old.

The obvious reply the advocate of substance-svabhāva should make at this point is to say that both change and substance-svabhāva exist, though not at the same level. Things that we perceive as changing do not possess substancesvabhāva, while those that do possess it do not change.

There are at least two different ways in which we could spell this idea out. According to the annihilationist view, an x-atom existing by svabhāva can never change into a y-atom. What can happen, however, is that the x-atom ceases to

81. naiko ‘anekapradeśatvān nāpradeśaś ca kaścana. rGyal tshab dar ma rin chen in his commentary explicitly regards this verse as a statement of the “neither one nor many argument.” See Hopkins (1998: 103).
82. (1934–1936: 324).
exist and is replaced by a γ-atom. What we perceive as macroscopic change in the nature of entities (hot water cooling down, green leaves turning brown) is in fact nothing but the microscopic arising and ceasing of entities the natures of which do not change. 88

According to the permutationist view, no entities existing by svabhāva ever pass out of existence. The change we observe is merely a difference in arrangement of the eternally existing objects. When hot water cools down, it does so not because the fire-atoms in the water pass out of existence, but rather because the set of permanently existent atoms changes its arrangement so that fewer fire-atoms are now mixed among the water-atoms.

There are two main difficulties for the annihilationist view. First of all it is not obvious to which extent the cessation of entities existing by svabhāva is theoretically less problematic than a change in their nature. The annihilationist view is based on the assumption that if some object passes out of existence, its svabhāva is not changed, since the object does not exist anymore. It did not lose one nature and acquire another one, since there is nothing left that could possibly acquire such a nature. Whether this theory in fact works depends on the interaction of the conception of svabhāva with that of momentarily existent objects. This is an intricate issue 89 which we fortunately do not have to settle here. There remains a second problem: namely answering the question of what is responsible for the cessation and production of entities existing by svabhāva. If they are dependent on causes and conditions for their production and annihilation, then they cannot be ultimately real entities after all, since the whole point of postulating entities existing by svabhāva was to have some objects that are not existentially dependent on any others. 90

The permutationist does not have this problem. He still has to assume that the ultimately real objects congregate in certain ways dependent on causes and conditions. But all this means is that the complex objects thus constituted will existentially depend on each other, as well as on the ultimate reals. The complex objects, however, were never supposed to exist by svabhāva in the first place. The ultimately real objects themselves do not depend on causes and conditions. While the permutationist view thus seems more attractive than the annihilationist one, it has the curious consequence that the supposedly ultimately real objects existing by svabhāva recede more and more.

The idea of fire-atoms as ultimately real objects is obviously only of historical interest. It is far from clear, however, whether the conception of elementary particles of contemporary physics is much more attractive to the permutationist. While the mahābhūtas had the advantage of being relatively close to objects of ordinary experience, such as fire, water, and so forth, various subatomic particles, quarks, or strings are purely theoretical posits very different from anything we usually observe. Nobody has ever seen a string and nobody ever will, since these are not accessible to sensory perceptions. Moreover, their assumed properties are very different from what we observe in the macroscopic world. As with all theoretical posits, claims for their existence are based on the explanatory work this concept can do in a particular theory. It is therefore quite ironic that our best candidates for ultimately real entities existing independent of human conceptualization turn out to be objects that are so highly theorydependent and the existence of which seems to be considerably less secure than that of the medium-sized dry goods with which we interact daily.

It appears that neither the annihilationist nor the permutationist view manage to give a satisfactory explanation of the existence of change in the presence of substance-svabhāva. In the absence of any other explanations, Nāgārjuna thus concludes that our experience of change constitutes an argument against the existence of substance-svabhāva.

Considering the previous discussion, it is evident that most of Nāgārjuna’s arguments, as well as those found in the work of his commentators such as Candrakīrti, are concerned with the rejection of substance-svabhāva, while the examination of essence-svabhāva appears to play at best a minor role. From certain passages in Candrakīrti’s works, however, we get the impression that a third conception of svabhāva is in play in the Madhyamaka arguments as well. This third notion does not seem to share the marginal status of essence-svabhāva and is also not the aim of attempted refutations. We will call this conception absolute svabhāva.

2.1.3. Absolute Svabhāva

Candrakīrti describes absolute svabhāva in the following way. 91 Ultimate reality for the Buddhas is svabhāva itself. That, moreover, because it is itself nondeceptive is the truth of ultimate reality. It must be known by each one for himself.

While he stresses that substance-svabhāva is a notion erroneously ascribed to objects that in fact lack it, 92 he also asserts that svabhāva does not in any

89. See von Rospatt (1995).
way appear to those having misknowledge. It therefore appears that svabhāva is both a mistaken ascription made by beings with deficient cognitive capacities as well as something that does not appear to such beings. To make sense of this notion, we have to assume that there are two different conceptions of svabhāva in play here: substance-svabhāva, which the Madhyamaka arguments attempt to show to be nonexistent on the one hand, and, on the other hand, another kind of svabhāva, which I call absolute svabhāva, which constitutes the true and intrinsic nature of phenomena.

Candrakīrti explicitly characterizes this svabhāva as changeless (āvikārita), not originated (sarvacānātā) and not dependent on something else (paranirāpaka). On the basis of this idea, the later Tibetan commentarial literature conceives of svabhāva as “triply characterized.” Tsong kha pa describes it as

1. Not produced by causes and conditions
2. Unchangeable
3. Set forth without depending on another object

The interesting problem arising at this point is that both Candrakīrti’s attributes as well as Tsong kha pa’s triple characterization are supposed to be applicable both to substance-svabhāva as well as to emptiness, that is, the absence of substance-svabhāva. But taking into account that substance-svabhāva is argued not to exist while emptiness does exist, this view faces an obvious difficulty. The lack of svabhāva seems to have exactly the properties of substance svabhāva, so the absence of svabhāva should both exist (since svabhāva does not) and not exist (since it has the same properties as the non-existing svabhāva).

93. MAB 107: 15. See also 306.

95. PP 265:1–2.

100. This is the reason why Tsong kha pa does not regard the three characteristics as sufficient for identifying the object of negation (dgag bya). ‘Jam dbyangs bshad pa asks in the mChen bu zhok: ‘di stong nyan kyi khyad par rin po chen pas dgag bya ga la rlung. “These [three characteristics] being characteristics of emptiness, how could they be the object of negation?” (Jamb dbyang bshad pa et al. 1972: 387.6). Emptiness (that is, the absence of svabhāva) appears to be a contradictory concept.

ames’s solution. William Ames, in his analysis of Candrakīrti’s use of the concept svabhāva, tries to resolve this problem by arguing that substance-svabhāva and lack of svabhāva or emptiness do not collapse into one another, since the latter differs from the former in two important ways:

1. Being purely negative, it does not satisfy the implicit condition that svabhāva be a positive quality. (2) It is not a quality of things, but a fact about qualities of things, namely, that none of them are svabhāva.

It appears to me that neither of these supposed differences can be made to carry much weight. The difference between “positive” and “negative” qualities seems to be purely an artifact of language. If our language did not contain the word “blunt,” we might describe a blunt knife as “not sharp” and conclude that sharpness is a positive quality while bluntness is not. If we did not have the word “sharp,” the reverse would be the case. But we would not have to assume that this indicates any difference between the properties we refer to.

Concerning the second point, it does not seem to help much to observe that there is a fact about qualities of things which holds continuously, causelessly, and necessarily. All we have done is push up the location of svabhāva to the level of second-order properties: it is now not the property of heat (or any other first-order property) which qualifies as the svabhāva of fire, but one of its second-order properties, that is, the property that none of its first-order properties is the object’s svabhāva. But it is hardly satisfactory for the Madhyamika to avoid the above problem by saying that when he claims that no objects have svabhāva what he really means is that none of an object’s first-order properties are its svabhāva.

TSONG KHA PA’S SOLUTION. Another solution to this difficulty is suggested by Tsong kha pa Blo bzang grags pa (1357–1419). Though this Tibetan scholar is separated from Nāgārjuna by a considerable temporal, geographical, and linguistic distance, both the ingenuity of his solution as well as the considerable influence of his thought on the later interpretation of Madhyamaka justify its

101. Most philosophers would regard this contradiction as a problem with the notion of emptiness. An exception is Graham Priest (2002: 249–270) who regards it as an indication of the fundamentally contradictory nature of reality.

inclusion in this discussion. Tsong kha pa attempts to solve the difficulty by arguing that substance-
svabhāva (i.e., the Mādhyamika’s “object of negation”) is to be distinguished from emptiness by its having additional characteristics. Apart from being triply characterized, substance-
svabhāva is also

4. established from its own side\textsuperscript{103}
5. a natural, not a learned notion.\textsuperscript{104}

Concerning the first, Tsong kha pa states: that

Ultimate truth is established in this way as positing the nature of things (chos nyid) by svabhāva (rang bzhin du), but what establishes it as svabhāva is the fact that it is not fabricated and does not depend on other objects. It does not in the slightest exist by svabhāva which is established from its own side.\textsuperscript{105}

Here Tsong kha pa regards “establishment from its own side” (rang gi ngo bos grub pa) as distinct from “independence from other objects” (gzhan la mi ltos pa) in order to drive a wedge between the characterizations of substance-
svabhāva and emptiness or absolute svabhāva. It should be noted, however, that this interpretation is not shared by all DGe lugs commentators, some of which read Candrakīrti’s nirapekṣah, as meaning “the establishment of an object from the perspective of its own entity.”\textsuperscript{106}

Concerning the second point it should be noted that Tsong kha pa draws a distinction between conceptions of svabhāva that are acquired misconceptions (kun brtags) and those that are innate (lhan skyes). Given the fundamental cognitive change the understanding of emptiness is supposed to bring about, he regards the removal of the latter as considerably more important than the former.\textsuperscript{107} Later commentators\textsuperscript{108} classify the triply characterized svabhāva as such an acquired misconception. The triply characterized svabhāva is too wide

106. rang gi ngo bo’i sgo nas yul gyi steng du grub pa. The relevant passage from Ngag dbang dpal ldan is cited in Magee (1999: 94–95).

a notion to capture the object of negation, which is therefore further specified as an innate rather than an acquired misconception.\textsuperscript{109}

absolute svabhāva as essence-svabhāva Let us conclude by considering one final way of distinguishing substance-
svabhāva from absolute svabhāva in order to solve the apparent contradiction inherent in this understanding of emptiness.\textsuperscript{106} The basic idea is that, while agreeing that both substance-
svabhāva and absolute svabhāva are characterized as (a) not fabricated (akṛṭtrimah.), (b) immutable (na anyathābhāvah.), and (c) not dependent (nirapekṣah.), we assume that (b) and (c) are understood in very different ways for the two different notions of svabhāva. But let us consider these three characterizations in turn.

Absolute svabhāva is described as not fabricated (akṛṭtrimah.) or as “complete nonorigination” (sarvaśa anutpāda) to make clear that it is not in any way produced together with an empty object and does not cease once the object is destroyed. It is therefore unlike the hole in a cup or a vase, which is dependent on the cup or vase for its existence and is destroyed if the cup or vase is broken.

This point can be clarified by considering Candrakīrti’s assertion that svabhāva “neither exists, nor does not exist, by intrinsic nature.”\textsuperscript{111} It is evident that since svabhāva does not exist, it also does not exist by intrinsic nature. But why does it not fail to exist by intrinsic nature? In other words, why does emptiness not exist by substance-
svabhāva? After all, for Nāgārjuna phenomena do not just happen to lack svabhāva, but could not have possibly had svabhāva no matter what.

What Candrakīrti wants to say here is that the property of lacking svabhāva is dependent as well, since it depends on the erroneous ascription of svabhāva in the first place. It is not a property that phenomena have independently of everything else. If someone hallucinates white mice running across his desk, then part of what it means that this is a hallucination is that there are in fact no white mice on his desk. But even someone with a rather promiscuous attitude toward existence-claims concerning properties would hesitate to say that besides being brown, rectangular, and more than two feet high, the table also has the property of being free of white mice. If there is any distinction to be made

109. The problem of the differentiation between substance-svabhāva and absolute svabhāva was later further elaborated in the Tibetan tradition in the context of the debate over self-emptiness (rang stong) and other-
emptiness (gzhan stong). For further details see Hookham (1991); Magee (1999: 103–115).
110. I thank Mattia Salvini for a helpful discussion of this point.
111. na tadastī na cāpi nāstī svarūpātah. PP 264:3. The terms svarūpa and svabhāva are generally used interchangeably by Candrakīrti.
between the properties an object has in itself and those that are merely ascribed to it by an observer, purely negative properties such as being not round or being free of white mice seem to be the best candidates for being included in the latter category.

Candrakīrti stresses this point in a passage dealing with a person suffering from vitreous floaters which cause the illusory appearance of hairlike objects in the visual field. An ordinary observer would not generally ascribe the property “free of hairs” to an empty pot, since this is one of the countless things the empty pot is empty of. But in order to correct the impression of the patient with the eye disease, the pot might indeed be described in this way. The property of hairlessness (like that of the absence of svabhāva) is something ascribed to an object to correct a mistaken attribution of the property of being filled with hairs. It is not a property an object would have independently of such an attempt to rectify a mistake.

Emptiness as a correction of a mistaken belief in svabhāva is therefore not anything objects have from their own side, nor is it something that is causally produced together with the object, like the empty space in a cup. It is also not something that is a necessary part of conceptualizing objects, since its only purpose is to dispel a certain erroneous conception of objects. In the same way as it is not necessary to conceive of tables as free of white mice in order to conceive of them at all, in the same way a mind not prone to error would have independently of any attempt to rectify a mistake.

When absolute svabhāva is interpreted as immutable (na anyathābhāvah.), as changelessness (avikaritva) and ever-abidingness (sadaiva sthāyitā), this interpretation does not mean the same as, for example, the Sarvāstivādin’s primary existents (dravya) being described in this way. Emptiness is not to be regarded as some unchanging, permanent, absolute reality. Candrakīrti does not mean that if some empty object like a pot or a flower is destroyed the pot’s or flower’s emptiness somehow stays behind, as it is changeless and ever-abiding. If the pot or flower is destroyed, there is no use in referring to its emptiness. The point is rather that whatever phenomenon is conceptualized by ordinary beings will turn out to be empty, since they will ascribe substance-śvabhāva to this phenomenon, and it is empty of such svabhāva. In this sense emptiness is unchanging, since it is a property to be ascribed to all things ever considered, once they have been correctly analyzed.

Finally, when we say that something is not dependent (nirapeksah.), there are two different things we can mean. We might want to say that it does not depend on any object whatsoever or that it does not depend on some specific object. For example, when saying that a mathematical theorem is independent we might make the claim that it does not depend on anything (human beings, minds, the world) for its existence, or we might mean something much weaker, namely that it does not depend on some particular thing (the person who proved the theorem, its inscription on a blackboard), that is, that it would exist if someone else had proved it or if some inscription or other existed on some blackboard or other.

These two meanings can also be employed when one is speaking about śvabhāva. We could say that if something exists by śvabhāva, it does not depend on anything whatsoever. This is the meaning of śvabhāva that is usually identified with substance-śvabhāva and that corresponds to the Sarvāstivādin’s primary existent. But we could also say some property exists by śvabhāva if as long as any objects are around they have that property. This, I would want to argue, is the best way to understand the assertion of emptiness being not dependent. It does not mean that emptiness is some sort of primordial reality ante rem but rather that as long as objects exist, and are conceived of by beings with deluded minds more or less like ours, then these objects will be empty.

The bottom line of this way of resolving the difficulty is the claim that for Nāgārjuna there are not three different senses of śvabhāva, but only two. Absolute śvabhāva is equated with the essence-śvabhāva of all objects. In the same way as the property of heat constitutes the essence-śvabhāva of fire, emptiness, that is, the absence of substance-śvabhāva, constitutes the essence-śvabhāva of all things. There are therefore only two different senses of śvabhāva to be distinguished, namely essence-śvabhāva and substance-śvabhāva; what I have called “absolute śvabhāva” turns out to be an instance of the former. Apart from resolving the above contradiction, this view also allows us to make sense of such characterizations of emptiness as the “objecthood of objects” (dharmān. ān. dharmaṭā), “thusness” (tathatā), “intrinsic nature” (tatsvarūpam), or “original nature” (prakṛti). These epithets do not equate emptiness with some objectively existent noumenal reality but simply indicate that emptiness is a property all objects could not lose without ceasing to be those very objects.

2.2. The Cognitive Dimension

If we conceive of the Mādhyamika arguments about śvabhāva solely in ontological and semantic terms, we are likely to miss one important dimension of the

112. rab rib, timira.
concept which occupies a central place in the Buddhist understanding of emptiness. This is the idea that the purpose of determining the existence or nonexistence of substance-śvabhāva is not just to arrive at a theoretically satisfactory understanding of the fundamental objects that make up the world, or of the relation between words and their referents, but is supposed to have far more comprehensive implications for how we interact with the world. Nāgārjuna notes in the final verses of chapter 26 of the MMK.Å114

With the cessation of ignorance, formations will not arise. Moreover, the cessation of ignorance occurs through right understanding (jñāna). Through the cessation of this and that (link of dependent origination) this and that [other link] will not come about. The entire mass of suffering thereby completely ceases.

Nāgārjuna claims here that with the realization of the nonexistence of substance-śvabhāva, the first link (ignorance) of the twelve links of dependent origination, which constitutes the fundamental Buddhist theory of the generation of the cognitive constitution of the human mind,Å115 will cease to exist. The first link being cut off, all consecutive links, beginning with formations, will no longer arise. With the cessation of the entire chain, Nāgārjuna argues, suffering, which is the distinguishing mark of human existence, will cease as well. How exactly the twelve links of origination are to be interpreted, and how the cessation of ignorance brings them to a halt, is a complex and much debated question within Buddhist philosophy. It is not one I want to focus on in this context, however. The main idea I want to highlight here is that the cessation of suffering is supposed to be brought about by a cognitive shift, which is constituted by the realization of the absence of śvabhāva.

Candrakīrti remarks in his commentary on the above passage that “the one who sees dependent origination correctly does not perceive a substance (svārūpa) even in subtle things.”Å116 Note that śvabhāva is here not regarded as a theoretical posit, as something an ontologist or semanticist might postulate when investigating the world or its representation in language. The underlying idea here is rather that seeing objects in terms of śvabhāva is a kind of cognitive default which is criticized by Madhyamaka arguments against śvabhāva, such as ones described above. It is important to realize that śvabhāva is seen here as playing a fundamental cognitive rôle insofar as objects are usually conceptualized in terms of śvabhāva. This conceptualization (which the Mādhyamika tries to argue is also theoretically deficient) is taken to be the ultimate cause of suffering. According to this cognitive understanding, śvabhāva is here regarded as a superimposition (samāropa) which the mind naturally projects onto objects when attempting to conceptualize the world. The term samāropa is mentioned only once by Nāgārjuna in the MMKÅ117 but acquires a more prominent rôle in Candrakīrti’s commentary. I think that agreeing with Candrakīrti about the presence of a notion of śvabhāva as superimposition in Nāgārjuna’s arguments allows us to give a theoretically coherent account of his view of śvabhāva, while it also helps us to understand why the establishment of the absence of substance-śvabhāva occupies such a central place in Madhyamaka thinking.

Candrakīrti argues that the understanding of śvabhāva in terms of a superimposition is of central importance for understanding the entire intellectual enterprise of the MMK: Å117

Thus, when it is said that entities do not arise in this way, first of all the initial chapter was written to counter the mistaken attribution (adhyāropa) of false intrinsic natures; the remaining chapters were written to eliminate whatever distinctions are superimposed anywhere.Å118

It is important to note that Candrakīrti is concerned not merely with the refutation of a theory he assumes to be mistaken, but with something more fundamental:

For one on the road of cyclic existence who pursues an inverted [view] due to ignorance, a mistaken object such as the superimposition (samāropa) on the aggregates appears as real, but it does not appear to one who is close to the view of the real nature of things.Å119

Independent of one’s particular theoretical position concerning the existence or nonexistence of śvabhāva, śvabhāva is something which is superimposed on ordinary objects in the process of conceptualization. The five aggregates, for example, are seen as a single, permanent, independent self, because of the superimposition of śvabhāva on such a basis. The same happens when ordinary Å117

partite and causally produced material objects, linguistic items, and so forth are apprehended.

It is because this cognitive default of the superimposition of svabhāva is seen as the primary cause of suffering that the Mādhyamika draws a distinction between the understanding of arguments establishing emptiness and its realization. Being convinced by some Madhyamaka argument that an object does not exist with svabhāva does usually not entail that the object will not still appear to us as having svabhāva. The elimination of this appearance is achieved only by the realization of emptiness. The ultimate aim of the Mādhyamika project is therefore not just the establishment of a particular ontological or semantic theory, but the achievement of a cognitive change. The elimination of svabhāva as a theoretical posit by means of arguments such as those presented above has to be followed by its elimination as an automatic cognitive superimposition by means of specific practices.

But what kind of evidence is there that svabhāva constitutes an automatic cognitive superimposition? I agree with Tillemans that for anyone trying to establish this point “the Indian Mādhyamika literature would offer very little evidence, apart from a number of quotations from scriptures and a lot of doctrinal talk about people being ignorant, under the influence of karma, etc.”

However, it might be possible to adduce some evidence from other sources which make this assumption at least plausible. Buddhist philosophy generally assumes that the superimposition of svabhāva applies to two things: to the self and to other phenomena we encounter. This superimposition at least entails conceiving of the self as unitary and permanent, and also viewing objects as external or observer-independent as well as permanent. We will have more to say on the former when considering Nāgārjuna’s analysis of the self later on, so let us at the moment just consider our perception of objects. I would like to suggest that there is a cognitive default which (a) determines that, other things being equal, we conceive of a sequence of stimuli as corresponding to a single enduring (though changing) object rather than to a sequence of different, momentary ones, and (b) makes it more likely that we assume an external rather than internal object as being the source of the stimulus. Let me call these the principle of permanence and the principle of externality.

The principle of permanence ensures that we generally conceive of objects as enduring phenomena which may change over time but still remain fundamentally the same object, rather than as unrelated momentarily arising and ceasing phenomena, each of which lasts only for an instant. It should be noted that this

latter way of interpreting the information we get through the senses is not in any way logically deficient, it is just not the way we see the world. There are good reasons why we do not do so, primarily that such a representation is vastly too complex to use in practice. Any mind who lived in such a world of kaleidoscopically flashing phenomena would presumably be at an evolutionary disadvantage when compared with one that represented a world of stable, enduring objects. The principle of externality makes us assume that the causes of sensory stimuli are objects lying outside of us rather than the product of our own perceptive mechanism. We generally assume that our perception is evidence for things lying outside of ourselves and that we do not live in a hallucinatory world of our own devising. Again, such a principle makes evolutionary sense: running away from an imaginary tiger is not as detrimental to our chances of passing on our genes as is declaring a real tiger rushing toward us to be a figment of our imagination.

Whether the principles of permanence and externality really determine our conceptualization of the world is of course an empirical question which can hardly be decided in a philosophical discussion such as this. What we can do, however, is to acquaint the reader with two simple empirical results which could serve as evidence that something like these two principles might play an important role in our cognitive access to the world.

The first is the so-called beta phenomenon, which has been known to experimental psychologists for a long time. The subject of the experiment is shown two slides, the first of which contains a dot in the top-left-hand corner, the other a dot in the bottom right-hand corner. What the subject perceives if these slides are shown in quick succession is not two stationary dots, but a single dot moving diagonally from the top left to the bottom right across the slides. What has happened here is that our brain has interpreted the sequence of two stationary dots as a single moving object which is seen first on the left and then on the right. Rather than interpreting this particular stimulus as one object appearing at one spot and immediately disappearing, followed by another object appearing at a different spot, the principle of permanence causes us to see the two dots as indications of a single object changing its position in space. When offered the choice of regarding some sequence of stimuli either as corresponding to a series of momentarily arising and ceasing objects or as an enduring object changing its attributes, our brain seems to opt automatically for the latter.

121. The earliest description of the beta phenomenon is in Wertheimer (1912); further results and interpretations are given by Dennett (1991) (who erroneously refers to it as the phi phenomenon) and Hoffman (1998).

122. The problem of “object permanence,” i.e., of the question when two distinct perceptions of an object are regarded as being caused by a single thing, has been investigated extensively in developmental
Some evidence for the principle of externality can be drawn from the psychological investigation of dreaming, in particular of the phenomenon of lucid dreaming. A lucid dream is a dream in which the dreamer is conscious of dreaming without waking up. Although lucid dreams happen spontaneously to some people, there are also a variety of techniques for inducing them. But the fact that some special effort is required to have a lucid dream points to the fact that our natural reaction to perceptions in dreams is to regard them as caused by external objects rather than by our own mind. So it seems that our view of sensory information both in the waking state and in the dream state is generally determined by the principle of externality: in both cases we regard the source of the information to be something that is both external to us and existing independently of us. It requires a particular cognitive effort to question in a dream whether the things one sees are indeed caused by external sources, an effort which appears to be essential in inducing lucid dreaming.

If it is plausible to understand the Mādhyamika’s notion of superimposition \((\text{samāropā})\) of substance-\(svabhāva\) in terms of certain cognitive defaults (such as the principles of permanence and externality) which govern our representation of the world, then it becomes clear why the Mādhyamika draws a sharp line between intellectual understanding and realization. As familiarity with any optical illusion attests, neither merely understanding \(that\) it is an illusion, nor even understanding \(how\) it works, will make the illusion go away. Now if there was a way of training oneself out of perceiving a particular illusion, we would have an apt example of the relation between understanding and insight as seen by the Mādhyamika. First of all we have to gain an understanding of how the illusion (in this case the superimposition of substance-\(svabhāva\)) works, and in a second step we have to follow some training which eventually makes even the appearance of the illusion go away.

But now this point also indicates the limitations of appealing to results from cognitive science for gaining a better understanding of \(svabhāva\). Even though such references are useful in giving us an idea of why the Mādhyamika’s view of superimposition could be plausible, they give us very little insight into how the removal of such superimpositions could be possible and what it would entail. The reason is obvious: according to the traditional Buddhist view, those who have realized (as opposed to merely understood) the absence of \(svabhāva\) provide us with an interpretation as a superimposition.

and thereby emptiness are few and far between. Empirical research into the way such persons perceive the world is therefore naturally difficult. Fortunately this is not a task the present discussion has to achieve. For our purposes it is sufficient to point out that a mere understanding of \(svabhāva\) as a theoretical posit (arrived at within an ontological or semantic theory) is not sufficient for understanding the central role it occupies in Buddhist thought. The notion of \(svabhāva\) must also be something that plays a much larger part in the mental life of the majority of people who are after all neither ontologists nor semanticists. The cognitive understanding of \(svabhāva\) provides us with an interpretation that achieves this goal.

3 The Role of Negation in Nāgārjuna’s Arguments

Chapter 2 acquainted the reader with the main objective of Madhyamaka thought, that is the rejection of \(svabhāva\). Before we can discuss the further ramifications of this idea in Nāgārjuna’s philosophy, it is necessary to discuss some formal aspects of his arguments which those acquainted primarily with Western philosophical literature might find puzzling. They arise mainly from specific logical and methodological considerations connected with the concept of negation which were widespread in Indian philosophy but are not always shared by the Western notion of negation, which is derived primarily from formal logic. What makes the issue particularly intricate is the fact that there exists a tension between some presuppositions of the traditional Indian account of negation and the contents of Nāgārjuna’s philosophical views, so that Nāgārjuna sometimes sees himself challenged to adapt these presuppositions in order to formulate his philosophical position.

In this chapter I will discuss Nāgārjuna’s view of the standard conception of negation as presented in the Nyāya system. Chapter 4 will discuss a specific form of argument, the \(catuskōṭi\) or tetralemma, which is frequently employed in Nāgārjuna’s writings and essentially involves single and iterated negations.

Nāgārjuna’s central argumentative aim is to develop a philosophical theory which does not have recourse to the notion of substance or \(svabhāva\). His main strategy is to examine all the possible ways in

125. Further investigation of our perceptions of the self, of causality, or of mereological relations might provide other aspects which cohere with the view of \(svabhāva\) as a superimposition.
which particular phenomena (such as physical objects, causation, the self, language, etc.) could be thought to exist with *svabhāva*, and to conclude that on close inspection none of these are satisfactory. It then remains to conclude that the phenomenon in question does not exist with *svabhāva*. Since many of Nāgārjuna’s conclusions are therefore negative ones, it is essential to gain a clear understanding of the role of negation in his philosophical system. Doing so is more difficult than it may sound initially, especially because Nāgārjuna’s discussion of these matters, the greatest part of which is to be found in the *Vāraṇasī Sūtra* and, to a lesser extent, in the *Vaiśeṣika Prakāśa*, is formulated against the background of the Nyāya theory of negation. This differs significantly from accounts of negation with which those acquainted primarily with Western philosophical discussions are likely to be familiar.

### 3.1. Nyāya Theory of Negation

The philosophical system known as “Nyāya” incorporates a comprehensive theory of logic and epistemology which proved to be extremely important in Indian intellectual history, influencing not only different kinds of philosophical inquiry, but also such disciplines as linguistics, poetics, rhetoric, and law.¹ The system is based on the *Nyāyasūtra* attributed to Gautama (also known as Akṣapāda). There is little agreement on when the sūtra was composed; the dates proposed range from the sixth century B.C. up to the second century A.D.² It is, however, relatively clear that it achieved the form in which it has been transmitted to us around the time of Nāgārjuna and might even have in parts been composed as a reply to Nāgārjuna’s arguments.³ We must therefore keep in mind that when we refer to the relations between Nāgārjuna’s Madhyamaka and Nyāya we are dealing with a very early phase of the latter. At Nāgārjuna’s time none of the long sequence of works on Nyāya,⁴ including Vātsyāyana’s *Bhāṣya*, had been written yet.⁵

3. Bronkhorst (1985) argues the greatest part of the NS existed before Nāgārjuna and was known to him, and that some parts were added later in response to Madhyamaka objections. Bronkhorst’s conclusions have been severely criticized by Oetke in his (1991) and (1997). For a reply see Bronkhorst (1993).

5. For more details on the relation between the *VV* and the NS see Meuthraith (1999).

In order to understand the Nyāya theory of negation, we have to note that in the underlying ontological system, properties are seen as separate entities over and above the substrata in which they inhere.⁴ Now the Naiyāyiaka regards the absence (*abhāva*) of a property as a category in its own right (*padārtha*),⁵ as something that can equally be possessed by a substratum.⁶ The referent of a negative statement such as “there is no pot in the house” is therefore regarded as the qualification of the house by an absence, namely the absence of a pot.⁷ Judgments, whether they are affirmative (“There is a pot in the house”) or negative (“There is no pot in the house”) involve a qualification or an attribution, which can be either an attribution of a presence or an attribution of an absence. As such the attribution can be construed as either affirmative or negative. Whether it is expressed by an affirmative or a negative statement is then a question about how the judgment of that attribution is formulated in ordinary language, not a fact about the attribution itself.⁸

According to the Naiyāyiaka account, a judgment is correct if it combines some parts of reality in the way in which they are indeed combined (such as the house and the absence of the pot, if there is no pot in the house), and it is erroneous if it combines elements from reality in a way in which they are not combined (such as the house and the absence of the pot if there is a pot in the house).⁹ Error will therefore always arise from the way elements are combined in judgments, never from simple perceptions. For the Naiyāyiaka “a simple, noncomplex property can never be empty.”¹⁰

6. Matilal (1968: 16). The Nyāya system of logic and epistemology usually relies on the Vaiśeṣika ontology. The association between the two systems is so close that one often refers to them jointly as Nyāya-Vaiśeṣika. Opinions differ on how the two systems came to be associated, and even on whether we are to speak of two systems rather than one. See Potter (1970–2003: II, 12–13); Bronkhorst (1985: 123–124).

8. We will not go into the reasons offered in defense of this assumption. Sharma (1970: 3–11) argues that the conception of liberation (*mokṣa* or *apavarga*) espoused by the Nyāya-Vaiśeṣikas made it “imperative for this system to posit Absence as an ultimately real entity (*padārtha*)” (6), so that this ontological point also acquired soteriological significance.

11. Matilal (1970: 95). As such there is a close similarity between this view and the familiar correspondence account of truth we find, for example, in a semantics based on states of affairs. There the sentence “there is a pot in the house” is regarded as true iff the referents of the constituents of the sentence (the pot, the house, the “inside of” relation) are arranged in structurally the same way in the state of affairs in which the constituents are arranged in the sentence. The main difference is, of course, that this view does not accord any ontological status to absences, as the Nyāya theory does.

3.2. Negation and Nondenoting Terms
This concept leaves us with a substantial difficulty if we want to deny the existence of certain entities, for the Naiyāyika faces the very problem Quine observes at the beginning of “On what there is”:\textsuperscript{13}

When I try to formulate our difference of opinion, I seem to be in a predicament. I cannot admit that there are some things which [my opponent] McX countenances and I do not, for in admitting that there are such things I should be contradicting my own rejection of them.

Suppose we want to say that Pegasus does not exist (or that every place is characterized by an absence of Pegasus). Such a judgment would intuitively be regarded as true, but for the Naiyāyika a true judgment has to combine elements of reality in the right way. But Pegasus is not an element of reality, since he does not exist. Matilal observes:\textsuperscript{14}

The property of Pegasus-ness thus arrived at would be, according to Nyāya, unexampld or fictitious because it has no locus to occur in, that is, no locus possesses this property. In such cases, Nyāya asserts that we cannot even say that such a property is absent or does not occur somewhere. . . . Thus, if a sentence is said to express an absence of such an unexampld property, it becomes nonsensical.

Now of course this does not mean that in adopting the Nyāya semantics we have no way of saying that a possible entity (like Pegasus) or an impossible one (like the round square) does not exist. If this was indeed the case it would not be a very satisfactory theory to begin with. What we have to do is to rephrase the statement to make evident that the source of the vacuity of such properties is the combination of more basic properties each of which exists in reality but which are not thus combined in the world. So the Naiyāyika can make the meaningful assertion that wingedness and horseness are never combined in the same animal, and that roundness and squareness are never combined in the same figure.\textsuperscript{15} All the properties referred to now have referents in reality, so the Nyāya’s semantics is taken care of.\textsuperscript{16} There is an obvious similarity between this approach and the Russellian procedure of replacing a non-denoting term by a definite description.\textsuperscript{17}

This view of non-denoting terms is just a reflection of the fact that for the Naiyāyika, language must hook up with the world at some fundamental level via a denotation relation. Even if there are non-denoting terms in our language, they can exist only parasitic on denoting terms. Simple designators are therefore guaranteed to refer, while complex designators may or may not do so. This of course means that according to Nyāya theory, negative statements involving simple designators (statements of absence of some entity) can only ever be statements of a local absence and will always entail the presence of that entity somewhere else.\textsuperscript{18} In his \textit{Vārttika} on Vātsyāyana’s \textit{Bhāṣya} on 2.1.12 of the NS Uddyotakara notes:\textsuperscript{19}

\begin{quote}
[W]hen the word “jar” is coordinated with the term “does not exist” it does not convey the non-existence of the jar; all that it does is to deny, either the [spatial] connection of the jar with the house or its specification [as located at] a particular point in time.
\end{quote}

Since the statement “There is no pot in the house” or “There is an absence of a pot in the house” is meaningful only if the pot referred to does indeed exist, it must be present somewhere else. It would be nonsensical if there were no pots at all, at least if “pot” is regarded as a simple designator. Vātsyāyana raises this objection in his commentary on the passage from the NS 2.1.11, where he argues against the opponent’s attempt to deny the existence of means of knowledge:\textsuperscript{20}

If you want to deny the existence [of the means of knowledge, this denial] implies their existence, and the refutation of [means of knowledge like] perception and so forth is not accomplished.

Phaṇibhūṣana’s subcommentary elucidates this point by adding:\textsuperscript{21}

The very attempt to deny their existence presupposes the admission of their existence inasmuch as there is no sense in demolishing the possible existence of something which has no existence at all, just as it is impossible to smash with a stick the jar which does not exist.

\textsuperscript{18} Phaṇibhūṣana (Chattopadhyaya and Gangopadhyaya 1968: II:28) remarks that “there is no sense in denying the absolutely non-existent like a flower imagined to blossom in the sky. The denial of something can have sense only when its existence is admitted somewhere else, e.g., to say that there is no jar in the room means that it exists elsewhere.”
\textsuperscript{20} \textit{tad yadi sambhavo nirvātyate sati sambhavo pratipādayati apratyakṣādīnām. pratipādayati apratyakṣāpapati}. Nyāya-Tarkatirtha and Tarkatirtha (1985: 425: 2–3).
\textsuperscript{21} Chattopadhyaya and Gangopadhyaya (1968: 2: 26).
The idea that simple designators have to have a denotation seems to possess some intuitive plausibility. Suppose I present you with some simple, non-denoting name such as “Hopzik.” You could not be taught the meaning of “Hopzik” by ostension (since there are none), nor could I give you an analysis in terms of other properties (since it is a simple designator). But then the problem occurs of how you could make sense of any sentence containing the term “Hopzik,” including statements such as “Hopzik does not exist.” We do not have any idea what this negation means, since we do not have any positive notion of the entity being negated.

Having taken account of this background, it is understandable that the issue of non-denoting terms is raised by the Naiyāyika opponent against the central philosophical thesis of Madhyamaka that there is no svabhāva. He argues that if the Madhyamaka claim was true and if there was indeed no svabhāva, then the claim would be nonsensical. For if a negative statement about svabhāva was interpreted along the same lines as a negative statement about a pot in the house,22 we would have to hold that the existent svabhāva stood in an absence relation to the world in the same way as the pot stood in an absence relation to the house. But if we understand the statement in this way, svabhāva exists after all and so the Madhyamaka thesis must be false. The statement “there is no svabhāva” has to be either false or nonsensical, since “there is no name without referer.”23

A later manifestation of the same difficulty can be found in certain problems connected with formal reasoning.24 According to the Nyāya theory, a formally set out “inference for oneself” (svārhānumāna) establishing that the subject (pakṣa) has the qualifying property (sādhya) must provide both an agreeing and a disagreeing example (udāharana).25 Thus, in order to establish the thesis that all white things are colored we need both an “agreeing” example of a subject having the qualifying property (such as a conch shell, which is both white and colored), as well as a “disagreeing” example of the contraposed version (“whatever is not colored is not white,” space, which is neither, being a case in point).

But we realize that this reasoning leads to a problem if we assert a universal thesis such as “all things lack svabhāva” or “all things are momentary.” In this case the disagreeing example would have to be an instance of some object that has svabhāva or is not momentary. Since we want to establish that there are no such things, the term has to be empty. But if the occurrence of an empty term renders a statement meaningless, as the Naiyāyika asserts, it immediately follows that the two theses cannot be established. If, on the other hand, the two theses are meaningful (as they appear to be), then they must assert absences of existent things, and svabhāva or the property of permanence must exist. So once again we are faced with the unenviable choice between falsity and nonsense. Nāgārjuna suggests a variety of possible replies to the Nyāya difficulty of non-denoting terms. First of all he remarks:26

To one who says that the name is sadbhūta you would have to reply: “There is svabhāva.” . . . [However,] since things have no svabhāva, that name also lacks svabhāva. Because of this it is empty, and, being empty, it is not sadbhūta.

Bhattacharya27 here translates sadbhūta as “existent.” This does not strike me as a very fortunate rendering, primarily because Nāgārjuna does not want to claim that emptiness entails a lack of existence. It is evident that what Nāgārjuna wants to say in the first sentence is that if the Nyāya account was indeed correct (and each simple term in a negative statement had to denote an existent object), svabhāva would exist. It therefore seems plausible that saying that a name is sadbhūta is supposed to mean not that the name exists (something that neither Nāgārjuna nor his opponent denies) but that it functions in accordance with Nyāya theory: that each non-complex term is hooked up with a designated object in the real world.

But this is exactly what the proponent of emptiness denies. For the Madhyamika, a satisfactory semantics cannot consist in an objectively existent reference relation which links the terms of our language to an objectively existent world. He will argue that both the question of how the world is sliced up into individual entities and the question of how these entities link up with the parts of language are to be settled by convention. There is no “ready-made world” of simples out there which could provide the semantic foundation for the simple terms of our language.28

Nāgārjuna therefore argues in this passage that the Naiyāyika criticism is justified only if one is antecedently convinced of the Nyāya picture of semantics. This, however, is something that the Madhyamika does not want to share.

22. VV 11.
24. This is discussed in Matilal’s analysis of part of the Ātmatattvaviveka by Udayana (10–11th century a.d.) in (1970).
26. yo nāmātra sadbhūta. brāyāt svasvabhāva iti evam bhavatā pratīvaktavyam. syāt [. . .] tad api hi bhāvasvabhāvasya abhādvaṁ nāma nih. svasvabhāva tamāc cchānayam ānyatvād asadbhūtaṁ. VV(S) 76:16–77:2.
28. See chapter 9 for further discussion of this point.
We might wonder at this point why a relatively obvious reply to the Naiyāyika worry about statements like “there are no objects existing with svabhāva” is not made by the Mādhyamika. This reply consists in arguing that svabhāva is not a simple designator. As we saw earlier it is possible to assert that there are no unicorns even on Nyāya terms. This is done by rephrasing the statement as an assertion about real entities (such as hornedness and hornsness) that do not occur together. We could now similarly break up the property “existing with svabhāva” into its simpler components (such as not depending causally on other phenomena, not depending notionally on other phenomena, and so forth) and argue that since all these dependence relations exist, all we are asserting by a statement denying svabhāva is that there is no object that is qualified by the absence of all these dependence relations at the same time.

This reply is certainly adequate for answering the Naiyāyika worry, but it is hardly a position a Mādhyamika would want to adopt without further qualification. For, according to the Naiyāyika’s interpretation of this answer, there is still a world of objectively existent simple properties which the simple terms in our language refer to in a way that is independent of linguistic conventions. While the statement “there is no svabhāva” is thus at least rendered comprehensible to the Naiyāyika, it is done so at the price of accepting a view of semantics fundamentally at odds with the one the Mādhyamika is arguing for. For this reason trying to establish that svabhāva is a complex designator is not a very satisfactory response by Madhyamaka standards.

Within the context of discussing the problem of negating a non-denoting term, Nāgārjuna also discusses a somewhat curious objection raised in VV 12. The opponent asks about the point of negating a non-existent object since “the negation of a non-existent, such as the coolness of fire or the burning of water, is established without words.”\(^{29}\) This passage assumes that there are two kinds of negation for the opponent: those established without words, and those established with words. If one looks at the choice of examples used, it seems that members of the former group include negations of an essential property of an object, such as the heat of fire. What kinds of negation are included in the latter group is not quite clear. A reasonable assumption is to include negative contingent statements in here (such as “There is no pot in the house”). Now the opponent does not want to say that the absence of the pot in the house is brought about by the assertion “there is no pot in the house”: just saying it is so does not make it so.

There are two different ways of understanding what the opponent could mean here. First, note that the Naiyāyika does not draw any fundamental distinction between the judgments expressed by affirmative and negative statements. As Matilal observes:\(^{30}\)

All determinate cognitions or judgmental cognitions (savikalpa jñāna), which can be very well regarded as the counterpart of statements, involve a qualification or attribution, and such an attribution cannot be construed as either affirmative or negative.

The affirmative–negative distinction is not one the Naiyāyika regards as ontologically fundamental. Whether a particular statement is affirmative or negative just mirrors the way the particular qualification or attribution is expressed in ordinary language. What is meant therefore by saying that a negation such as “There is no pot in the house” is established with words is that it is only by the force of language that a negative meaning is expressed. The world itself contains no negations, only presences and absences of different kinds. It is only the words that bring negations into existence.

The absence of a non-existent entity (such as the absence of the opposite of an essential quality, like the absence of coolness in fire) can be regarded as a “negation established without words” (vacanād vinā siddhah. pratiseṛaḥ.), since it cannot rely on language for its expression as a negation, because the Nyāya restrictions on non-denoting terms render the phrase “absence of coolness of fire” meaningless. It is of course the case that there is no coolness in fire, but, for the sake of argument assuming that “coolness of fire” is a simple designator, this is not something that can be expressed in language, nor is it something that indeed needs to be expressed. We might, after all, think there is a pot in the house when there is none, but who would think there is coolness to be found in fire?

Second, we can understand the claim that some negations are established with words while some are established without not as referring to the negation itself, but rather as referring to the corresponding cognition of the negation created in our mind.\(^{31}\) To establish a cognition like the one that there is no pot in the house, we generally need language (since we are not able to inspect all the parts of a house at once). Other cognitions, however, like those that fire is not cool and water is not burning, are established without linguistic mediation. Our acquaintance with fire or water directly acquaints us with these essential properties of them. There is therefore no need to assert the absence of properties that are opposed to the essential nature of things in language. Because the

\(^{29}\) asato hi vacanādvinā siddhah. pratiseṛaḥ. tadyathāgeḥṣaityasya apāmauṣ. yasya. VV(S) 51:6–7.

\(^{30}\) Matilal (1968: 92).

\(^{31}\) As argued below on page 64 this is also the most satisfactory way to understand the opponent’s worry about the temporal relations between negation and negated object.
claim concerning the absence of svabhāva is of the very same nature, it is therefore not obvious what the point of asserting this negation is supposed to be.

Nāgārjuna replies by saying that the purpose of a statement such as “there is no svabhāva” is to point out the absence of svabhāva, not to create the absence of something which is in fact there. He uses the example of saying “Devadatta is not in the house” when he is in fact not there—this statement obviously just reports the absence of Devadatta and does not cause him not to be in the house. We noted above that it is quite unlikely that the opponent should hold such a peculiar position, unless what is created is supposed to be the cognition of the absence, rather than the absence itself. In this case Nāgārjuna could be interpreted as saying that both kinds of negation, those involving essential and nonessential properties, have to be linguistically mediated to be cognized by us.

What would be replied to our first interpretation of the opponent’s worry, that is, the position that the absence of something necessarily non-existent (such as the coolness of fire, or the svabhāva of things) cannot and need not be expressed? We have already seen that the impossibility of expressing such negations depends on the peculiar nature of the Nyāya semantics which the Madhyamaka will not want to accept. And concerning the need to express this negation, the Madhyamaka will argue that while nobody in his right mind will think fire to be cool (and could therefore benefit from having this pointed out to him), the belief in the svabhāva of things is extremely widespread, and realizing its falsity is one of the essential preconditions of liberation. Thinking that there is svabhāva in things is like thinking there to be real water in a mirage.

Deceived people who are likely to run toward the mirage to quench their thirst will benefit from getting to know that there is no real water there, just as ordinary people will benefit from learning that things exist without svabhāva. Nevertheless we might think that when we negate water perceived in a mirage, there is still the person perceiving the mirage, its perception, and the perceived object (i.e., the water in a mirage). Madhyamaka will argue that while nobody in his right mind will think fire to be cool (and could therefore benefit from having this pointed out to him), the belief in the svabhāva of things is extremely widespread, and realizing its falsity is one of the essential preconditions of liberation. Thinking that there is svabhāva in things is like thinking there to be real water in a mirage.

Deceived people who are likely to run toward the mirage to quench their thirst will benefit from getting to know that there is no real water there, just as ordinary people will benefit from learning that things exist without svabhāva. Nevertheless we might think that when we negate water perceived in a mirage, there is still the person perceiving the mirage, its perception, and the perceived object (i.e., the mirage), as well as the person doing the negating (us), the negation, and the object negated (namely real water in the mirage). But if this is the case, the Nyāya will argue we are facing the familiar problem again: if the thing we negate (the mirage, svabhāva) does exist after all, then the statement asserting its negation is obviously a falsity. If, on the other hand none of them exist, if there is no perceiver, perception, and perceived object, no negator, negation, and object to be negated, then the Madhyamaka argument vanishes altogether and the existence of svabhāva is established by default.

What we have to say here (and what Nāgārjuna in fact does say) is that all these things can exist without existing in quite the way the Nyāya supposes. As we have seen for the Nyāya, each of the different entities referred to by the simple designators in a negative statement (a statement of absence) has to be real for the statement to be meaningful. The Mādhyamika, however, thinks that an unreal entity, such as the water in a mirage or the appearance of svabhāva, can very well be the object of an (erroneous) cognitive state and also be able to be referred to in a true sentence. From the fact that “something has become the ‘object’ (viṣaya) of a cognitive state, it does not follow that it must have been causally related to the production of that cognitive state.” This is due to the fact that for the Mādhyamika the source of error is not located exclusively in the erroneous combination of individually existing properties, as the Nyāya assumes. The example of the mirage presents us with the case of a simple yet erroneous perception. As long as we assume that the object of perception and the object of negation are all dependently arisen objects rather than entities existing in their own right, we can deny their existence without antecedently having to regard them as real. Even though the term “the water in the mirage” is non-denoting, since there is no water in the mirage, there is still something created by the interplay of our senses, light, and heat on which the presence of water is superimposed, which we can subsequently deny. Similarly our language and general cognitive habits can, the Mādhyamika argues, create the unreal superimposition (samāropa) of svabhāva which Nāgārjuna’s arguments set out to refute.

31. A similar point is made by Uddyotakara in his Vārttika on Vātsyāyana’s Bhāṣa on NS 2, 1, 11: “negation does not have the power to make an existing thing otherwise [i.e., non-existent]. Because it makes something known, it does not cause the existence of something to cease: [therefore] this negation [too] makes something known and does not cause the existence of something to cease.” na ca pratisedhayitam sāmarthiyam. yad vidyamānam, padārtham anyathā kuryat jājāpayatvāc ca na sam. bhavanīvidyitaḥ jājāpakāḥ ’yam, pratisedho na sam. bhavanivartaka iti. Gautama (1887: 191: 13–15); Jha 1984: (II: 619).

3.3. Negation and Temporal Relations

Apart from worries about negative statements involving non-denoting terms, the second main difficulty to do with negation raised by Nāgārjuna’s opponent concerns the possible temporal relation between a negation and the object negated. This is a form of argument which we encounter frequently in Nāgārjuna’s works, the most prominent examples being in the discussion of the relation between means of knowledge and object known, and between cause and effect.

The worry of the opponent is that there is a general difficulty with negative statements (including the Mādhyamika’s assertion that there is no object with svabhāva). He argues that the negation can exist neither before, after, nor at the same time as the object of negation, and therefore cannot possibly exist. Now this might strike us as a strange position to maintain. Since we usually regard negation, for what is the point of negating something, nor could the negation exist before, after, nor at the same time as the object of negation, that for the Naiyāyika there first.

In order to see the point at issue here, we have to note that for the Naiyāyika the negation is the instrument making known a particular absence of a quality in some substratum. This making known is obviously a causal process, so that it is clear that the Naiyāyika worries here just stem from an application of Nāgārjuna’s criticism of causation to epistemology. The Naiyāyika will argue that if causes and effects cannot exist standing in any of the three temporal relations (as the Mādhyamika sets out to show), then this must also apply to epistemic causes and effects, and thus also to negations, which constitute one particular kind of epistemic cause. Therefore, if we take the Madhyamaka view of causation seriously, we have a problem with establishing the negative thesis that there are no objects with svabhāva.

The argument itself proceeds in the expected manner. The opponent argues that the negation cannot exist before the object to be negated, because then there would be a negation without anything negated. More worryingly, if the negated object does not (yet) exist, what is the point of negating it? Nor could the negation exist after the object of negation, for what is the point of negating something existing? We also have to note that it is only the causal interpretation of negation in this context which allows us to make sense of the opponent’s criticism of the simultaneous existence of the negation and its object. We might think that this was indeed a satisfactory way of thinking of the two (in the same way in which we might think that all the numbers in a mathematical equation exist at the same time). But in considering negation in causal terms we face the problem that “the negation is not the cause of the object known by negation, nor is the object known by negation the cause of the negation.” As is illustrated by the familiar analogy of the two horns of a cow which do not cause each other, in the case of simultaneously existing cause and effect we would have a problem in establishing which is which, since the conceptual distinction between cause and effect is drawn in terms of temporal priority.

There are various ways in which one can respond to this problem. In VV 69 Nāgārjuna tries to turn the tables on his opponent. As we saw, for the Naiyāyika the existence of a negation is equivalent to the existence of an object of negation, that is, of an object whose absence in a particular substratum could be asserted. But if there is no negation, as the Naiyāyika has just been trying to argue, there is also no object whose absence can be asserted, and therefore it follows on the Naiyāyika’s own terms that there is no svabhāva.

A more general way of replying is to point out that in the same way as we can still talk about causal relations even if the realist’s picture of causality turns out to be unsatisfactory, the fact that some epistemic process cannot be made sense of in Nyāya terms does not mean it could not be made sense of at all. After all, what Nāgārjuna criticizes in his analysis of causation is the conception of causes and effects as mutually independent, objectively existing entities. Similarly, in his treatment of epistemology he sets out to refute the conception that being a means of knowledge is an essential property of some cognitive processes. If we do not make this presupposition, however, there is nothing intrinsically problematic with the existence of causes and effects in general, and also not with causes and effects in epistemic processes.

46. na pratīṣedhah. pratīṣedhaysārthasya kār̥anam pratīṣedhaya na pratīṣedhasya ca. VV(S). 54:13–14. This translation appears to me more satisfactory than that of Bhattacharya’s, who just has “object of negation” for pratīṣ. edhasya ārthu (Bhattacharya et al. 1978: 106). It would seem very peculiar to ascribe to Nāgārjuna’s Naiyāyika opponent the view that the object of negation is causally brought about by the negation (or the other way round).

47. See Bhattacharya et al. (1978: 106, n. 1) for a list of references to this example.

48. “By virtue of your statement a negation is not possible in the three times, and, like the negation, the thing to be negated also [does not exist].” tathā hi tvadvacanena pratīṣedhastvaikālye nupapanna pratīṣedhavat sa pratīṣedhyyo ’pi. VV(S) 83:17–18.

49. In VV 107 we find a different reply. Here the opponent argues that once the existence of the means and object of knowledge is denied in the three times, this denial then also infects the possibility of negation of the means and objects of knowledge, which also has to exist in the three times. Nāgārjuna then replies that it is not feasible to first accept the negation of some object and then use this very acceptance to argue for its existence. See the commentary in Tola and Dragonetti (1995b: 100–110).
The *Catuṣkoṭi* or Tetralemma

The second major formal aspects of Nāgārjuna’s arguments we have to discuss is the *catuṣkoṭi* or tetralemma. Even though Nāgārjuna employs this argumentative figure frequently and at important points in his arguments, it is by no means restricted to his writings. In fact the tetralemma is likely to be familiar to any reader of Buddhist philosophical literature. Roughly speaking it consists of the enumeration of four alternatives: that some proposition holds, that it fails to hold, that it both holds and fails to hold, that it neither holds nor fails to hold. The tetralemma also constitutes one of the more puzzling features of Buddhist philosophy, because the use to which it is put in arguments is not immediately obvious and certainly not uniform: sometimes one of the four possibilities is selected as “the right one,” sometimes all four are rejected, sometimes all four are affirmed. It seems that this confusion is only exacerbated by the plethora of treatments we find in the modern commentarial literature, many of which try to analyze the tetralemma by recourse to notions of modern logic. There is no agreement about whether the four alternatives are to be understood as quantified or unquantified propositions, whether any quantification is to be understood substitutionally or referentially, whether the Law of the Excluded Middle holds for them, or whether they should be formalized in classical, intuitionist or paraconsistent logic.

Despite some important work done during the last decades, a comprehensive study of the origin and development of the *catuṣkoṭi* from its use in the earliest Buddhist literature up to its later employment in the Buddhist philosophical works of Tibet, China, and Japan remains yet to be written. This chapter obviously does not intend to fill this gap but has the more modest and more specific objective of giving an interpretation of Nāgārjuna’s employment of the tetralemma that both makes logical sense and sheds most light on Nāgārjuna’s philosophical position.

This discussion is divided into four main parts. The first discusses the Indian distinction between two kinds of negation which will be of central importance for understanding the interrelations of the nested negations found in the tetralemma. The second section considers what might be taken to be a simplified case of the *catuṣkoṭi*, namely Nāgārjuna’s rejection of two alternatives, of a position and its negation. Once the resources for understanding the argumentative role of this argument-schema are in place, we can move on to the third section, in which Nāgārjuna’s use of the tetralemma proper as the negation of four alternatives is considered. This section concentrates on three main questions: whether the four alternatives are logically independent, what the status of the third, “contradictory” alternative is, and how instances of the *catuṣkoṭi* applied to properties are to be related to those applied to relations. The fourth and final section concludes this discussion with an account of the positive tetralemma, in which all four alternatives are affirmed.

4.1. Two Kinds of Negation

The Indian philosophical tradition distinguishes two kinds of negation, referred to as *prasajya* and *paryudāsa*. The origin of this distinction is grammatical; in *prasajya*-negation the negative particle connects with a verb (as in *brāhmaṇa nāsti*, “This is not a brahmin”); in *paryudāsa*-negation it connects with a noun (as in *abrāhmaṇa asti*, “This is a nonbrahmin”).

5. Robinson (1957).

8. One of the most thorough treatments pertaining to its usage in the Madhyamaka context is given by Ruegg (1977).

9. To this extent the present discussion differs importantly from treatments like that of Robinson (1975), who explicitly restricted his investigation to the formal aspects of Nāgārjuna’s arguments (295).

This grammatical distinction corresponds to an important semantic distinction. If we refer to somebody as a non-brahmin, we negate the term “brahmin” and simultaneously affirm that he is a member of one of the three castes. If, however, we simply say “This is not a brahmin,” we negate a proposition (i.e., “This is a brahmin”) rather than a term (“brahmin”) and we do not imply that we speak about a person belonging to one of the three lower castes; in fact we do not have to speak about a person at all. In the Indian philosophical discussion (and particularly in the Madhyamaka context) it is this semantic distinction between implicational term-negation and non-implicational propositional negation which the terms paryudāsa and prasajya are supposed to mark. It is therefore not necessarily the case that, for example, non-implicational propositional prasajya-negation is expressed as verbally bound.12

In fact this distinction is very familiar to contemporary philosophers. Not only can the grammatical distinction from Sanskrit be easily replicated in English, but the semantic distinction between the two types of negation also features prominently in the current discussion, particularly concerning the notion of a category mistake. Given that numbers are abstract objects, it is clear that claiming “The number seven is green” is a category mistake. But what about “The number seven is not green”? This depends on how we take negation to operate in this case.

It has been argued by a variety of authors13 that we have to distinguish two kinds of negation, called choice negation and exclusion negation. A choice negation presupposes that an object falls under a property or its opposite. Presupposing that the apple on the table has some color or other, it must either be red or non-red. If we negate one alternative, we affirm the other. Exclusion negation, on the other hand, “is supposed to reject merely what is denied, without making any presuppositions as to the fulfillment of sortal specifications.”14 Thus if we deny that the apple on the table is divisible by three, we do not presuppose that it is the kind of thing that could be divided by three, but we still (correctly) assert that it does not fall under the property “divisible by three.” It is then evident that “The number seven is not green” is a category mistake only if the negation employed is taken to be a choice negation, not if it is an exclusion negation.

While the distinction between choice negation and exclusion negation gives us a good model for understanding the distinction between paryudāsa and prasajya negations, the two distinctions should not be identified, since there is no textual evidence that Indian thinkers connected the distinction between the two kinds of negation specifically with categorial considerations. Rather, the difference between choice and exclusion negation should be considered as one example of the difference the pair paryudāsa and prasajya indicates. This is the difference between negations carrying with them the presuppositions implied by the propositions they negate, and those that deny these presuppositions. Thus reading the “not” in “The number seven is not green” as a choice negation carries with it a presupposition “The number seven is green” makes, namely that seven is a thing that could be green. This assumption is denied if the “not” is read as an exclusion negation.

Examples of these different kinds of negation that do not rely on sortal considerations are not hard to come by. There are two ways of negating the assertion that the present King of France is bald, one making the negation true, the other making it false or meaningless15; similarly there are two ways of negating the accusation of continuing to be an alcoholic, one asserting that one has stopped drinking now, the other also denying the implication that one ever was a heavy drinker.16

As I will argue, the best way of interpreting Nāgārjuna’s arguments is based on understanding the concepts paryudāsa and prasajya in this particular manner. That is, paryudāsa-negations will be regarded as negations that continue to endorse the presuppositions made by the proposition they negate, while the purpose of prasajya-negations is to be able to formulate negations that explicitly reject some of these presuppositions.

4.2. Rejection of Two Alternatives

The distinction between the two kinds of negation helps to understand an important methodological tool which is used extensively throughout Nāgārjuna’s writings. Consider MMK 18:10, which sets out claiming that

15. The first being “It is not the case that there is somebody who is both the King of France and bald,” the other “The present King of France is not bald (i.e., he has a full head of hair).” The difference between the two is drawn in terms of the scope of the negation operator, that is, put formally, as the difference between ¬(∃x)(Fx ∧ Bx) and ¬(∃x)(Fx ∧ ¬Bx).

16. Shaw (1978: 63–64) notes the interesting idea of representing the proposition a sentence expresses as an ordered set, the last member of which is the sentence itself, the preceding one expressing the presuppositions that sentence makes, the one preceding this its presuppositions in turn, and so on. A paryudāsa-negation can then be understood as negating the final member of the set only, whereas a prasajya-negation negates both it and some (possibly all) of its predecessors.
whatever comes into being dependent on some object is not identical with that object, nor is it different from that object.\textsuperscript{17}

If we ascribe to Nāgārjuna anything like the standard conception of identity (i.e., that identity is the relation that everything bears to itself, and that nothing bears to any other object), it seems hard to make sense of it, at least if we want to stay within the domain of classical logic. Nāgārjuna considers the property “being identical with the object it depends on for coming about” (which we will abbreviate to “being identical with $a$”) and he denies that it applies to any object and also denies that it fails to apply to any object. Expressed semiformally this gives

1. For all $x$ which come into being depending on some particular object, not (identical-with-$a[x]$ or not identical-with-$a[x]$). But applying the familiar laws of logic (in this case DeMorgan’s law and Double Negation Elimination), this statement can easily be seen to be equivalent to

2. For all $x$ which come into being depending on some particular object (not identical-with-$a[x]$ and identical-with-$a[x]$), which is a contradiction.

How can this interpretation be avoided? The key lies in the distinction between the two kinds of negation. We have to assume that the two occurrences of “not” in 1 do not in fact refer to the same concept of negation, but rather that the first is a $\text{prasajya}$-negation, a presupposition-cancelling negation,\textsuperscript{18} and the second is a $\text{paryudāsa}$-negation, understood as a presupposition-preserving negation.

Taking the first negation as $\text{prasajya}$ is also suggested by Matilal,\textsuperscript{19} who claims that on this interpretation “the apparent contradiction of the joint negation” disappears.\textsuperscript{20} Staal claims that such attempts to avoid inconsistency

17. \textit{pratītya yad yad bhavati na āh tāvat tad eva tat / na cānyad api [. . .]}

18. That the first instance of negation is supposed to be $\text{prasajya}$ is stated both by Candrakīrti in PP 13:5 (see Ruegg (2002: 19) for a translation and commentary), and earlier by Bhāviveka in the Prajñāprādīpa ( Walleser 1914: 10:8). Candrakīrti does not explicitly say what kind of negation the second negation is. It is evident, however, that for him it cannot be $\text{prasajya}$-negation too. Considering the first two alternatives of the tetralemma, Candrakīrti argues against the claim that the negation of the first alternative (A) logically implies ($\text{prāpnoti}$) the second alternative (not A). If the “not” in this “not A” was indeed taken to be $\text{prasajya}$, it would be obviously entailed by the $\text{prasajya}$-negation of A. Since it is not so entailed, however, it cannot be a $\text{prasajya}$-negation as well. It is therefore plausible to regard the second kind of negation as $\text{paryudāsa}$, an assumption which, as we shall see, also makes a good deal of exegetical sense.

20. Matilal refers both to the negation of two and of four alternatives (the \textit{cauśkotti}). As we will see, the interpretation of the latter involves additional complications of which Matilal does not seem to be aware.

are unsuccessful, since “it is not true that contradictions do not arise between $\text{prasajya}$-negations.”\textsuperscript{21} However, this reasoning disregards the fact that Matilal’s point was that only the outer negation of the two alternatives is to be regarded as $\text{prasajya}$, while the negations employed \textit{within} the statement of the alternatives are supposed to be $\text{paryudāsa}$-negations. It is therefore the entire set of two mutually exclusive alternatives that is negated, and on this interpretation there is indeed nothing inconsistent about it.

In order to see the motivation for this employment of two kinds of negation, we have to understand that one of Nāgārjuna’s main aims in the MMK as well as elsewhere is to demonstrate the deficiency of some key concepts of our conceptual scheme (such as causation, motion, identity, and so forth).\textsuperscript{22} Their deficiency is taken to be due to a presupposition failure: in the same way that we spot a deficiency in calling the number seven yellow (because the presupposition that numbers are things that could possibly have a color is not fulfilled), Nāgārjuna regards commonsense concepts like causation to be deficient because they presuppose the existence of svabhāva, the independent existence of objects, which, Nāgārjuna argues, is a presupposition that is not fulfilled.\textsuperscript{23} It then becomes easy to see that statement 1 should be interpreted along the lines of

3. For all numbers $x$, not (yellow[$x$] or not yellow[$x$]).

If the outer negation is taken to be exclusion negation and the second to be choice negation, we cannot just read this statement as implying the contradictory statement that all numbers are both yellow and not yellow. Rather we will read it as denying (in a $\text{prasajya}$-manner) that the property yellowness and its ( $\text{paryudāsa}$) opposite (which would imply that numbers were of some other color) fail to be applicable to numbers.\textsuperscript{24} Interpreted in this way, since the outer negation is read as exclusion negation, statement 3 does also not presuppose that any other property is in fact applicable to numbers. In the context of statement 3 this neutrality is not particularly important, since we usually would want to claim that there are other (mathematical) properties that are applicable to numbers. It is important for statement 1, however, since Nāgārjuna wants

21. See Staal (1975: 46). He also claims that the principle of contradiction holds \textit{only for $\text{prasajya}$- and not for $\text{paryudāsa}$-negations}, a claim which he backs up by reference to the Mīmāṃsā concept of two kinds of $\text{paryudāsa}$ (Staal 1962: 60–61). But this claim can serve only to show that the Madhyamaka concept of $\text{paryudāsa}$ is quite different as it is manifestly taken to be subject to the principle of contradiction. Compare the characterization of $\text{paryudāsa}$ by Avalokitavrata given in Kajiyama (1973: 169–172).

24. See Galloway (1989: n. 13, 29–30). “$x$ is yellow” and “$x$ is not yellow” are contraries when the referent of $x$ is sortally incorrect (since they are both false). If the referent is sortally correct they are contradictories. See Raju (1954: 710–711).
to extend his arguments to all other svabhāva-presupposing concepts (which, according to him, are all the concepts we usually operate with). If we therefore read the first “not” in Nāgārjuna’s statement as prasājya and the second as paryudāsa, the following interpretation emerges:

4. It is denied that either the concept “identical-with-a” or its choice negation “different-from-a” can be ascribed to any object x which comes into being depending on some particular object, without assuming that there is any pair of a concept and its choice negation one of which can be applied to such an object.

In order to demonstrate the deficiency of a concept, Nāgārjuna then has to examine both the concept and its paryudāsa-negation and show that both are not applicable to the objects under discussion, in the same way in which we argue that the concept “yellow” is not applicable to numbers because numbers, not being material objects, cannot have a property like yellowness (which is exclusively had by spatio-temporal objects), nor can they have any other color (the paryudāsa-negation of the concept “yellow”).

4.3. Rejection of Four Alternatives

As will be obvious to any reader of Nāgārjuna’s writings, far more common than the case just discussed, where two alternatives (a concept and its paryudāsanegation) are both rejected, is the rejection of four alternatives: the rejection of the application of a concept, of the application of its negation, of the application of both the concept and its negation, and finally of the application of neither the concept nor its negation. For example we read in MMK 22:11: “Empty” should not be asserted, “non-empty” should not be asserted, both or neither should not be asserted, since these are only said for the purpose of designation.

The same argumentative pattern of the rejection of four alternatives is also applied to “permanence” and “finitude” concerning the Buddha to the existence of nirvāṇa, to the existence of persons in the past, to their permanence, and to the finitude of the world.

The employment of the tetralemma can be traced back to the earliest Buddhist scriptures. In the Kandaraka Sutta the four alternatives are employed as a classificatory tool for distinguishing four classes of ascetics: those that torment themselves, that torment others, that torment both, and that torment neither. In this case the fourth alternative is explicitly recommended by the Buddha as the ideal to be emulated.

A case of the rejection of the four alternatives by the Buddha concerning the question whether the Tathāgata exists after death can be found in the Aggivacchagotta Sutta and the Cūl.amālunkya Sutta. Although the relationship between the use of the tetralemma in early Buddhism and its employment by later Madhyamaka authors is complex and will not be investigated here, it is nevertheless important to note at least that two different motivations can be discerned in the Buddha’s rejection of the four alternatives. One motivation is pragmatic; deciding which of the four positions holds regarding specific questions (such as whether the Tathāgata exists after death, whether the world is finite, etc.) is seen to be irrelevant for the attainment of liberation. The Buddha therefore wants to set these questions aside, as is illustrated in the well-known simile of the poisoned arrow. The other motivation is systematic; the Buddha argues that the predicates applied in the four alternatives under consideration are in fact not applicable to their respective subjects, in the same way as any specification of spatial coordinates is not applicable in reply to the question where the extinguished flame of a candle went. All members of an exhaustive set of applications of such predicates (which the four alternatives are taken to be) therefore have to be rejected.

4.3.1. Distinctness of the Four Alternatives

There are a variety of prima facie difficulties in interpreting the four statements of the tetralemma. The first difficulty concerns the distinctness of the four

28. MMK 25.
30. MMK 27:15–18.
33. Nāgārjuna considers the same question in MMK 22:12.
36. For some material on this see Gunaratne (1980).

25. Raju (1954: 701–702) employs this argumentative procedure to show that neither the concept “positive” nor its paryudāsa-negation “negative” is applicable to the number zero (śūnya in Sanskrit) and claims that similarly for the Madhyamaka no concept is applicable to emptiness (śūnyatā). We should note, however, that there is no evidence in the Madhyamaka literature of an explicit connection between the mathematical concept śūnya and the metaphysical concept śūnyatā having ever been made. See Ruegg (1977: 69, n. 154), (1978), Galloway (1989: 27–28, n. 7).
26. śūnyam iti na vaktavyam aśūnyam iti vā bhavet / ubhayam. nobhayam. ceti praṇjaptyartham. tu kathyate.
27. MMK 22:12.
alternatives. It is fairly common in the Western commentarial literature to express the tetralemma in propositional form, so that in MMK 22:11 cited above (letting A stand for the proposition “‘Empty’ should be asserted”) Nāgārjuna is taken to say that all of the following propositions are to be rejected:39

1. A
2. ¬A
3. A ∧ ¬A
4. ¬(A ∨ ¬A)

It is easy to see, however, that on this understanding the final two alternatives come out as logically equivalent.40 Given the prominent place which the tetralemma occupies in Madhyamaka literature, we would have to charge both Nāgārjuna and later Madhyamaka authors with remarkable logical naiveté for not realizing that instead of considering four possibilities, they were in fact dealing with only three.

In order to see how to solve this difficulty, it is important to realize that once the fourth alternative is rejected, we are dealing with a statement with three nested negations, namely ¬¬(A V ¬A).41 If we read the negation-symbols as just straight truth-functional negation, both this and the negation of the third alternative turn out to be equivalent to A V ¬A, and it is obvious that this is not the conclusion Nāgārjuna wants to draw.42 I have already argued that

39. See, e.g., Schayer (1933: 93), Galloway (1989: 16), Ng (1993: 93), Tillemans (1999: 134). In some cases the equivalent form (¬A ∧ ¬¬A) is given for the fourth alternative. The reader might wonder why we expressed the fourth alternative as “not (A or not A)” rather than “not (A and not A),” i.e., as the negation of the third alternative, which would be equivalent to “A or not A.” If we look at the way the fourth alternative is formulated in the MMK, we realize that there is a considerable amount of variation which seems to allow both formalizations. We sometimes find it formulated as na abhayam “not both [the first and second alternative]” (22:11, 25:17, 25:23, 27:13), which supports the reading as “not (A and not A)” and sometimes as naiva . . . naiva . . . “not even . . ., not even . . .” (18:8, 25:15–16) or na . . . na . . . ca “not . . . and not . . .” (25:22), which seems to support the reading as “not (A or not A).” The reason for this variation is not that Nāgārjuna had problems distinguishing “and” and “or” but rather that the context makes it clear that “not (A or not A)” is intended. If we read the fourth alternative as “not (A and not A)” this interpretation leaves us with three possible ways in which it could be true: either A obtains and not-A does not A, does not obtain and not-A obtains, or A does not obtain and not-A does obtain either. Given that the first two possibilities would be inconsistent with the rejections of the first two alternatives earlier in the argument, we are left with the third possibility, which just says the same as “not (A or not A).”

40. Applying DeMorgan’s law to the fourth alternative, ¬(A V ¬A), we get (¬A ∧ ¬¬A), which, by Double Negation Elimination, is equivalent to A ∧ ¬A, i.e., the third alternative. Robinson (1967: 57) is one of the surprisingly few authors to have picked up on this very problematic issue.

41. After the relevant parts of MMK 22:11 are rearranged, it is straightforward to see the three stacked occurrences of negation it contains (here highlighted in bold): na vaktavyam na abhayam šīnyam ašīnyam. See also 27:13.

42. It is interesting to note that the Tibetan commentarial tradition tried to avoid this difficulty by plugging in various modifiers, such as “ultimately” (don dam par) or “conventionally” (tha snyad du). If these are

the two instances of negation in such statements as MMK 18:10 should be regarded as different kinds of negation, namely that the outer had to be taken as prasajya-negation and the inner as paryudāsa-negation. Since it is evident that the negation involved in the rejection of the four alternatives is meant to be prasajya-negation,43 the rejection of the fourth alternative would then have to be read as

prasajya-¬ prasajya-¬(A V paryudāsa-¬A).

If we now assumed that prasajya-negation obeyed Double Negation Elimination, in other words that an even number of such negations cancelled each other out, this assumption would mean the rejection of the fourth alternative entailed the assertion of either A or its paryudāsa-negation, which is clearly not what Nāgārjuna wants to say. I therefore want to argue that this assumption is indeed not justified, that ¬¬A ≡ A does not hold when the negation is taken to be prasajya-negation.

It is sometimes remarked in the contemporary commentarial literature that the notion of negation at work in Madhyamaka arguments should be understood along the lines of intuitionist negation, which famously does not accept the equivalence ¬¬A ≡ A.44 It has to be kept in mind, however, that the intuitionist rejection of ¬¬A ≡ A, which went hand in hand with a negation of the Law of the Excluded Middle, was motivated by very specific mathematical reasons. Since the negation symbol was interpreted as expressing our ability to give a reductio ad absurdum of the mathematical proposition to be negated, while the assertion of an unnegated proposition was taken to imply our ability to provide a proof of that proposition, ¬¬A could not entail A, because a demonstration abbreviated by U and C, respectively, the tetralemma is taken to assert that all of the following should be rejected:

1. UA
2. C¬A
3. UA ∧¬¬¬A
4. ¬UA ∧¬¬¬A

It it thereby denied that A obtains ultimately, that it conventionally fails to obtain, that it both ultimately obtains and conventionally fails to obtain, and finally that it neither ultimately obtains nor conventionally fails to obtain. Tillemans (1999: 134–137) gives an example (slightly more intricate than the above) of such an interpolation procedure from Se ra rje btsun chos kyi rgyal mtshan’s skabs dang po’i spyi. It is evident that on this account the third and fourth alternatives are not in turn equivalent to the Law of the Excluded Middle, without requiring us to assume that negation behaves non-classically. While the dGe lugs interpolation procedure here (as well as in other contexts) provides a very interesting interpretation of the Madhyamaka arguments there seems to be no textual evidence that Nāgārjuna expected qualifications of the above kind to be supplied when interpreting the tetralemma.

43. As stressed in PP 13:5.

44. For an exposition of intuitionist logic, see Heyting (1971). The intuitionist reading was considered by Chi (1969: 162–163) and Staal (1975: 47).
that we cannot disprove a proposition does not amount to a proof of that proposition. It is obvious that these problems in the ontology of mathematics were not problems Nāgārjuna was concerned with. What speaks furthermore against the intuitionist interpretation of Madhyamaka negation is the fact that while it is sensible to argue that prasājya-negation does not obey \( \neg \neg A \equiv A \) in order to make sense of the tetralemma, I do not think Nāgārjuna also rejected the Law of the Excluded Middle for it. For even if some property (or indeed all properties) should turn out to be inapplicable to an object, the prasājye negation of the ascription of the property to the object should be affirmed. And given that Nāgārjuna does not express any doubts about our ability to check whether properties are in fact applicable to objects in general, it appears to be unproblematic to affirm that \( A \lor \neg A \) holds for prasājya-negation, that is, to assume for any property and any object, that either this property is applicable to the object or it is not.

There does not seem to be any direct textual evidence in Indian Madhyamaka literature stating that prasājya-negation does not obey \( \neg \neg A \equiv A \). If we consider one example of a presupposition-cancelling prasājya-negation discussed above, namely the case of exclusion negation, it seems plausible that \( \neg \neg A \equiv A \) does not hold for it. Remember that when we use choice negation to negate a statement such as “The apple is red,” we are merely saying of the apple that it is of course the set of red things itself. In brief, we just say that the apple is red.

Exclusion negation, on the other hand, would be used to negate a statement such as “The number seven is yellow,” thereby claiming that yellowness not just fails to be true of the number seven, but is indeed not applicable to it. If we then iterate this exclusion negation, we say that it is not applicable to assert of the number seven that the property of yellowness is not applicable to it—and whatever this means, it seems quite distinct from saying that the number seven is yellow.

Be this as it may, I think there is a more elegant way to dissolve the above difficulty of iterated negations. This involves the notion of illocutionary negation. The underlying idea is that propositions expressing a content can be prefixed by illocutionary operators forming assertions, commands, requests, promises, and so on. Thus, ascribing the property of being open to the window produces the assertion “The window is open” when prefixed by the assertion operator, the command “Open the window!” when prefixed by the command operator, and so on. It is now important for our purposes to note that when one of these results is negated, it makes a difference whether or not the negation operator is within the scope of the illocutionary force operator, that is, whether we say “I promise to open the window” or “I do not promise to open the window.” Similarly there is a distinction between “I assert that the window is not open” and “I do not assert that the window is open”—the first involving familiar propositional negation, the second illocutionary negation.

There are various reasons why someone may employ illocutionary negation. One example is obviously when the proposition to be negated carries an unwelcome presupposition which propositional negation would preserve. Thus we will be happy to say “I do not assert that the number seven is yellow” (presumably together with “I do not assert that the number seven is not yellow”), but not “I assert that the number seven is not yellow.” In other words, one motivation for using illocutionary negation is the desire to employ a prasājya- rather than paryūdāsa-negation because we want to reject a particular presupposition made by the sentence to be negated. Note, however, that this is not the only reason why we might use illocutionary negation. Another obvious candidate is lack of evidence. We might say “I do not assert that the continuum hypothesis is true” in order to indicate that we have no good evidence either way’in
this case the presupposition-cancelling consideration involved when discussing the color of the number seven does not come into play. We do not want to say that the continuum hypothesis is not the kind of thing that could be true or false. A third case in which we might want to apply illocutionary negation to a proposition \( A \) is one in which \( A \) is not part of our language and we have no way of translating it. In this case we would not want to assert \( A \), because we do not know which situation would make it true and which would make it false. It is therefore evident that illocutionary negation is a more general notion than presupposition-cancelling \( \text{prasajya} \)-negation: it incorporates it, but it subsumes other considerations as well.

It is now tempting to interpret the tetralemma as asserting that illocutionary negation\(^52\) should be applied to the following positions:

1. \( A \)
2. \( \neg A \)
3. \( A \) and \( \neg A \)
4. I do not assert (\( A \) or \( \neg A \))

Here the negation-operator \( \neg \) is to be read again as \( \text{prasajya} \)-negation. The focus of our attention is of course the negation of the fourth alternative, which now features two illocutionary negations in a row:

I do not assert that I do not assert that (\( A \) or \( \neg A \)).

The advantage of replacing the \( \text{prasajya} \)-negations in this way by illocutionary negations is that it allows us to see straightaway that the two negations do not reduce to an unnegated proposition, that is, that \( \neg \neg A \equiv A \) does not hold. Declining to assert a proposition that in turn asserts that we decline to assert a third proposition does not amount to an assertion of this third proposition. Tillemans has argued that the illocutionary reading of \( \text{prasajya} \)-negation in the context of the tetralemma has the “serious philosophical drawback” that it gives the impression of the Mādhyamika’s refusing to adopt either a positive or negative position on some subject-matter. This impression would be misleading.

52. It is interesting to note that in the Pali sources we sometimes find the four alternatives denied by the phrase ‘\( \text{na h’ idam} \), “it is not so” (for example in the \textit{An’ guttara Nikāya} [Morris 1888: 2:163]), and sometimes by the phrase ‘\( \text{mā h’ evam} \), “do not say so” (\textit{Sam. yutta Nikāya} [Feer 1888: 2:19–20]). Some have argued that there is a semantic distinction between the two uses and that “it is not so” is employed when the predicate in question is applicable to the situation discussed but giving an affirmative answer to any one alternative would be misleading, while as “do not say so” is used where the predicate is not applicable to the situation (Jayatilleke [963: 346], Gunaratne [1980: 231–231], Bharadwaja [1984: 312–313]). This second use corresponds to the illocutionary negation just introduced; interestingly enough, this is employed in the passage from the \textit{Sam. yutta Nikāya} just cited to reject the four alternatives claiming that suffering is produced by oneself, by others, by both, or by neither. However, since it is apparent that Nāgārjuna and his commentators wanted to assert “\textit{some form} of a negated proposition”\(^53\) when setting out the arguments for rejecting the different parts of the tetralemma.

Fortunately this problem can be easily dissolving. While the application of illocutionary negation to some proposition entails that we want to be “uncommitted to the truth or falsity of it,”\(^54\) it also means that we want to assert a negative proposition when speaking \textit{about} the proposition concerned. For example, we might want to deny that there is enough evidence available for deciding it, or that we can translate it into our language, or that it carries with it a presupposition we want to assert. It is of course this last justification for using illocutionary negation that the Mādhyamika wants to adopt, because he wants to deny the existence of svabhāva presupposed by the four positions in the tetralemma. It is therefore unproblematic to assert that the Mādhyamika declines to assert any of the four positions while still “asserting \textit{some form} of negated proposition.”

A further objection one might make at this point is that the interpretation in terms of illocutionary negation is not able to account for one important feature we would want to ascribe to the tetralemma, namely that the four alternatives are logically disjoint. It is evident that if I refuse to assert some proposition \( A \) (that is, negate it illocutionarily) doing so will entail that I also refuse to assert its conjunction with some other proposition. It could not be the case that I refused to assert the continuum hypothesis but would be happy to assert both the continuum hypothesis and Riemann’s hypothesis. But in this case the illocutionary negation of the first alternative will imply that of the third, so that any distinct argument for rejecting the third possibility would be superfluous. This argument of course depends on the assumption that the “and” in the formulation of the third alternative behaves like the truth-functional operator of conjunction, so that the third alternative entails the first. We will argue shortly that this is not generally the case. To do so, however, we must first have a closer look at the status of the third alternative itself.

\subsection*{4.3.2. The Status of the Third Alternative}

An important problem in interpreting the tetralemma is connected with the rejection of the third alternative, which asserts the applicability of a property and its \( \text{prasajya} \)-negation. Why, we might well ask, does Nāgārjuna think we

have to consider this contradictory option as well, as if it constituted a real possibility?\textsuperscript{55}

Robinson suggests that a way of dealing with this problem is to interpret the four alternatives not in a propositional but in a quantificational way.\textsuperscript{56} If $F$ is the property under consideration, the four alternatives to be rejected become:

1. Everything is $F$.
2. Everything is not $F$.
3. Something is $F$ and something is not $F$.
4. \textbf{Not:} Something is $F$ or something is not $F$.

Here all negations are \textit{paryudāsa}, apart from the one in the fourth alternative, set in boldface, which is a \textit{prasajya}—negation.

It is evident that when formulated in this way, the third alternative is ambiguous, depending on whether we take the two occurrences of “something” to refer to the same object. If we take them to refer to different objects, the third alternative is not any more problematic than saying that chess pieces are both white and not white, where this statement is to mean that some are white and some are not white. This interpretation, however, does not fit well with the employment of the tetralemma by Nāgārjuna. His aim is to investigate the applicability of various concepts (such as emptiness, permanence, finitude, etc.) to objects. If the third alternative was taken to mean “the concept under discussion is applicable to some objects and not to others,” this would not be an argumentationally interesting option for Nāgārjuna, because the application of the concept to some objects and its non-application to the others would then have to be investigated individually in any case. On this interpretation the third alternative would merely present a complex statement of two argumentative options which Nāgārjuna will want to investigate separately. Richard Robinson remarks:\textsuperscript{57}

It is a striking feature of the \textit{Stanzas} that all predicates seem to be asserted totally of the whole subject. Existential quantifications are denied because the discussion is concerned, not with the denial or affirmation of commonsense assertions such as “Some fuel is burning and some is not,” but with the concepts of own-being and essence. What pertains to part of an essence must of course pertain to the whole essence.

\textsuperscript{55} There are clear cases of \textit{paryudāsa}-negation in the MMK where Nāgārjuna assumes the Law of Noncontradiction (e.g. 7:30 and 8:7). The third contradictory alternative should therefore not constitute a genuine possibility. See also Robinson (1967: 50–52); Ruegg (1977: 48–49); Galloway (1989: 19–22).

\textsuperscript{56} Robinson (1967: 57–58).

\textsuperscript{57} Robinson (1967: 54). See also Gunaratne (1986: 225–226).

To put it briefly, given that Nāgārjuna wants to inquire into the applicability of particular concepts to objects \textit{toute court}, we should also consider the four alternatives as giving alternative ways of the application of particular concepts to objects \textit{toute court}, rather than as implying their application to some objects but not to others.

We therefore have to interpret the two occurrences of “something” as pertaining to the same object, that is, the third alternative claims that “something is $F$ and the same something is not $F$.” Whether this statement is contradictory depends on how we understand the application of the properties $F$ and not $F$. For example, it is straightforward to assert that a chess board is black and not black if we mean by this that some parts of it are black and others are not black. On this reading the contradiction is avoided by relativizing of the two properties involved to different mereological parts. The same result can be achieved by relativizing to different respects or perspectives under which the object is considered, for example if we assign different utilities to an alternative in a decision problem under different descriptions.\textsuperscript{58}

To see that these kinds of relativizing interpretations are present in Nāgārjuna, it is instructive to look at the reasons by which the third alternative is generally rejected. Here we can distinguish two varieties. In the first case Nāgārjuna rejects it because its claim is as contradictory as asserting of a single object that it is wholly black and not black. For example, we read in MMK 25:14:\textsuperscript{59}

- \textbf{How could nirvāṇa exist and not exist? Like light and darkness these two [i.e., existence and non-existence] cannot be at the same place.}\textsuperscript{60}

In the second case Nāgārjuna rejects the third alternative since it would combine the difficulties facing the first and second alternatives (which have already been rejected earlier in the argument). This point is clearly made by Candrakīrti:\textsuperscript{61}

- \textbf{Things do not originate both from [themselves and from other things]. This is because the problems stated for both positions [i.e., the first and second alternative] will arise together one by one.}\textsuperscript{58}

\textsuperscript{58} The \textit{Dīgha Nikāya} (1:31) asserts that the world is both not existent and not non-existent—the former because it ceases, the latter because it arises. See Jayatilleke (1967: 79); Robinson (1969: 75); Gunaratne (1980: 221).

\textsuperscript{59} Further examples can be found in 7:30, 8:7, and 27:28.

\textsuperscript{60} \textit{abhaved abhāvo bhāvaś ca nirvāṇam ubhayaṃkatham. / tayor abhāvo hy ekatra prakāśaṃ atamasar iva.}

\textsuperscript{61} \textit{dvābhāyāmpañi nopajīvante bhāvāḥ. ubhayaśabbhitadosaprasan’ gait prayayam upādāsāmarthāyāc ca. PP 38:1–2, Ruegg (2002: 73).} Candrakīrti makes the same point when commenting on MMK 12:9. See Schayer (1931: 20).
It is clear from this way of rejecting the third alternative that it is here not understood to be contradictory but that Candrakīrti takes it to be perfectly possible that something could be caused partly by itself and partly by other things. (One straightforward account of this idea consists in conceiving of an effect as a potential in a cause that is actualized only given the right background conditions.)

This possibility is rejected because the presence of these two ways of causing would imply the difficulties of both causation from itself and causation from other things, both of which Nāgārjuna has already rejected as unsatisfactory.

We therefore have to conclude that Nāgārjuna applies the argumentative figure of the tetralemma both to cases where he takes a concept and its paryudāsa-negation (i.e., the conjuncts of the third alternative) to be contradictory, as in the first case just mentioned, and also to cases where he considers it to be possible that both can be applied to an object, as in the second case.

Obviously it is only in the second case that recourse to the tetralemma would have been strictly necessary, since in the first case a consideration of two alternatives (of the concept and its paryudāsa-negation) would have been sufficient, given that both of them together are regarded as contradictory anyway. We might perhaps explain the fact that Nāgārjuna uses the four alternatives nevertheless on rhetorical rather than on logical grounds. If it was assumed that all four alternatives of the tetralemma applied to a particular notion were positions actually propounded by some school of thought, it would be heuristically useful, if not logically necessary, to go through all of them individually, even if doing so included an alternative that the Mādhyamika regarded as logically contradictory.

But if we thus regard the second case as the domain of the tetralemma proper (and the first only as a rhetorical expansion of the rejection of two alternatives), it is clear that in the tetralemma proper the third alternative does not entail the first. Consider the case of the tetralemma applied to causation. Here the first alternative claims that things are caused exclusively by themselves, the second that they are caused exclusively by others. The third alternative constitutes a compromise between the first and second: it says that things are partly self-caused and partly caused by other objects. But this possibility obviously does not imply the first alternative, any more than saying that a chess board is partly black and partly white implies that it is black all over. For this reason the illocutionary negation of the first alternative also does not imply that of the third, since the third is not a truth-functional conjunction of the first alternative and something else.

We should also note that according to the quantificational reading given above, the third and fourth alternatives are logically distinct, since number 3 says that some objects instantiate both the property F and its complement, whereas number 4 says that neither is in fact instantiated. Finally, as we conceive of the initial two negations in the negated fourth alternative as illocutionary negations, so that they do not cancel each other out, the rejection of the fourth alternative is not equivalent to “Something is F or something is not F.”

It therefore becomes evident that what Nāgārjuna wants to say in MMK 22:11 is that the following four alternatives should all be rejected.

1. “Empty” should be asserted of all objects.
2. “Empty” should be denied (in a paryudāsa fashion) of all objects.
3. “Empty” should be asserted of some objects and should be paryudāsa-denied of the same objects.
4. Not: “Empty” should be asserted of some objects, or “empty” should be paryudāsa-denied of the same objects.

Nāgārjuna’s usual argumentative procedure (as we will see) is to argue that each of the four alternatives leads to an absurd consequence, so that the whole set is to be rejected. In this case, however, he does not discuss the four alternatives individually but dispatches them with a single argument, namely by saying that all assertions listed in the four alternatives “are only names.” Nāgārjuna is therefore making a semantic point: while it is of course true for the Mādhyamika that every right-minded person should assert the emptiness of all objects, this should not be done by assuming that there are some objectively existent objects out there, referred to by a similarly objective reference.

65. The boldface “not” indicates illocutionary negation.
66. Since Nāgārjuna does not give reasons for the rejection of the four alternatives individually, we cannot say whether he would have wanted to reject the third alternative because he considers it to be contradictory (“nothing can be empty and not empty at the same time”) or because it would combine the difficulties inherent in the first two alternatives. It is certainly conceivable that someone might adopt the third alternative by arguing that phenomena are empty in some respects but not in others; for example, one might claim that they are empty insofar as they are causally produced, but not empty insofar as they exist independently of us.

63. These two ways of rejecting the third alternative are also distinguished in Ghose (1987: 296–297). He also mentions a third way in which the third alternative is rejected because “it attributes to the conjunction some properties which are common to both the conjuncts.” As an example Ghose discusses verse 25:12 from the MMK, where Nāgārjuna claims that “if nirvāṇa was both existent and non-existent, it would not be non-independent, as it would depend on both.” Nāgārjuna here refutes this alternative not by not saying that it is contradictory for something to be both existent and non-existent, but by arguing that since existence and non-existence both presuppose dependence, nirvāṇa would be dependent, which it is not. However, it is evident that this is just an example of the second way of rejecting the third alternative too.
64. See note 77 to this chapter.
relation, and that these objects have the property of emptiness.\textsuperscript{67} Statements of emptiness should not be understood according to the standard semantic theory.\textsuperscript{68} With such a theory in mind, it is neither correct to say that all things are empty or to say that they all lack emptiness, or that some are both empty and not empty, or that the predicate “empty” is not applicable to objects at all, in the same way as the predicate “yellow” is not applicable to numbers.

Before we leave the subject of the quantificational interpretation of the tetralemma, it might be useful to have a brief look at the analysis presented by Tillemans in an appendix to (1990). There the four alternatives are formalized as

1. \(\neg(\exists x)(Fx)\).
2. \(\neg(\exists x)(\neg Fx)\).
3. \(\neg(\exists x)(Fx \land \neg Fx)\).
4. \(\neg(\exists x)(\neg Fx \land \neg \neg Fx)\).

Tillemans argues that it is straightforward to make sense of the simultaneous rejection of all four positions if we assume that there is no \(x\), that is, if the domain of quantification is empty.\textsuperscript{69} While this reading makes superfluous the distinction between different kinds of negation in the tetralemma, it also has a number of problems. On the one hand there is the familiar difficulty that the third and fourth possibilities come out as logically equivalent. On the other hand (as was noted by Tillemans himself), this interpretation implies that the Mādhyamika would also have to accept all four positions of the tetralemma, since the corresponding universal statements are also true in the empty domain. But there is no textual evidence in Mādhyamaka literature that the four positions of the tetralemma are simultaneously to be rejected and accepted.\textsuperscript{70}

Tillemans continues to argue that quantified statements accepted by the Mādhyamika are generally to be interpreted substitutionally rather than referentially. Interpreted referentially, the statement “All \(x\) are \(F\)” means that there is some set of objects such that every single one of them is \(F\). Interpreted substitutionally, it means that for every name substituted for “\(x\)” in “\(Fx\)” we get a true statement. The Mādhyamika can therefore “use the world’s language to communicate about whichever day-to-day affairs the world concerns itself with: his

\textsuperscript{67} It should therefore be noted that the last three alternatives are in a way more deficient than the first one. For a Mādhyamika the first assertion would be true if interpreted according to the right semantics, whereas the final three would still have to be rejected, because even with the right semantics they would be false.

\textsuperscript{68} Garfield (1995: 280).

\textsuperscript{69} Tillemans (1990: 75).

\textsuperscript{70} As we will see in the final section of this chapter, there are cases in which all four positions are affirmed (the so-called positive tetralemma). This, however, serves a very different purpose from the negative tetralemma.

\textsuperscript{67} It should therefore be noted that the last three alternatives are in a way more deficient than the first one. For a Mādhyamika the first assertion would be true if interpreted according to the right semantics, whereas the final three would still have to be rejected, because even with the right semantics they would be false.

\textsuperscript{68} Garfield (1995: 280).

\textsuperscript{69} Tillemans (1990: 75).

\textsuperscript{70} As we will see in the final section of this chapter, there are cases in which all four positions are affirmed (the so-called positive tetralemma). This, however, serves a very different purpose from the negative tetralemma.

\textsuperscript{68} With such a theory in mind, it is neither correct to say that all things are empty or to say that they all lack emptiness, or that some are both empty and not empty, or that the predicate “empty” is not applicable to objects at all, in the same way as the predicate “yellow” is not applicable to numbers.

\textsuperscript{69} Tillemans wants to spell out in this way, is concerned with two different ways of interpreting the ontological status of objects, or, to put it differently, with two different accounts of what it means for a statement to be true. At the conventional level a statement is true if what it says is indeed the case, that is, if there are objects taken to exist with svabhāva which are related in the necessary ways. At the absolute level, however, the notion of svabhāva is to be found to be deficient and svabhāva is seen to be nonexistent. But both the referential and the substitutional interpretation of a statement can be read either way: the objects quantified over can be seen as either existing with svabhāva or being empty; similarly the truth of the sentences featuring in the substitutional interpretation can be regarded as being made true by situations regarded at the level of conventional truth or by situations regarded at the level of absolute truth, which are then seen as empty. It seems to be that what is important from the Madhyamaka perspective is not so much whether a quantified statement is read referentially or substitutionally, but the way in which the notions of “object” and “true statement” contained in these readings are spelled out.

4.3.3. Rejection of Four Alternatives: The Case of Relations

All of the examples of the rejection of four alternatives discussed concerned the rejection of one-place properties, such as emptiness, permanence, or finitude. Nevertheless, some of Nāgārjuna’s most famous arguments in fact involve the rejection of four alternatives concerning relations.

A very clear example of the employment of the tetralemma in this way can be found in the twelfth chapter of the MMK. Nāgārjuna starts out by listing the four possibilities available when the concept of causation is applied to suffering: Some say that suffering is caused by itself, or by something else, or from both, or that it arises in an uncaused way.\textsuperscript{73}

Now we could interpret this statement along the lines of the tetralemma concerning properties by just regarding it as being about the property of self-causation.

\textsuperscript{71} Tillemans (1990: 75).

\textsuperscript{72} Garfield (1996: 6) is of course correct in pointing out that “empty of” denotes a relation. But what Nāgārjuna has in mind is clearly emptiness of inherent existence, which is a one-place property.

\textsuperscript{73} svayamkṛtam, parakṛtam, dvābhāyamkṛtam ahetukam. / duh, kham ity eka icchanti. . . .
rather than about the relation of causation. The above verse would then amount to a rejection of the following four alternatives:

1. Everything is self-caused.
2. Everything is not self-caused (i.e., is caused by others).
3. Something is self-caused and (the same) something is not self-caused.
4. Not: Something is self-caused or (the same) something is not self-caused.

While this move allows us to treat the forms of the tetralemma dealing with properties and relations as exactly parallel, I think a more natural way of reading the above argument would run as follows.

The essential difference between a property and a relation is that a property (such as yellowness) will divide the set of objects it is applicable to (spatiotemporal objects) into two subsets, those that have the property (such as lemons, bananas, curry powder, and so on) and those that lack it (such as strawberries, apples, chili powder, and so on). A relation, however, divides the set of objects it is applicable to into pairs of objects from the set that are related by the relation. There are various ways in which this set of pairs can be made up; it can consist

1. exclusively of pairs containing the same object twice, or
2. exclusively of pairs containing two different objects, or
3. of both pairs of identical and distinct objects, or finally
4. it can consist of nothing at all, that is, it can be completely empty.

Which of these possibilities obtains determines the way in which the objects in the set are related by the relation. If, for example, we consider the “loves” relation and a set of human beings, then in the case of number 1 we are dealing with a set of egoists, where people only ever love themselves, in number 2 we deal with a set of altruists, where people only ever love other people, in number 3 we have the (normal) situation of some people loving both themselves and others, and in number 4 we have an emotional vacuum: nobody loves anybody, neither themselves nor others.

If we thus wanted to argue for the deficiency of the concept of a particular relation along the lines of the above argument, we would consider the four possibilities of that relation: relating an object to itself, relating an object to something that is not itself (where the notion of negation involved is again of the paryudāsa-kind), relating an object both to itself and to other objects, and relating it neither to itself nor to other objects, that is, relating it to nothing at all. If we succeed in showing all four possibilities to be unsatisfactory, we can then deny all four alternatives by a prasajya-negation and thus apply illocutionary negation to them. In this way we demonstrate the inapplicability of the concept of the relation to the objects under consideration.

We can therefore read the first verse from the twelfth chapter of the MMK as arguing that if it makes sense to use the concept of causation when talking about suffering at all, it would have to be the case that causation related suffering either to itself (i.e., that it was self-caused) or to another thing, or to both, or that suffering was not causally related to anything. As is hardly surprising, Nāgārjuna sets out to argue that the concept of causation is not applicable in this context, and he ends the verse by stating the conclusion to be established:

To consider [suffering] as produced is not appropriate.

In the remainder of the chapter Nāgārjuna then sets out to refute each of these possibilities. Verse 2 attempts to refute suffering’s self-production, verses 3 to 8 production from another, and verse 9 the final two possibilities. Since this chapter is concerned primarily with the argumentational mechanics of the tetralemma we can disregard the precise contents of these arguments. It is, however, important to note the generalization stated in the final verse of the chapter:

Not only does suffering not exist in any of the four possible ways described, but no other external entity exists in these ways either.

Thus, apart from being a specific argument about the suitability of using the concept of causation to talk about suffering, Nāgārjuna takes the contents of this chapter also to be an argument-schema, that is a framework which can

74. For the sake of simplicity we will confine ourselves here to two-place relations.

75. It is important not to confuse this fourth case with the inapplicability of a relation to a set: in a set of people nobody may stand in the “loves” relation, and nobody will stand in the “is the square root of” relation. But it is at least possible that people could stand in the former relation, whereas it is impossible that they stand in the latter.

76. . . . tac ca kāryam. na yujyate.

77. It is sometimes argued (e.g., in Wayman [1977: 11–12]) that the four possibilities concerning causation mentioned in MMK 12:1, and more generally in 1:1, represent the views of four different Indian schools of philosophy. Self-causation is ascribed to the Sāṃkhyas (Murty [1955: 168–169]), causation by others to the theory of divine causation expounded in the Vedas and Brāhmaṇas (see Kalupahana [1975: 5] for some other examples of what he calls “external causation”), causation by itself and by others to the Naiyāyikas and Vaiśeṣikas (Dasgupta [1942: 1:320]), King (1999: 208), and finally absence of causation to the Lokāyatas (Kalupahana [1975: 25]). This last identification is denied by Schayer (1931: n. 16, 20–21), who argues that the view of the Cārvākas denies causality only in the context of karma but not in all causal determinations, because they assert that things are determined by their intrinsic nature (svabhāva).

78. na kevalam. hi duh. kasya cāturvidhyam. na vidyate / bāhyānām api bhāvānām. cāturvidhyam. na vidyate.
be employed to demonstrate the deficiency of other concepts when referring to external entities.  

4.4. Affirming Four Alternatives: The Positive Tetrалemma

As we saw, the tetrалemma is usually employed in Madhyamaka argumentation to provide an enumeration of four exclusive and exhaustive logical alternatives all of which are then shown to be deficient and thus rejected. There is, however, one notorious exception in Nāgārjuna’s writings, in verse 18:8 of the MMK. There Nāgārjuna seems to affirm all four alternatives by claiming that

All is so, or all is not so, both so and not so, neither so nor not so. This is the Buddha’s teaching.

In the commentarial tradition following Candrakīrti this verse is generally understood as indicating the graded nature of Buddha’s teaching (anusāsana). The idea is that “all is so” is taught to ordinary disciples in order to convince them of Buddha’s insight into the nature of phenomena. “All is not so” is taught subsequently to inform them about the impermanence and momentariness of all phenomena. “All is both so and not so” is taught to show that what appears to be genuine and substantial from an ordinary perspective might not do so from the perspective of a Buddha’s disciple. Finally, “All is neither so nor not so” is taught to show that neither of these terms is applicable to reality in ultimate terms, in the same way, Candrakīrti observes, as the adjectives “pale” or “dark-skinned” are not applicable to the son of a barren woman.

Neither of the four alternatives is therefore to be rejected in this context. They rather form an ascending series of views of increasing conceptual sophistication, each suitable for the purposes of a specific audience.

79. As Robinson (1967: 50) points out, Nāgārjuna frequently indicates that his arguments function as patterns into which other terms can be substituted. For examples from the MMK see 3:8, 16:7, 19:4, and 10:15.  
80. sarvam, tathyam, na vá tathyam. tathyam, cátathyam eva ca / naiva/tathyam. naya/tathyam etad buddhānuśāsanam.
82. PP 371:11–12.
83. Robinson (1967: 56–57), Ng (1993: 94–99), Ruegg (1977: 6–7, 63–64, n. 71) argues that since each alternative improves on the preceding one and even the fourth alternative is intended only for the “scarcely obscured,” all four alternatives should nevertheless be rejected. (This interpretation is criticized by Wood (1994: 140–146). Even if we accept Ruegg’s position, it is clear that the four alternatives given in 18:8 are quite distinct from all the other uses in Nāgārjuna’s writings, since in all other instances all four alternatives are negated and are not even assigned a heuristic value.  

Garfield offers a different interpretation based on the dGe lugs interpolation procedure already discussed here. Here the conflict between the four alternatives is dissolved not by relativizing them to different perspectives, as Candrakīrti does, but by adding the modifiers “ultimately” and “conventionally.” The passage is thus interpreted as saying that

1. Everything is conventionally real.
2. Nothing is ultimately real.
3. Everything is both conventionally real and ultimately unreal.
4. Nothing is either conventionally unreal or ultimately real.

While Garfield does not deny that the conception of graded teaching is something “with which Nāgārjuna would agree,” he argues that such a discussion seems “out of place” in the argumentative context of chapter 18. The reason is not quite clear. After all, the sixth verse asserts that Buddha taught the teachings of self, non-self, and neither self nor non-self, and Garfield himself asserts that these three were meant to counteract specific wrong conceptions of the self in the mind of the listeners. On the whole the reading of the positive tetrалemma in terms of graded teaching seems to be more satisfactory, because it does not commit us to making any additions to the text itself.

I hope these remarks have made it plausible that to understand the catuṣkotī it is essential to keep apart the different kinds of nested negations involved. In this way it is possible to see that the four alternatives of the tetrалemma are logically independent, as well as to understand how the rejection of the four alternatives (as illocutionary negations based on a presupposition failure) fits in with Nāgārjuna’s general philosophical attempt to demonstrate the nonexistence of svabhāva.

Compared with some accounts in the contemporary commentarial literature, the interpretation presented in this chapter is logically very conservative. It does not involve anything beyond the resources found in classical logic and in particular gets by without rejecting the Law of the Excluded Middle or adopting a paraconsistent logic. While I think there are some aspects of Nāgārjuna’s works (for example, the notoriously complex issue of the emptiness of emptiness) that can perhaps be fruitfully interpreted by reference to some variety of dialetheism, such as the one put forward by Priest and Garfield, this approach does not apply to the methodological foundations of Nāgārjuna’s arguments in the catuṣkotī. These can be explained entirely within the framework of classical logic.

Conclusion: Nāgārjuna’s Philosophical Project

This chapter is to serve three purposes. First I will summarize the main philosophical conclusions for which Nāgārjuna argues. The arguments in support of these have been analyzed in detail in the preceding chapters, so I will confine myself to a concise statement of the conclusions themselves. Second, I set out to show that these are not just isolated philosophical statements but fit together as a unified philosophical theory which is Nāgārjuna’s Madhyamaka. Finally I will assess some systematic aspects of the emerging theory, its theoretical appeal as well as some connections with contemporary philosophical debates.

10.1. Metaphysics

Nāgārjuna’s central metaphysical thesis is the denial of any kind of substance whatsoever. Here substance, or more precisely, svabhāva when understood as substance-svabhāva, is taken to be any object that exists objectively, the existence and qualities of which are independent of other objects, human concepts, or interests, something which is, to use a later Tibetan turn of phrase, “established from its own side.”¹ To appreciate how radical this thesis is, we just have to remind ourselves to what extent many of the ways of investigating

¹. rang ngos nas grub pa.
Nāgārjuna agrees with the Abhidharma analysis that any substance, any object that exists by its own intrinsic nature, has to be atomic, for if it consisted of parts it would be existentially dependent on them. But as the Ābhidharmika’s mereological argument aims to demonstrate, a partite entity cannot be regarded as ultimately real. It is rather to be conceived of as a conceptual construction from (or as a superimposition on) its parts, which may be ultimately real, presupposing that they do not depend for their existence on anything else. It is obvious that the demand for the atomicity of substance cannot just be restricted to mereological atomicity but must include temporal atomicity as well. For in the same way in which we can argue that a house is conceptually constructed from its proper mereological parts, such as bricks, beams, tiles, and so on, we have to regard it as being constructed as a collection of temporal moments, namely from its temporal part which exists now, from that in the next second, from the one after that, and so forth.

We now already see the problem for the causal relation between substances on the horizon, since causation is a relation which is necessarily located in time. We will recall that Nāgārjuna considered the different possible temporal relations between cause and effect and rejected them all as problematic when dealing with substances. Clearly it makes no sense to assume that the cause exists only after the effect, for once the effect exists there is no further necessity for the cause to bring it about. It might initially seem more plausible to assume that the cause exists first and is succeeded by the effect. But after a moment’s thought it becomes apparent that within the presentist framework in which the argument is set up this idea means that only one relatum of the causal relation will exist at one time, for while the cause exists, the effect, being future, does not yet exist, and after it has come about, the cause, being past, exists no longer. In this case it should be apparent that we cannot deal with a relation between two substances or ultimately real things, since one of the relata is provided only by our expectation (or our memory in the retrospective case). On this understanding, causation cannot be regarded as a relation between items “which are there anyway” but has to be seen as essentially dependent on the mind, which supplies it with the missing relatum. The final possibility, that cause and effect are simultaneous, does not fare much better, because discussions of causation commonly accept that it makes not much sense to speak of two simultaneous events (such as the rising and falling of the opposite ends of a perfectly rigid see-saw) in terms of cause and effect, for each argument we could produce for one event being the cause can equally well be used to claim that it is the effect.

Even if we could get around this difficulty somehow, we would certainly not want to say that simultaneity of cause and effect is something to be found in all instances of causation.

At this point in the argument we might want to accuse Nāgārjuna of having neglected a crucial case: that of the cause and effect overlapping. After all, this is the most straightforward model of causation we have. When we see a potter make a pot, we see the pot during the process of its production, at a time when both the cause (the pot-making potter) and the effect (the pot being produced) exist. So cause and effect appear to be able to exist as temporally overlapping events. But the problem is that this commonsense model of causal production cannot be used to account for the causation between substances. Because substances are temporally atomic, they cannot undergo a temporally thick process of gradual emergence we observe in objects that are not part of the fundamental furniture of the world (such as pots). At any particular moment either there is such a substance or there is not. For this reason the three temporal relations examined by Nāgārjuna are really all there is for substances to which the concept of gradual emergence does not apply. Assuming we accept Nāgārjuna’s argument that causation is conceptually constructed, it is clear how this can be employed against the Ābhidharmika’s view of primary existents. For even though the Ābhidharmika can accept that primary existents possessing svabhāva can be dependent on causes and conditions, they should not be dependent on the human mind. But then the existence of one primary existent should not be dependent on another one by a relation that is minddependent. So assuming these objects are connected by causation, they cannot be primary (dravya) but must be secondary existents (prajñāpāti).

10.1.2. Change

It is an obvious fact that the world around us is always changing. Now a substance, an object that has its properties intrinsically, could not change with regard to these properties, for in this case the existence of the properties would rely on the causes and conditions that brought them about, so these properties would turn out to be dependent after all. For the same reason, substances could

4. As noted by Bhāviveka in his commentary on MMK 1:3 in the Prajñāpradīpa (Pandeya [1988–1989: 26]).

5. Siderits (2003: 131), (2004: 418, n. 30) notes that during a process of gradual production such as that of a pot, we find that there will always be a stage at which it is vague whether or not the pot has been produced yet. According to some views of pots, the produced entity is already a pot, but not according to others. This is unproblematic, as we accept that there are different ways of conceptualizing pots. But we would not countenance a similar vagueness in the case of substances, for here it should precisely not depend on our conceptualizing whether a particular substance exists or not. This should be something settled by the world on its own. Arguing in this way provides us with another reason why we would not want to accept that the causal relation between substances could be conceived of in terms of a temporal overlap.
not come into existence or go out of existence; besides being changeless they also have to be eternal. For the defender of substances it is therefore necessary to regard all the change we observe as a mere difference in rearrangement of the most fundamental constituents of the world. Successive states of the world are just permutations of what is there all the time. An immediate consequence of this view is that the fundamental particles physics studies do not qualify as substances. For suppose such a particle is destroyed in a collision close to the speed of light, and at the same time a burst of energy is detected in the close vicinity. Now either we say that the particle went out of existence and the energy burst came into existence more or less at the same time, in which case neither can be a substance for the reasons just noted, or we say that the particle changed into the energy burst, in which case we have to explain this change in terms of some yet more fundamental elements the rearrangements of which could appear either as a fundamental particle or as a burst of energy. The fundamental constituents of the physical world thereby recede further and further.

We might want to argue that we are acquainted with some eternal, unchanging entities, such as mathematical objects. Of course this argument depends heavily on our ontology of mathematics, and looking at the contemporary discussion, Platonism does not seem to be a position attracting the most convincing defenses. But even if we assume Platonism is true, we would have to argue in addition that all the objects of our experience can be reduced to abstract objects if we follow the downward chain of dependencies for a long enough time. How a complex arrangement of objects without spatio-temporal location could turn out to have such a location in itself would be only one of the startling questions such a theory would have to answer. It therefore appears that the permanent entities we are acquainted with are not quite the right kind of thing for playing the role of fundamental parts of reality, while those that seem to be the right kind of thing (such as the fundamental particles of physics) cannot be regarded as fundamental as long as they are subject to change as well. Once more the notion of objects existing with a bare particular seems to have slipped our conceptual grasp.

10.1.3. Substances and Their Properties

Another difficulty arising if we assume there are substances is the relationship between such substances and their properties. We cannot just conceive of some substance as an individual instantiating properties. For the sake of illustration (and using an Indian example), suppose that water-atoms are substances and that their only intrinsic property is wetness. Now what is the individual in which wetness inheres? Since it is not characterized by any other properties, it must be some kind of propertyless bare particular. What makes it a bare particular? Given that we are dealing with substances here, it had better not depend on some other object. But if it is a bare particular by svabhāva and being a bare particular is therefore its intrinsic nature we are in the same situation as we were with the water-atoms and their wetness. For now we can ask what the individual is in which being a bare particular inheres, and then we are well on our way to an infinite regress. Note that this problem does not go away if we feel uneasy about the property “being a bare particular” and do not want to admit it. For we have to assume that the individual has some determinate nature due to which it is a bearer of its properties and the difficulty will just reappear with whatever we take such a nature to be.

It does not help much if we conceive of substances as particularized properties or tropes instead, for then it is unclear how we can individuate one wetness-trope from another. We cannot differentiate them according to the individuals in which they inhere, because we have just rejected the existence of individuals at the level of substances. We cannot say that this wetness-trope is different from that because they turn up in different samples of water, since the samples of water are just collections of tropes. Of course we could try to tell apart the various trope-substances by the collections in which they occur (or, more precisely, by which other tropes they are related to via a higher-order compresence-trope). The difficulty for this solution is that it introduces dependence-relations via the back door, for every trope will existentially depend on being connected to just these other tropes via a compresence-trope—we cannot take a trope and “move” it to another collection. Since we want to conceive of substances as entities that are not existentially dependent on one another, this approach inevitably introduces a certain tension into our system.

It thus becomes apparent that once more a conceptual scheme which can be more or less straightforwardly applied to non-substances breaks down once we attempt to analyze the supposedly foundational objects of our world in terms of it. This happened in the case of causation and can be observed once again in the case of individuals and properties. While there is no difficulty in analyzing the relation between a potter and a pot in terms of cause and effect, various problems ensue if we try to transpose this procedure to an analysis of the relation of substances. Similarly while the analysis of a red apple into an individual and the property it instantiates is at least on the face of it
unproblematic, the same analysis cannot be carried out when one is dealing with ultimate existents.

After the criticism of the distinction between individuals and properties in Nāgārjuna’s discussion of motion, this problem should not be too much of a surprise. There he attempted to show that the distinction between individuals and properties is not one that exists independent of our conceptualizations. Just as the talk about the “property” instantiated by a thin individual (such as a clap of thunder) had to be explained in terms of a single feature seen in two different ways—as constitutive and as instantiating—in the same way talk of the properties of ordinary thick individuals (such as Farinelli) could be seen to be equally a reflection of the division of their features into constitutive and instantiating properties, something that is just a reflection of our pragmatic concerns in conceptualizing the individual in question, but not a reflection of its intrinsic nature.

We could now imagine that somebody would argue as follows. Nāgārjuna has shown that we run into difficulties if we attempt to analyze the fundamental constituents of reality, objects that have an intrinsic nature in terms of such notions as cause and effect, change, or individual and property. Such objects cannot stand in causal relationships, they do not change, they cannot be thought of as bearers of properties. The most fundamental bits of reality therefore fail to be grasped by the familiar conceptual schemes we employ in our everyday lives in order to get around in the world. We therefore have to assume that substances are acausal, atemporal (since for them there is neither beginning, end, nor any change in between) entities which cannot be regarded as objects having properties. Given the fundamentality of the above conceptual schemes to our cognitive lives, this statement seems to be nearly as good as saying that the nature of substances transcends conceptualization. Since the fundamental constituents of reality cannot be grasped by concepts that are our nearest and dearest, they constitute an ineffable reality to which we have no cognitive access.

This interpretation was favored by some Indian commentators. A particularly well-known example can be found in Dharmapāla’s debate with Bhāviveka.\(^7\)

There the Yogācārīn Dharmapāla takes Bhāviveka to task for asserting that even though things exist at the conventional level, nothing exists at the ultimate level. Dharmapāla argues that it would be mistaken to assume that at the ultimate level there was no svabhāva at all, leaving the knowledge of ultimate reality without an object, like knowledge of a non-existent flower in the sky.\(^8\) It should rather be understood in terms of the Yogācārī theory of the “three natures” (trisvabhāva) by claiming that only the imagined nature (parakalpita svabhāva), the mistaken projection of things as substantial, was completely non-existent. Both the dependent nature (paratantra svabhāva)—the appearances—and the absolute nature (parinis. panna svabhāva)—the fact that the dependent nature is empty of the imagined nature—do, however, exist.\(^9\)

Moreover, the true nature of things is completely beyond concepts.\(^10\)

The difficulty with this interpretation is that if we regard the true nature of things as ineffable, we still assume that there are objects with a mindindependent\(^11\) intrinsic nature, namely that of ineffability. This position assumes that there is a way things are from their own side, by svabhāva, which is not in any way affected by us. The key difference between this kind of realism and the more familiar kind of realism which provides the background to much contemporary philosophy (and much of our everyday life) is an epistemological one. Common-or-garden realism asserts that there is a way the world is which is independent of all description, and that we can know at least a substantial part of it. Its less plain cousin agrees with the first part of the statement but holds that this state of things forever eludes our grasp. But it is clear that for Nāgārjuna neither form of realism is acceptable. The doctrine of emptiness tries to establish that there are no objects with intrinsic natures, whether they are knowable or not. The view of substances as ineffable which introduces entities with svabhāva through the back door is therefore to be firmly resisted.

A key element of the rejection of the view of ineffable substances is denying that it makes any sense to speak of objects lying beyond our conceptual frameworks, or, as Dharmapāla put it, as “inaccessible to differentiating consciousness and words” and “suspending all speech.”\(^12\) These frameworks are all we have, and if we can show that some notion is not to be subsumed under

7. See Hoornaert (2004); Tillemans (1990). For modern defenders of the ineffability thesis which do not presuppose a Yogācārī background, see, e.g., Murty (1955); Inada (1970: 24–26); Matilal (1990: 149); Mohanty (1992: 278). Interpreters who accept the ineffability thesis may or may not accept that there is a non-conceptual form of cognition through which substances can nevertheless be known.

10. Rab tu phye ba tshig dang bral ba (Hoornaert 2004: 141, n. 60).

11. We might think that because ineffability contains a reference to the conceptual frameworks we use, it is in fact a mind-dependent quality. But its dependence is only notional, not existential. Compare it with the property “is so long that it cannot be measured by any measuring-rod on earth.” If any object had this property, it would obviously not make sense to describe it in this way if our planet ceased to exist. But the annihilation of the earth would not affect its length. In the same way the ineffable nature of a substance remains the same whether or not there is anyone around trying to eff it.

them, we must not conclude that it therefore has some shadowy existence outside of the framework. To this extent our conceptual framework is to be thought of not so much as a map of a country, but as a set of rules for a game. If a traveler brings us news from a city in some far-off land which we cannot find on our map, we conclude (if we regard the traveler to be truthful) that it must be located somewhere outside of the area covered by our map. But if somebody told us he had found a new opening gambit in chess but that this could not be written down using the familiar notation, we would be justified in being puzzled. After all, the notation allows us to describe all the legal moves of chess (as well as some illegal ones), so how could something that is part of a game not be constructed in accordance with the rules of the game? In this case we would conclude not that because of the limited nature of the expressive resources of chess notation this gambit was beyond its grasp, but rather that there was no such gambit. It is not that there are some objects within the grasp of our cognitive capacities as well as some beyond them, but rather that the very concept of an object is something established by these capacities. It is not that parts of the world might not correspond to our linguistic and conceptual frameworks but that the idea of a structure of reality independent of these practices is incoherent. 13 Our ability to grasp the world by concepts is acquired by our knowledge of language (or, as some might argue, is the very same thing as that knowledge). Language is a public phenomenon, an ability we display in interaction with other speakers. We would therefore want to claim that we can be taken to have understood the meaning of a word or to have mastered some concept only if we can give a public display of its use or application. A concept for which we could not give the application conditions even in principle, where we could not even tell in the abstract what kinds of objects would fall under it, is not a concept at all. But this seems to be exactly the situation with the concept of substance when seen as ineffable. Because what falls under this concept is understood to transcend all our conceptual resources, we would be necessarily unable to apply this concept to anything. It is for this reason that the Mādhyamika claims that the concept of an ineffable substance is necessarily empty. And once this concept is ruled out, the only remaining conclusion to draw from Nāgārjuna’s criticism of substance is that there is no such thing, not even an ineffable one.

The metaphysical anti-realism defended by Nāgārjuna is not just of historical but also of considerable systematic interest. One reason is its wide scope. While most of the discussion of anti-realism we find in the contemporary literature is concerned with particular local phenomena (such as mathematical objects or moral values), the Mādhyamika’s anti-realism takes the form of a general anti-foundationalism which does not just deny the objective, intrinsic, and mind-independent existence of some class of objects, but rejects such existence for any kinds of objects that we could regard as the most fundamental building-blocks of the world. A second interesting point is the fact that Nāgārjuna does not regard his metaphysical theory to imply that anything is up for grabs. That there are no substantially existent entities does not entail that there are no selves responsible for their actions, no distinction between the moral worth of different actions, no difference between true and false theories. The Mādhyamika therefore has to come up with an account of convention which is solid enough to ground our ethical, epistemic, and semantic practices but not so rigid as to reintroduce some sort of realism regarding any of these.

10.2. Personal Identity

Nāgārjuna’s rejection of entities existing by svabhāva is not restricted to the study of the external world around us. At least as important as refuting the existence of fundamental substances which provide the basis for a world independent of human interests and concerns is the refutation of a substantial self, which constitutes the fixed point around which our internal world revolves. Such a substantial self is an essentially unchanging entity, distinct from our physical body and psychological states, which unifies our sensory input and mental life and acts as a foundation of our agenthood in the world. Nāgārjuna wants to replace this prima facie plausible and compelling view of a self, which, however, he claims to be mistaken, by a conception of the self as a set of causally interconnected physical and psychological events. He sets out to account for the fact that we normally do not see ourselves in this way by arguing that this set of events is usually under the misapprehension of its own properties: it sees itself as a substantial self, even though it is not.

It is interesting to note that this alternative view of the self presented here (which, to be sure, is not a Madhyamaka speciality but widely shared between different Buddhist traditions), despite its intuitive implausibility, finds a surprising amount of support in recent research on cognitive science. Of particular interest in this context is the so-called narrative view of the self, a theory that has been explored in detail by Daniel Dennett, 14 who also presents supporting evidence from our current knowledge of how the brain works. One of Dennett’s

13. Candrakīrti makes this point criticizing the Yogācāra view of the mind as self-illuminating (svapprakāśa). See Siderits (1989: 243). This, however, does not imply that these frameworks would not be susceptible to criticism or change. See Tillemans (2003: 123, n. 47).

central observations is that the processing of neurophysiologically encoded information is spread out across the entire brain. There is no place in the brain where “it all comes together,” no “Cartesian theater” where the stream of sensory information is unified into mental content and presented to consciousness. He argues that not only is there no neurophysiological analog to the self anywhere in the spatial organization of the brain, also the temporal sequence of events in the brain cannot be used as a foundation of a continuous self. Dennett shows that in certain cases the order of events as they appear in our consciousness does not line up with the temporal order of their underlying neurophysiological bases. The view of our selves as continuous, temporally extended entities therefore cannot be seen as a mere reflection of a series of events in the brain, but requires a significant deal of conceptual construction. Our subjective feelings of spatial and temporal location cannot be grounded on the spatially and temporally spread out, discontinuous series of events in the brain in a straightforward manner. Our view of the self as an essentially unchanging unifier and agent cannot be based on our biological makeup in the same way as our view of the nature of the center of gravity (another conceptual construction) of some object cannot be based on the structure of the piece of matter that occupies the space where we locate the center of gravity.

Dennett argues instead that the self is a product of our linguistic capacities. The capacity to use language is hard-wired into our brain, and once we start using language, we tell stories, including stories about ourselves which continuously create that very self. The self emerging on this theory is not the author, but the authored. Dennett notes that “our tales are spun, but for the most part we don’t spin them; they spin us. The human consciousness, and our narrative selfhood, is the product, not their source.” For this reason there is no fundamental difference between the self created by our own narrative and the selves created in works of fiction. It is not the case that the former are intrinsically more real than the latter; in fact they belong fundamentally to the same class of things (even though the fictional selves, unlike our own narrative selves, are usually not open-ended). Both are conceptual constructs produced by our regarding a narrative, our own or that in some text, as revolving around a single fixed point.

Assuming we accept the view of the self as a conceptual construction superimposed on a collection of physico-psychological events, we might still ask ourselves what the point of all this constructing is. Why do we spin these narratives which in turn cause us to misapprehend the nature of the self, thinking that there is a substantial self where in fact there is only a set of intersecting narratives? Some cognitive scientists have proposed evolutionary reasons for this phenomenon. Thomas Metzinger suggests that we should look at the human self-model as a neurocomputational weapon, a certain data structure that the brain can activate from time to time such as when you have to wake up in the morning and integrate your sensory perceptions with your motor behaviour. The ego machine just turns on its phenomenal self, and that is the moment when you come to be. To have a good self-model means to be successful in a certain environment. It starts with simple properties: you need to know how far you can jump, what your body can do, how big you are, what your boundaries are, so that you don’t start to eat your own legs, as some primitive animals may actually do, or as some psychiatrically disturbed people do.

According to this interpretation, our intuitive view of ourselves as substance-selves is to be understood as a pragmatically successful self-deception. A self-model along the lines of a substance-self allows us to respond to many tasks more quickly than would a more cumbersome one based on the notion of a process. This is the reason why this sense of the self has spread so widely, since it provides the minds who hold it with an evolutionary advantage. It thus became the dominant and most natural way to see ourselves.

Despite its popularity with cognitive scientists, the reductionist view of the self as nothing but a causally connected chain of physical and psychological events faces some obvious philosophical problems. The first problem concerns the unity of a person. It is not clear whether reductionism can actually account for the boundaries between different persons in the right way. For suppose I decide to make a sound. This means that there is a causal sequence involving a psychological event (the decision) and a physical event (my making the sound). You hear that sound and later remember it. Given that all these events are causally connected to one another, how do we draw the line between the causally connected chain which constitutes “me” and that which constitutes “you” without already presupposing the concept of a person? If we think of causally connected chains of physical and psychological events, it seems as if there is only one big network of these, without any obvious way of dividing them into

19. An interesting account of the psychological consequences of the loss of such a self-model from the first-person (!) perspective is given in Segal (1998).
persons. A second problem arises with the **rationality of prudential concern for ourselves**. We usually think that it is rational to show concern for future stages of our selves, so that, for example, we buy an umbrella today so that we don’t get wet tomorrow. Similarly arguments built around the notion of karma presuppose in the same way that we should care about what happens to us in the future. But if a person is nothing but a logical fiction built on a succession of momentary psycho-physical events, how could such a fiction exhibit prudential concern? After all, the person is never present at any particular temporal stage to function as a potential subject of such concern.

Addressing these difficulties would obviously require a long and careful discussion of the implications of a reductionist theory of persons. This will not be attempted here, for two main reasons. First of all there exists now a philosophical literature of considerable depth and sophistication dealing with issues arising from a reductionist view of persons. In Western philosophy this developed as a reaction to Derek Parfit’s influential monograph *Reasons and Persons*. This describes a reductionist view of persons which the author regards as fundamentally the same as the one found in Buddhist texts. It would be neither possible nor desirable to repeat the resulting discussion here. Second, the theory of persons described above is no position specific to Mādhyamikas, but something shared by all main Buddhist schools. A prolonged discussion of these matters would therefore take us away from the main Madhyamaka focus of this study.

At this point I would like to sketch briefly two key concepts one could use to address the problems of unity and prudential concern, based on the discussion in Siderits (2003). In dealing with the first problem, it is useful to establish the concept of a **maximally causally connected set** of psycho-physical events. This is a set which we make as large as possible while maximizing the causal connectedness of the set. For example we will include events connected with specific body parts (such as the vocal chords and the ear) only if they stand in continuous causal connection over time. While your ear-event might be causally connected to my vocal-chord event (because you hear me) and could therefore be included in the set, doing so would reduce the overall causal connectivity of the set, since over time there will be fewer causal connections between my voice and your ear than between my voice and my ear. Such sets could then be made more and more comprehensive and could be regarded as reductionist substitutes for the notion of a person.

One avenue to explore for the establishment of prudential concern is the idea that the concept of a person as a trans-temporal, non-momentary entity is a convention accepted because of its consequences. Given that there are several conventions we could have adopted (such as the convention of momentary beings without temporal extension, or the convention of one overarching mind of which everything else forms a part), the one we chose in the end must have something to recommend it. This something either might be cashed out in evolutionary terms, arguing that this person-convention just provided its bearers with the greatest survival value, or it could be given a normative justification. Here the idea is that conceptualizing a causal sequence of psycho-physical events using the concept of a person rather than some other one maximizes utility. For example, under such a conceptualization it is much less likely that minor immediate pleasures will be traded in for major future pains. Moreover, the idea of future pain could be used as a deterrent, whereas under the conception of a person as a momentary entity this idea of punishment would not have much force. This utilitarian defense of the concept of a person of course presupposes that the concept of pain (which is what is to be minimized) does not bring in persons again through the back door. But assuming this could be done, this approach seems to leave us with a sensible way of accounting for prudential concern against a reductionist background.

**10.3. Ethics**

Very little has been said here so far on Nāgārjuna’s ethical theory. Apart from the RĀ and some verses in the MMK, most of his remarks on ethics are found in such works as the *Suhr. ilekha* and the *Shes rab sdong bu*. The former text, which enjoyed considerable popularity in Tibet, presents the reader with concrete ethical advice for the layman; it stresses the importance of compassion and describes karmic consequences of various kinds of behavior. The *Shes rab dong bu*, or “Tree of Wisdom,” is a collection of aphorisms dealing with maxims for ethical behavior, drawn from the Mahābhārata, the Pañcatantra, and the

---

20. Parfit (1984: 273, 280). More recent discussions of the issues involved here can be found in Siderits (2003), particularly in chapters 2 and 3, as well as in Albahari (2006).

While these works contain a considerable amount of discussion of ethical topics, I have chosen not to analyze them in detail but to confine my treatment to the remarks in this section. To see why, we have to note that we can distinguish three different kinds of ethical statements in Madhyamaka texts. First of all there are the ethical pronouncements made by a Madhyamika such as Nāgārjuna as part of an exposition of the Buddhist doctrine which he, as a Buddhist, incorporates into his teachings. These will include remarks about the relative consequences of meritorious and non-meritorious actions, attachment as the primary cause of suffering, the importance of compassion, and so on. Second, we find an ethical discussion in connection with the concept of emptiness, in particular with the emptiness of persons. If there is no substantial self, we might wonder who the agent of an action or the experiencer of a result, or the subject and object of compassion, really are. The Buddhist propounder of a non-self has to give a re-interpretation of these notions without the tacit presupposition of a substantial self underlying all of them. We should note that this challenge is not one that applies specifically to the Madhyamika, but it applies to any theorist holding a non-self view in conjunction with the common Buddhist ethical view. It is thus equally a task for a Vaibhāṣika, Theravādin, or Sautrāntika to give a theoretical account of this issue. The third kind of statements deal with the specific ethical consequences of Madhyamaka views. For example, the particularly Nāgārjunian view that there is no ultimate difference between saṃsāra and nirvāṇa demands an explanation of why we should engage in meritorious rather than non-meritorious actions, or Buddhist practices in general: if there is no difference between the liberated and the non-liberated state in any case, why bother?

Most of Nāgārjuna’s ethical remarks fall into the first, and some also into the second class. Those in the first class, though interesting in the context of Nāgārjuna’s Buddhist worldview, shed relatively little light on philosophical problems, especially concerning Nāgārjuna’s most original thoughts, that is, the metaphysical and epistemological considerations which form the heart of Madhyamaka philosophy.

In the context of remarks in the second class, dealing with the relationship between ethical issues and the concept of emptiness, Nāgārjuna extends his analysis of phenomena also to such key ethical notions as pleasure and pain and notes that these too do not exist by substance-svabhāva. In the RĀ he observes:

Physical feelings of pleasure are only a lessening of pain. Perceptions [and the pleasures they produce] are made of thought, they are created only by conceptuality.

Pleasure and pain therefore cannot be treated as basic reals on which our system of ethics could be based (for example in the form of some sort of utilitarian calculus aimed at maximizing pleasure), since they exist interdependently. There could be no pleasure in the absence of pain, or vice versa. But this fact then implies that neither could exist by substance-svabhāva. Furthermore, if the extent to which a certain situation is regarded as painful or pleasurable depends on the way it is conceptualized, being painful or pleasurable is shown to be no intrinsic property of a part of the world out there, but something arising from the interaction between a conceptualizing subject and a conceptualized object.

The question of the compatibility of the emptiness of the self and the notion of karma is raised in the MMK. Nāgārjuna notes:

If an action were uncreated fear would arise of encountering something not done. . . . It would be impossible to draw a distinction between merit and demerit.

The worry here is that if there was no substantial self creating actions, there would be no way of ascribing individual actions to individual selves, since there are no such selves, but only complexes of psychophysical events. But then it may happen that one experiences the consequences of a deed that one did not do, that is, one arising from a different such complex. This would then not give us any way of differentiating actions into wholesome actions as those that have pleasant consequences, and unwholesome actions as those that have unpleasant consequences. Moreover, on the analysis in terms of psychophysical complexes the entire set of distinctions into action, agent, consequence, and experiencer of the consequence, which are of central importance for the system of Buddhist ethics disappears.

31. See also RĀ 3:50.
32. akrībhyaḥgahayamsyāt karākratam. yadi / [. . .] / pun. yapāpakṣor naiva pravibhāga ca yujyate. MMK 17:23a, 24b.
33. MMK 17:29–30.
As was already noted in chapter 7, this worry may be answered by the example of the illusion created within an illusion. The fundamental mistake of an insubstantial self to regard itself as substantial creates the concepts of agent, action, consequent, and experiencer, which then in turn bring with them the whole system of karmic interrelations. Unfortunately this belief is so fundamental that mere intellectual understanding of the non-existence of substantial selves does not stop such selves from appearing to us. In the same way, the understanding that some phenomenon is an optical illusion generally does not alter the way it appears to us, but at best how seriously we take this appearance. What is needed for the disappearance of such concepts as agent, action, consequence, and experience is the realization of the non-substantiality of the self, that is, the attainment of a cognitive shift which keeps the mistaken notion of the substantial self from arising.

Remarks dealing with the ethical repercussions of emptiness such as those just discussed are relatively rare in the works of Nāgārjuna. Analyses belonging to the third class; those dealing with the specific ethical consequences of Madhyamaka thought are virtually absent. A major issue presenting itself at this point is the question as to which extent there is fundamental relation between the Madhyamaka theory of emptiness and the ethical theory of compassion centered on the ideal of the bodhisattva. After all, it seems that a case for such an ethical theory can already be made from the perspective of the “lower schools.” If there are no substantial selves and therefore no psychological states—such as pains—essentially attached to selves, all these unpersonal pains can be regarded as equally bad, irrespective of their location. But in this case my reason for removing my own pain is not more pressing than that of removing the pain of other beings; in fact it is considerably less pressing, since the pains of other beings outnumber my own. We thus seem to be able to get relatively close to Mahāyāna ethics on the basis of Hinayāna metaphysics. So what is the distinctive advantage of the Madhyamaka theory of emptiness for establishing the ethical ideal of a bodhisattva?

There is much to be said about this question as well as others arising in the same context, but the basis of such answers in Nāgārjuna’s writings on Madhyamaka is at best implicit. The examination of these issues becomes considerably more interesting when we take into account later Madhyamaka texts which address questions dealing with the distinctive Madhyamaka consequences for ethics explicitly and in greater detail.\(^{35}\) We can imagine a variety of reasons

\(^{34}\) For example Siderits (2003: chapter 9).

\(^{35}\) An obvious source in this context is the BCA. See Williams (1998).

10.4. Epistemology

Nāgārjuna’s account of epistemology is supposed to fulfill a purpose both at the object-level and at the meta-level. At the object-level, means of knowledge and their objects are just another set of central concepts which have to be investigated as entities potentially existing with svabhāva. At the meta-level, Nāgārjuna’s theory of epistemology is supposed to present the theoretical background of his own account of emptiness. Since the theory of emptiness is something we are supposed to acquire knowledge of, it is essential to get clear about the means by which we are supposed to do so, and indeed about what our object of knowledge consists of in this case.

These two projects are inherently interconnected, for according to the standard Nyāya theory of epistemology Nāgārjuna encountered, knowledge is acquired by use of a set of procedures (such as perception or inference) the nature of which is to produce knowledge and which convey information about a set of objective, mind-independent individuals which are the bearers of specific qualities. But a theory that thus presupposed the existence of objects of knowledge with distinct natures which the means of knowledge could adequately represent could hardly be used as a basis for knowing emptiness, for it presupposes exactly what the theory of emptiness denies.

A substantial part of Nāgārjuna’s epistemological discussion is therefore dedicated to a criticism of the standard Nyāya theory of knowledge. Nāgārjuna sets out to establish that nothing can be regarded as intrinsically a means or object of knowledge. Means of knowledge and their objects have to be mutually established: the means of knowledge establishes the object by giving us cognitive access to it, and our successful interaction with the object establishes the means of knowledge as a trustworthy route to the object. Something will
therefore be classified as a means or object of knowledge not because of its intrinsic nature, but because it is regarded as such once a reflective equilibrium has been reached. We use beliefs about the nature of the object in order to test our hypotheses concerning the means of acquiring such beliefs; these hypotheses are then in turn used to assess our view of the nature of the object.

The reason why this approach could not lead to an establishment of the means of knowledge in the way the Naiyāyika wants is that a different initial set of beliefs could have led to a different reflective equilibrium as a result. But given that each would have led to a different view of reliable means of cognition and of the objects known, we would not be able to determine which of the two faithfully reflects the nature of the means and objects of cognition. Assuming that establishing a reflective equilibrium is the only way of arriving at an account of the means and objects of cognition, it is therefore impossible to establish the true nature of either.

This criticism of the Nyāya position has been considered to be unsatisfactory by Mark Siderits in recent work. Siderits’s main point is that it relies on an internalist conception of knowledge according to which the justification for a knowledge-claim also has to be known to the subject. For the internalist it is not just sufficient to respond to a sceptical threat by demonstrating that the subject is justified, it also has to know to be justified. It is thus not sufficient that the method of the reflective equilibrium might as a matter of fact supply us with the right account of means of knowledge and their objects, but we also have to know that it is the right account. But given the fact that there can be several such equilibria, the internalist fails to be justified. Siderits argues that the Nyāya view of veridical cognition as the product of a reliable causal process cannot be subsumed under such internalism; indeed it is a typical externalist position where the justification for knowing something is located outside of the body of the subject’s knowledge. But if this is the case then the Madhyamika’s criticism loses its force, for it is now based on an assumption—namely epistemic internalism— which its opponent does not share.

The force of this criticism is undermined to a certain extent by the fact that the identification of the opponent Nāgārjuna criticizes in individual arguments is notoriously difficult to establish by any but systematic reasons. While the heavy influence of Nyāya thought on the epistemological discussion in the VV is obvious, this fact does not necessarily entail that the opponent addressed in the passages dealing with the mutual establishment of means and objects of knowledge is a Naiyāyika as well. We might equally use Siderits’s argument to claim that the implicit internalist position entails that he cannot have been one, since the criticism would not have applied to him otherwise.

While such questions are impossible to decide on the basis of the textual evidence available to us, it is interesting to consider what kind of argument Nāgārjuna could have used in his criticism of an externalist position. Siderits makes the interesting suggestion of employing Nāgārjuna’s analysis of causation, which does not feature much in the VV and is not put to any epistemological use in the MMK. As the reader will recall, Nāgārjuna argues that causation, far from being a mind-independent relation which establishes objective connections between phenomena, is itself intricately bound up with conceptualization. As was argued above, we cannot conceive of a causal relation between two entities without a substantial mental contribution. If we plausibly assume that the cause precedes the effect, then at the time of the existence of the cause, when the effect does not yet exist, our mind will have to supply the missing relatum in our expectation. Moreover, it is not just the causal relation that cannot be regarded as mind-independent, since it also plays an essential part in the construction of objects. This is so because the very establishment of miscellaneous collections of entities as unified items called “cause” (or “causal field”) and “effect” could not proceed without the notion of causation in the first place. Causation cannot be regarded as a relation connecting items which are “there anyway” in a mind-independent way.

But now it is clear that if this criticism goes through, then causation cannot be made to bear the epistemological weight the Naiyāyika wants it to bear, for the externalist regards causation as a guarantor transmitting features of the object to perception in a reliable way because the nature of the causing object will determine the nature of the perception which is the effect. As the Madhyamika has argued, however, causation is itself conceptually constructed. A reliable means of cognition which incorporates causation as a central element therefore has to be conceptually constructed in the same way. There is therefore no way in which we can regard it as providing us with accurate knowledge of an objectively existent world independent of human conceptual practices.

Nāgārjuna therefore argues for an epistemology in which nothing is intrinsically a means or an object of knowledge. And if nothing is intrinsically a means of knowledge, there is also nothing that could function as such a means in any context; it is only against a specific background that it could fulfill such

38. VV 46–48.
a role. Such an epistemology is able to provide a background for the knowledge of emptiness, since means and objects of knowledge are no longer regarded as being means and objects of knowledge intrinsically. Means of knowledge are such means only in specific contexts, and they are not supposed to adequately reflect the properties that objects have from their own side, but provide the basis of successful interaction with them. The theory of emptiness therefore no longer contradicts the epistemology on the basis of which it is to be known.

10.5. Language and Truth

As was mentioned earlier, there exists no fully formed Madhyamaka theory of language or truth in Nāgārjuna’s extant writings. This omission does not mean, however, that his works do not give us a fairly good indication of what his views on some of the key questions within this area were.

First of all, it is apparent that the Madhyamaka theory of emptiness is not compatible with the idea of a “ready-made world,” that is, of a world that exists independent of human interests and concerns and already shows a particular kind of structuring which our structured language could then set out to reflect. If nothing exists with substance-svabhāva, nothing in the world could exist from its own side and nothing could bear a structure that is intrinsic to it rather than something ascribed to it from the outside.

Moreover, the Mādhyamika will reject the classic correspondence account of truth, according to which the truth of a statement is grounded in a similarity of structure between a statement and the bit of the world to which it refers. This also entails a rejection of the corresponding view of how language works, namely that our sentences manage to connect with the world via a set of objectively existent structural similarities. The main reason for this rejection is that the Mādhyamika cannot find any sufficiently substantial relation that would allow us to bind together world and word at the most fundamental level. The most plausible candidate for linking words and their referents is the causal relation, such as by using it to construct a causal chain from an “initial baptism” to our present use of the term. But as Nāgārjuna has argued in detail, the causal relation itself is conceptually constructed. But if causation cannot be regarded as a relation that functions objectively, independent of the concepts we employ, then it can hardly be regarded as a mind-independent way of founding the relationship between language and the world.40

An alternative account which the Mādhyamika might want to adopt conceives of truth not in terms of correspondence with an exterior reality but rather in terms of assertability conditions. In this case a statement is regarded as true if conditions obtain which warrant our asserting the statement. What makes the statement that water is wet true is not a structural correspondence between it and a fact about water, but rather the fact that we have something that justifies us in making this statement. What this justification consists in depends on the further details of our theory of truth; it might be based on facts about empirical observation, about coherence with other beliefs, about pragmatic success, and so forth. This view of course implies that there could not be any truths that are in principle beyond our ability to verify them. This is so because we could never have a warrant for asserting such statements, and the existence of such a warrant is precisely what we consider the truth of the statements to consist in. Such statements would have to be regarded as lacking a truth-value. This kind of denial of verification-transcendent truths in turn agrees very well with Nāgārjuna’s contextualist epistemology. For if nothing is intrinsically a means of knowledge, nothing can be intrinsically beyond the grasp of such means of knowledge either. Because what constitutes a means of knowledge is context-dependent, that a certain truth cannot be accessed by some means of knowledge is context-dependent too. There is no context-independent concept of knowledge we could use to form the idea of a truth that lies beyond all epistemic contexts.

According to the Madhyamaka view of truth, there can be no such thing as ultimate truth, a theory describing how things really are, independent of our interests and conceptual resources employed in describing it. All one is left with is conventional truth, truth that consists in agreement with commonly accepted practices and conventions. These are the truths that are arrived at when we view the world through our linguistically formed conceptual framework. But we should be wary of denigrating these conventions as a distorting device which incorporates our specific interests and concerns. The very notion of “distortion” presupposes that there is a world untainted by conceptuality out there (even if our minds can never reach it) which is crooked and bent to fit our cognitive grasp. But precisely this notion of a “way things really are” is argued by the Mādhyamika to be incoherent. There is no way of investigating the world apart from our linguistic and conceptual practices, if only because these practices generate the notion of the “world” and of the “objects” in it in the first place. To speak of conventional reality as distorted is therefore highly misleading, unless all we want to say is that our way of investigating the world is inextricably bound up with the linguistic and conceptual framework we happen to employ.

There are two worries one might have with the rejection of
the notion of an ultimate truth. First of all one might think
that progress in human inquiry requires that we question
what we now believe to be truths and perhaps replace them
by other beliefs. Even a cursory acquaintance with the
history of science will show that we are where we are now
only through a persistent process of replacing beliefs we
once held to be true but no longer do. But it seems hard to
explain what our justification for this shift is if it is not
trying to bring our beliefs into greater accordance with the
way things are. All we ever seem to be dealing with
according to the Madhyamaka view is a purely immanent
notion of truth where the only kind of truth we have access
to is a reflection of conventional human practices and
agreements.

In response to this problem, the Mādhyamika might want
to make the point that it is at least sometimes advantageous
to treat truths as if they had a more than conventional
grounding, that is, as if they were not just the product of
agreement with commonly accepted practices and
conventions. This is so precisely because such practices need
improvement from time to time and because a spirit of
inquiry is facilitated more by the idea that there is a
mindindependent truth waiting to be discovered.41 The
Mādhyamika could thus argue that for pragmatic reasons we
should conceive of truths as reflections of an objective,
external reality even though we do not think that there are
any such truths in fact. We might object at this point that if
the notion of the existence of at least some verification-
transcendent truths is pragmatically useful, whoever believes
in truth as warranted assertibility then has to believe that
some truths are not conventional, since asserting this is now
supported by a warrant. But this thinking will not just turn
the anti-realist into a realist against his will, since his
embracing of non-conventional truths is dictated by purely
practical concerns: we are considerably better off if we build
our inquiries on the convenient fiction of non-conventional
truths. But they remain just that—conventional fictions; the
anti-realist does not think, as the realist does, that the
existence of such truths is in any way grounded in the way
the world is, independent of our interests and concerns.

Another worry with the Mādhyamika’s rejection of an
ultimate truth is that emptiness cannot then be regarded as
the ultimate truth either. But surely, one will argue, for the
Mādhyamika emptiness is the end-product of the correct
analysis of phenomena, and thereby indicative of the way
things really are. As was argued in section 2.1.3 of chapter 2
the theory of emptiness is not to be seen as a description of
reality as it is independent of human conceptual

and rational or ethical criticism would lose its point. The Mādhyamika could then argue that even though different cultures can have different standards none of which can be regarded as ultimately true (since there is no such thing as ultimate truth), still some standards can be seen to be better than others, for example in terms of overall coherence with our practices (which are also a part of conventional truth) or in terms of their ability to reduce pain. Siderits discusses the interesting example of the conception of the self by Prāśan’ gikas and Svātantrika writers. While for the Prāśan’ gikas the self is a mere label superimposed on the group of elements, the Svātantrika regards it as a continuous series of inner moments of consciousness which take their inner states as objects. Of course the latter do not think that the self has any degree of ultimate reality but believe that among the variety of aggregates which make up the self we can identify one candidate (i.e., that part of our mind is aware of its own psychological states) that best coheres with our cognitive practices. So while there is no “best” candidate among the entities that we might potentially identify with the self, because ultimately there is no such thing, according to the Svātantrika reading at least some candidates may be better than others.

Tillemans mentions the interesting example of the wine-taster in illustration of this point. It is generally agreed that secondary properties, and particularly olfactory and gustatory properties, do not have a mind-independent existence. If there were no human beings around, there would not be the properties of tasting sour or smelling sweet, since these are not properties existing in the objects themselves but are produced only by interaction of the objects and our sensory faculties. Nevertheless, despite this mind-dependence, we might want to argue that some ascriptions of secondary properties have more than a subjective validity. A wine-taster describing a wine as tasting acidic may be wrong, even though ultimately there is no property of tasting acidic which the wine has or lacks. Even within the realm of conventional truth we therefore do not “make it all up,” but there are ways of ranking different conventional statements in terms of better or worse, even though there is no best, or ultimately true account.

While this is an enlightening example, the case that the critic who is worried about relativism is concerned with is probably less like the case of wine and more like that of phenolthiourea. For genetic reasons this substance tastes bitter to about three-quarters of the population while it is tasteless to the rest. Now if we separated the two populations, we seem to end up with a case in which one group has no reason to criticize the other’s taste-judgment as incorrect, because ultimately there is no fact to the matter of what phenolthiourea tastes like. And in this case it seems impossible to rank one taste-judgment as conventionally better or worse than another one. The only thing we could bring forward in response to this point seems to be the familiar Davidsonian observation that if such disagreement between two cultures was widespread, that is, if it did not concern just simple taste sensations but also more complex factual and moral judgments, there would be no basis for the two cultures to interact at all. Since their standards of rational justification or morality would be so different from ours, the whole notion of factual and ethical criticism would lose its meaning. We would therefore have to rely on the assumption that no two cultures that can interact would differ as radically in their conventions as illustrated by the example of phenolthiourea.

In order to understand Nāgārjuna’s project as a philosophically coherent enterprise it is useful to take into account the ethical and soteriological implications of different standards one of which might be better than another but none of which can be best in the sense of corresponding to the way reality really is. For Nāgārjuna the conception of truth supported by the way things really are presents a subtle object of clinging and thereby ultimately a source of suffering. Such clinging is not as coarse as clinging to possessions, to one’s body, or to one’s self, but it still generates a kind of attachment which in turn supports a sense of selfhood as a subject who has realized the way things really are. For the Mādhyamika, in order to become truly selfless, one has to give up the view that we can obtain anything more than conventional truths, some of which might be evaluated as better than others but none of which can constitute the last word. The resulting epistemic humility is therefore a product of considerations of selfhood and ethics seen as interlinked with considerations of truth and reality.

43. This is essentially the point argued in Davidson (1973–1974: 19): “Whether we like it or not, if we want to understand others, we must count them right in most matters.”

GOLDFIELD (Tb): Root Verses from THE FUNDAMENTAL WISDOM OF THE MIDDLE WAY

ROBINSON (Ch): The Middle Stanzas
Commentary by the Brahman Blue-eyes. Translated by Kumarajiva, Master of the Tripitaka under Yao of Ch’in.

Question: Why was this treatise composed?

Reply: There are some who say that all things arise from the god ‘Great Self-Being’. Some say that they arise from Visnu, some say that they arise from combination, some say that they arise from time, some say that they arise from the world-nature some say that they arise from transformations, some say that they arise spontaneously and some say that they arise from atoms. Because they hold to these various errors they fall into false views such as that things have no cause, or some wrong cause, that they are permanent or that they are cut off, and so on. In various ways they expound ‘I’ and ‘mine’, but they do not know the true Dharma. The Buddha, desiring to terminate all such false views and to make known the Buddha-dharma, first taught the twelve causal links in the Sravaka-Dharma; but also, for the benefit of those who have already applied themselves, who have the great mind and who are capable of receiving the profound Dharma, he expounded in the Mahayana-Dharma the characteristics of causality, namely that all dharmas neither arise nor cease, are not the same, do not differ and so on; they are utterly empty and devoid of anything which exists. As is stated in the Prajnaparamita Sutra, The Buddha told Subhuti. When a Bodhisattva is established in the seat of enlightenment, he views the twelve causal links as like the inexhaustibility of empty space’.

(1b29) After the Buddha’s decease, in the second five hundred years of the patterned Dharma, men’s faculties became dulled, they became deeply attached to all dharmas, and sought for settled, fixed characteristics in the twelve causal links, the five skandhas, the twelve avenues, the eighteen realms, and so on. They did not know the Buddha’s intention and were merely attached to words and letters. Hearing utter emptiness taught in the Mahayana-Dharma they did not know the reason for things being empty, and so conceived doubts and views, such as ‘If all things are utterly empty how can you differentiate sin and merit, karmic recompense and so on? If this were so, there would be no worldly truth and no truth of the supreme meaning’. They seized hold of the characteristic of ‘emptiness’ and produced voracious attachments, generating all sorts of errors about utter emptiness. It was for such reasons as these that the Bodhisattva Nagarjuna composed this Middle Treatise.

---

CANDRAKĪRTI COMMENTARY

Prasannapadā – Lucid Exposition

Candrakīrti’s Salutation to Nagarjuna

After making my obeisance to Nagarjuna, who was born of the ocean of wisdom of the perfectly enlightened one and who rose above the realm of dualities;

who compassionately brought to light the hidden truth of the treasury of Buddhism in Buddha’s sense;

who, by the intensity of his insight, consumes the views of his opponents as though they were fuel, and burns up the darkness in the minds of men;

whose utterances of incomparable wisdom, like a shower of arrows, disperse utterly the adversaries of life;

whose words reign majestically over the three realms of the world and over Buddhists and gods as well;

After making obeisance I shall expound the verses of his treatise in correct, comprehensible statements, which will be free of vain argument, and lucid.

---

Concern, Method and Assumptions of the Middle Way Philosophy [Chapter I]

Origin, subject-matter and ultimate concern of Nagarjuna’s treatise

The great treatise we are to discuss is the one beginning “Not of themselves, nor from another, nor from both...” (fn 1 commencement of the first kārikā of Nagarjuna’s treatise.)

We have to ask what is the origin, what the subject-matter and what the ultimate concern of this great treatise. In the Madhyamakavatara (fn 2 another work of Candrakīrti) it was stated that the wisdom of a perfectly realized one has its origin in an initial vow of dedication issuing from universal compassion and graced with comprehension going beyond all duality. In this sense Nagarjuna, knowing unerringly how to teach transcendent insight (fn 3 Prajnaparamita, the consummate awareness of the truth of things.), developed this treatise out of compassion and for the enlightenment of others. So much can be said about its origin. ‘To command the hostile affections and to inure against
the vicissitudes of life: a genuine treatise has a teaching that is a stronghold. These two qualities are not found in any other treatises.’

Nagarjuna himself gives us a glimpse of the subject-matter and ultimate concern of the exhaustive treatise we are to discuss. With perfect and unerring clarity, having risen to a lofty height of mind, and desiring to honour, by a treatise, the supreme teacher, the perfectly realized one who is inseparable from the existence and truth of such a lofty height of mind, he says

Neither perishing nor arising in time, neither terminable nor eternal,

Neither self-identical nor variant in form, neither coming nor going;

Such is the true way of things (fn 4 pratitya-samutpada – Traditionally ‘dependent origination’. In Nagarjuna’s hands this term comes to mean non-dependent non-origination, that is, the absence of being in things), the serene coming to rest of the manifold of named things,

As taught by the perfectly enlightened one whom I honour as the best of all teachers. (fn 5 This verse, which is given again below, appears to be the dedication of Nagarjuna’s treatise.)

The true way of things, as characterized by the eight terms, ‘neither perishing nor arising’ and so on, is the subject-matter of this treatise.

The ultimate concern of the treatise is clearly stated to be nirvāṇa: the serene coming to rest of the manifold of all named things (sarvaprapancopasama).

The salutation is given in the words ‘I honour the best of all teachers.’

So much for the meaning of these two verses as a whole. The meaning of each term will now be analysed. ‘Perishing’ means annihilation, the utter perishing of every moment. ‘Arising’ means origination, the emergence of self-existent things. ‘Terminable’ means terminating, the disruption of a series. ‘Eternal’ means permanent, endurance through all time. ‘Self-identical’ means to be one thing, to be unspecifiable, to be undifferentiable. ‘Variant in form’ means to be specifiable, to be differentiable. ‘Coming’ means the very moving toward, it is the arriving at a proximate place of what was in a remote place. ‘Going’ is the very moving from, it is the movement to a remote place of what is in a proximate place.

The term pratitya-samutpada

The root i means motion; the preposition prati means arrival or attainment. But the addition of a preposition alters the meaning of the root. ‘A verbal root is forced, by the addition of a preposition, to alter its meaning even as the sweet waters of the Ganges on emptying into the ocean.’ So, in this case, the word pratitya, as gerund, means ‘attained’ in the sense of ‘dependent’ or ‘relative’. Again, the verbal root pad [to go, to fall] preceded by the preposition samut [out of] means to arise or to become manifest. Samutpada, then, has the meaning ‘to arise’ or ‘to become manifest’. The full meaning of the term pratitya-samutpada is therefore the arising, or becoming manifest of things (bhava) in relation to or dependent on causal conditions.

There are others who hold that the term means the arising of things which vanish in the moment. This is bad etymology and cannot explain all uses of the term in the sutras (fn 6 Putatively the discourses of Buddha) and in the Abhidharma (fn 7 Commentaries and expositions of the early sutras). Bhavaviveka (fn 8 An earlier (c. 550 AD) commentator of Nagarjuna’s treatise. He represents a rival and relentlessly attacked sub-school of Madhyamika, the svatantrika school.) attacks both this interpretation and our own. If, he says, ‘to be dependent on’ or ‘to be relative to’ means there are two separate things, then there can be no origination, because the one thing must already have arisen before it can be dependent on, or relative to, the second. This, however, is agreed to, and so is no objection to our view. Bhavaviveka adds that the term pratitya-samutpada consists of two parts because it refers to the conditional statement ‘if this exists, that will arise’ (fn 9 Putative formulation of Buddha. Cf. Kindred Sayings, vol. 2, p. 23, Pali Text Society, Translation Series, Luzac, London, 1952.). This is erroneous: the term has merely two etymological parts. Again, he says the term is a mere conventional expression, a metaphor. But Nagarjuna insists that the meaning of the entire term ‘dependent origination’ derives from its parts: ‘whatever arises in dependence on something else does not arise in truth’. Bhavaviveka, however, gives an account which is the same as our own, in saying ‘the long exists in dependence on the short, so far as there is the short, relative to the long’. Thus he accepts what he had criticized as false, which does not make sense. But enough of this disputation.

The illustrious one showed so clearly that things arise in dependence on causal conditions and he rejected the idea that origination could be without
cause or from one cause or from a variety of causes, or that no things whatsoever exist, at any time, in any place, having arisen of themselves, from another, from both or without cause. (fn 14 In paraphrase: ‘No things whatsoever exist, having arisen spontaneously from self-generation, or from what is other than themselves, from both these sources or at random, from no cause at all.’)

In this kārikā ‘at any time’ means ‘ever’, the expression ‘in any place’ means ‘anywhere at all’, the expression ‘whatsoever’ is equivalent to ‘at all’. The formulation therefore is, ‘Not as arisen of themselves do any things at all exist, ever, anywhere at all.’ The other three assertions make sense in the same way.

Controversy concerning Madhyamika method

Someone may object that one asserting ‘Things do not arise of themselves (svatah)’ is committed, against his will, to the conclusion ‘Things arise from what is other than themselves (paratathā).’ One is not so committed, however, because this negation is not intended to imply an affirmation. We will repudiate equally the view that origination is from what is other, and for the same reason for which origination from self is not possible. What that reason is can be ascertained from the Madhyamakavatara ‘Therefore, if something, of teaching of the only perfectly realized one; he looked upon all false doctrines as the idle chatter of foolish people and expressed his surpassing reverence by calling the illustrious one ‘the best of all teachers’.

In the dedication ‘perishing’ is repudiated first. This makes it clear that there is no basis for a fixed order of succession between origination and perishing. Nagarjuna will say later (fn 13 XI, 3. Not included in this translation) ‘If birth came first and old age and death later then birth would be free of old age and death and the deathless would be born.’ So it is not a fixed rule that what arises is prior and what perishes is subsequent.

The first kārikā

Nagarjuna will now undertake to expound that dependent origination which is characterized as ‘non-perishing’ and so on. He takes up, first of all, the repudiation (pratisedha) of ‘arising’ knowing that, if it is repudiated, ‘perishing’ and the other characteristics are more readily repudiated.

When other schools reflect on arising they think of it either as spontaneous, or as from another, or from both, or at random. Nagarjuna says that all these conceptions are, on reflection, unintelligible (nopapadyate).

1 No things whatsoever exist, at any time, in any place, having arisen of themselves, from another, from both or without cause.

That Nagarjuna’s primary intention is to expound the nature of dependent origination as we have characterized it, is indicated by the dedication.

Neither perishing nor arising in time, neither terminable nor eternal,

Neither self-identical nor variant in form, neither coming nor going;

Such is the true way of things, the serene coming to rest of the manifold of named things,

As taught by the perfectly enlightened one whom I honour as the best of all teachers.

Nagarjuna, through his understanding of dependent origination as we have described it, that is, as the way things are truly, discerned the unerring nature of dependent origination (samvrtam svarupam) of delusive everyday things (samvrtanam padarthanam) is revealed as it really is. Dependent origination is nothing but the coming to rest of the manifold of named things, and so on. He takes up, first of all, the characteristic ‘perishing’ and so on do not hold for dependent origination, as the way things are truly, Nagarjuna will expound throughout the whole of this treatise.

Though the characteristics of dependent origination, as the way things are truly, are endless, these eight have been chosen primarily for purposes of argumentation. When dependent origination is seen by the wise (arya) as it truly is because the manifold of named things (prapanca) — the duality of name and what is named, and so on — has ceased utterly, the manifold of named things comes to rest in it. Nagarjuna holds that dependent origination is nothing else but the coming to rest of the manifold of named things. When the everyday mind and its contents are no longer active, the subject and object of everyday transactions (vyavahara) having faded out because the turmoil of origination, decay, and death has been left behind completely, that is final beatitude. (fn 12 This paragraph anticipates the conclusion reached in the ‘Nirvāṇa’ chapter.)

That Nagarjuna’s primary intention is to expound the nature of dependent origination as we have characterized it, is indicated by the dedication.

Neither perishing nor arising in time, neither terminable nor eternal,

Neither self-identical nor variant in form, neither coming nor going;

Such is the true way of things, the serene coming to rest of the manifold of named things,

As taught by the perfectly enlightened one whom I honour as the best of all teachers.

Nagarjuna, through his understanding of dependent origination as we have described it, that is, as the way things are truly, discerned the unerring
Whatever kind, has arisen there can be no point at all in a subsequent birth of this birth: it would be nonsense.' (VI, 8)

Indeed, Buddhapalita (fn 15 An earlier (c. 500 AD?) commentator on Nagarjuna's treatise whose Candrakirti attempts to follow.) says: 'Things do not arise of themselves because such spontaneous origination would be purposeless and because it entails an absurdity. There would be no purpose in the repeated origination of things which are in existence already. That is, if something exists it would not arise again and yet there would never be a time when it was not arising.'

Bhavaviveka has pointed out syllogistic faults in Buddhapalita's statement and demands from him more than an exposure of the untenability of the opponent's argument. But Buddhapalita, in arguing against the Samkhya (fn 16 The oldest of the Indian schools of philosophy; the proponent of the theory of spontaneous generation, i.e. that the effect is contained in the cause.) in this matter is not obliged, as a Madhyamika, to do this. It is meaningless for a Madhyamika, because he cannot accept his opponent's premises, to propound a self-contained argument (svatantra anumana) from his own point of view (svatathal). As Aryadeva (fn 17 Catuhcatsaka, XVI, 24. Aryadeva was an immediate follower of Nagarjuna.) expresses it, 'If one makes no claim that something is, or is not, or is not both, it will take a very long time to refute him.'

And Nagarjuna says in the Vigrahavyavartani (fn 18 The 'Refutation of Objections, a logical work of Nagarjuna, written later than the present treatise. These verses are 29 and 30.), 'If I were to advance any thesis whatsoever, that in itself would be a fault; but I advance no thesis and so cannot be faulted.' 'If, through the means of valid knowledge I cognized any object at all, 1 would affirm or deny its existence; but as I do not do this I am not culpable.'

Bhavaviveka should not, therefore, require Buddhapalita to establish his own argument against the Samkhya claim that the effect pre-existed in the cause and is therefore self-generated.

But Bhavaviveka may be saying that though the Madhyamikas do not establish any thesis by examples and reasons and adduce no self-contained arguments and so are unable to prove the repudiation of spontaneous generation and to show that the adversary's argument is inconclusive on grounds acceptable to both; none the less, in being obliged to show up the internal contradiction in the adversary's argument, they must do this by means of arguments which are themselves free from all faults pertaining to examples, reasons and so on. Buddhapalita, not having adduced arguments free of such errors, stands faulted.

This is not the way things are, we reply. Of course anyone making a positive assertion must establish his argument with his adversary and the latter should be persuaded to accept it. But the Madhyamika brings no reason against his adversary; he makes no use of reasons and examples but pursues his own thesis only until the adversary gives up his. He proceeds on assumptions which are not provable claims; he goes so far as to contradict himself and is not capable of convincing his opponent. This is, surely, a clearer refutation than the opponent's own thesis is not adequately established. In such a situation, what would be the purpose of attempting a refutation by superior counter-argument?

Even so Buddhapalita's comment could be expressed in a formal argument as, by implication, he gives both an example of self-origination and a reason against it. Whether we take the example of the clay and the pot or the threads and the cloth, he has shown clearly and with good reasons, that the Samkhya position, according to which the effect [pot and cloth] preexists in the cause [clay and threads] does not make sense, namely, because, if they really pre-exist, there is no sense in their arising a second time.

The adversary is bound to a conclusion which is perverse by logical necessity (prasangaviparitena). We are not so bound because we advance no thesis of our own. It is therefore impossible to invalidate any argument of ours. Our intention is fully satisfied so long as a multitude of logical faults, due to internal contradictions (prasangaviparita), descend on our adversary.

How can Buddhapalita, an unerring adherent of Nagarjuna's thought, possibly conclude anything inadvertently which would give his adversary an opening against him? If one who holds that particular things do not have self-existence exposes the logical faults in the view that they have, how can there be logical inconsequence in an argument which merely exposed logical inconsequence? Words are not like policemen on the prowl: we are not subject to their independence. On the contrary, their truth lies in their efficacy (sakti): they take their meaning from the intention of the one using them. It follows that we have merely invalidated our adversary's thesis. We need not
accept the antithesis of the logical fault we have exposed.

Nagarjuna, very especially, merely pointed out logical faults when he was demolishing the thesis of an opponent. For example: ‘There is no infinite space prior to the nature of infinite space: if it were prior to its nature it would be, illogically, without a nature.’ [MMK V.1] ‘Objects are not perceived apart from matter as their cause; matter as cause is not perceived apart from objects.’ [MMK IV.1] Again, ‘Nirvāṇa is not ontic, for then it would follow that it was characterized by decay and dissolution. For there is no ontic existent not subject to decay and dissolution.’ [MMK XXV.4]

Bhavaviveka would say ‘Of course these are terse sayings. One must develop the various reasons and consequences of the profound sayings of Nagarjuna. Why does Buddhapalita not develop his formulations in this manner? For it should be the endeavour of commentators to give syllogistic arguments.’

It is not so. Nagarjuna commented on his own Vigrahavyavartani without employing syllogistic arguments (prayogavakya). Bhavaviveka is merely exhibiting his skill in the art of dialectics. Though he claims to be a follower of the Madhyamika school he none the less advances syllogistic arguments which aim to be conclusive (svatantra). Madhyamika is a great impediment for a logician such as he would be. He accumulates fault after fault.

How is that? He has advanced the following syllogistic argument: The contents of the mind (adhyatmikany ayaatanani) do not, in higher truth (paramarthataha) arise out of themselves, because they exist already, even as pure consciousness does.

But what is the purpose of the qualification ‘in higher truth’, which he introduces? If he says it is because origination as it is understood in the everyday world cannot be denied, because, if it is, then its transcendence will not be required, as we believe it is, this does not make sense. Even in the everyday world spontaneous origination is not accepted. The sutra says ‘A sprout arising from a seed as its cause is not generated from itself nor from what is not itself, nor from both, nor at random; and it does not arise from god, from time, from atoms, from matter nor spontaneously.’ (fn 19 Cf. Siksasamuccaya, p. 213) And again, ‘The sprout of a seed is not the seed itself, being the sprout; nor is it other than the seed; yet it is not the same; it is neither perishable nor eternal, but is of the essence of things.’

And Nagarjuna will say in this treatise, ‘Whatever comes into existence dependent on something else cannot be that very thing; nor can it be wholly other either; therefore it neither perishes completely nor is it eternal.’ [MMK XVIII.10] If Bhavaviveka says that the qualification ‘in higher truth’ holds only for the opponent, that does not make sense. We do not accept an opponent’s concepts even for the everyday world. As non-Buddhists lack unerring insight into the nature of the two truths, both should be excluded if the discussion is to proceed successfully. Thus it does not make sense to introduce this qualification when referring to the argument of an opponent.

Nor does the ordinary man understand causality as spontaneous generation and therefore the qualification is useless in his case as well. He does not penetrate into the problems of origination from self or from another, that an effect is produced from a cause, and so on; he understands it simply as it appears to be. Nagarjuna himself settled the matter in this way. It is clear that this qualification is in every sense utterly pointless.

However, if Bhavaviveka introduced this distinction so that he would not repudiate origination in the everyday sense, then this would involve two fallacies, that of an argument invalid because its substance is untrue for its proponent, and that of an invalid reason (hetu) (fn 20 Cf. p. 38, ‘because they exist already’) as the basis of the argument: he does not himself accept the existence of visual perception and the other mental faculties in higher truth. If he objects that there is no fallacy because vision and the other mental faculties are facts in the everyday sense, then for whom is the qualification ‘in higher truth’ binding. Perhaps he will say that the origination of delusive everyday vision and the other mental faculties is repudiated ‘in higher truth’ as a way of specifying the kind of repudiation. If that is so he should have expressed himself in this way: ‘Visual perceptions and the other contents of the mind do not arise in higher truth.’ He did not, however. But even had he, he would still have had an invalid argument because its basis is unacceptable to the opponent: for he accepts vision and the other mental faculties as real entities but does not take them to be pragmatic terms serving everyday purposes (prajnapatisata). (fn 21 This is the Madhyamika view.) So this does not make sense.

If Bhavaviveka would reply that all philosophical dispute proceeds in spite of the parties not accepting each other’s presuppositions, this will not do. He cannot advance an independent argument about the
cause of the faculties of consciousness because just these, he, as a Madhyamika, knows do not exist.

In so far as the explicit intention is to repudiate origination utterly, one must repudiate both entities and their causes whose supposed reality is rooted in mere misbelief (viparyasa) (fn 22 i.e. false belief; cf. Chapter xvii)? This repudiation must be unconditional. Misbelief and the absence of misbelief (aviparyasa) are incompatible (bhinnatva). So long as, because of misbelief, one seizes on the unreal as real, even as the victim of an eye defect falsely perceives hairs and other things in front of the eye, how will one in the least way grasp the way things really are? However, so long as, because of the absence of misbelief, the unreal is not reified into the real, even as those with healthy eyes do not see hairs and other things in front of the eye, then how could one in the slightest perceive as real what is non-existent? To do that constitutes the delusive everyday world. Precisely this is the intention of Nagarjuna’s verse: ‘If through the means of valid knowledge I cognized any object at all I would affirm or deny its existence; but as I do not do this I am not culpable.’

In this sense, therefore, misbelief and its absence are incompatible. Therefore, as for the wise there can be no misbelief where the absence of misbelief has been established, how could the mental faculties be real entities in the false everyday world? Bhavaviveka’s argument is, thus, faulty because it uses unacceptable assumptions; further, its reason is faulty as it lacks any ground. It does not therefore confute us.

There is no analogy between the existence of the mental faculties and the impermanence of sound. Whereas there is agreement about the general nature of sound and impermanence there is no agreement about the mental faculties between those who hold them to be devoid of self-existence and those who hold them not to be so devoid, either in the everyday sense or in the higher sense. So the two instances are not the same. What has been said about the fallacy of a thesis without substance for its proponent applies equally to the fallacy of adducing ‘existence’ as the reason in an argument.

At times Bhavaviveka himself falls back on the unfoundedness of all reasons as when he repudiates causality in the ultimate sense. But if reasons are unfounded proof is impossible. It may then be objected that our own arguments are as invalid as those we attack. This is true only if one, like Bhavaviveka, advances independent arguments (svatantra anumana).

But we do not construct independent arguments. Our arguments effect the refutation of the claims of our opponents.

For example, someone claims ‘The eye sees what is other than itself.’ That will be invalidated solely by an argument which such a one accepts himself. ‘You think that the eye does not have the capacity to see itself and it is agreed that this capacity is never separated from the capacity to see what is not itself, we will urge.1 Therefore whenever there is no seeing of self, there is no seeing of what is not self either, as in the case of a jar. But the eye does not see itself, and therefore it cannot see what is not itself either.’ So there is a contradiction between not being able to see itself and seeing what is not itself, like the colour blue and such things. This contradiction is exposed by an argument based solely on the opponent’s own presuppositions. Only that much is achieved by our arguments. How can the fault referred to above be turned against our thesis? How could it have the same fault?

In short, to apply the technicalities of discursive disputation is purposeless. The Buddhas themselves, out of concern for those they were guiding, who were ignorant of logic, made their points in terms of the conventional ideas of these people themselves.

The commentary resumed

Enough of all this. Let us resume our commentary on the main work. Nor do things arise out of what is other than themselves (paratathat) because such ‘other’ does not exist. As Nagarjuna will express it later on, ‘The self-existence of things cannot be found in their causes and conditions.’ It follows that, because the ‘other’ does not exist, things cannot arise from what is other than themselves. Further, some passages from the Madhyamakavatara make it clear that origination from the ‘other’ has to be repudiated. ‘If what is other is entirely dependent on what is other, then fire could give rise to great darkness. Indeed, anything could arise from anything, and perfect otherness amounts to no cause at all.’ Buddhapalita elucidates: ‘Things do not arise from what is other than themselves, because it would follow that anything would be possible from anything.’

Bhavaviveka attacks this as being a statement which merely exposes the inner contradictions of an opponent’s argument, without advancing an independent counter-argument. (fn 23 i.e. aprasanga statement;) But we have shown that such a statement is valid and that one does not affirm the opposite of what
one denies. Nor are things born from both (fn 24 i.e. ‘self and ‘other’) taken together. The illogicality will apply to both theses taken together, as origination is incomprehensible in terms of either. Nagarjuna will say later on [MMK XII,9] ‘Afflicted existence (dukhha) could arise from two causes if it could arise from one cause.’

But things cannot arise without any cause at all. If there is no cause, there will be no means nor effect either.’ The illogicality of this will be discussed later. The illogicality is further pointed out in such verses as if the entire world were devoid of causes nothing at all could be comprehended, it would be precisely like the scent and colour of a lotus in the sky.’ (fn 25)

Madhyamakavatara, VI, 99) Buddhapalita observes, ‘Things cannot arise without cause, because that would entail that anything could arise at any time, anywhere.’

Bhavaviveka attacks this statement as well for being mere dialectics and because it implies the truth of its opposite. But these objections have been dealt with.

Further, any espousal of God and such ideas is equally unintelligible, because they cannot exist apart from the agreed conceptions used in the theses given by ourselves and our opponents. And so it has been established that there is no origination because it is not possible (asambhavat). The way things are in truth, however, characterized as neither perishing nor arising and so on, has been established.

Some may object: If, in this way, you characterize dependent origination as neither perishing nor arising and so on, what then of the words of Buddha, ‘Personal dispositions are dependent on ignorance; if ignorance comes to an end, dispositions come to an end.’ Or, ‘Personal dispositions are impermanent and belong to something which itself arises and perishes. Having come into being, they cease again; bliss is their quiescence.’ Again, ‘Whether perfectly realized ones arise or do not arise, there is one essential truth established for all things. There is one practical rule for the sustenance of beings: the fourfold nourishment. There are two factors which protect the individual: humility and justice.’ Again: ‘One attains this life (loka) coming from another: one attains another life departing from this.’ It is clear that Buddha taught dependent origination as characterized by perishability and so on. Does this not contradict your interpretation?

From such passages the characteristics of dependent origination are taken to be ‘perishing’ and so on. (fn 26 i.e. the opposite of Nagarjuna’s characterization.)

Sutras for mankind at large and sutras for the initiates

This is precisely why Nagarjuna composed this treatise on the middle way; he wanted to demonstrate the proper distinction (fn 27 The distinction between neya and nitartha is indispensable to Madhyamika’s interpretation of the mass of Buddha statements accepted as canonical. The widespread translation ‘provisional’ (neya) and ‘final’ (nitartha) truth cannot hold for Madhyamika which dispenses with the notion of propositional truth.) between those sutras which are for mankind at large (neya or) and those which are for the initiates (nitartha). The former speak of arising, perishing, and so on, as characteristics of dependent origination; they have no reference to things as they are in themselves (visayasyavabha), unsullied because the defect of primal ignorance has been dispelled. They relate, on the contrary, to the knowledge of things as bound by convention and accept the limitations of primal ignorance.

But the illustrious one has spoken of seeing the way things truly are (tattvadarshana). ‘That, o monks, is the higher truth, it does not pretend to be what it is not, it is nirvana. The realm of the compounded is not what it pretends to be and so is unreal’ and so on. Again: ‘In this world there is neither truth nor absence of untruth. Everything pretends to be what it is not; it is essentially a swindle; it is unreal; it is a conjuring display (maya); it is the babbling of a child.’

A further quotation: ‘Things are but a ball of foam; feelings but a bubble; ideas are like a mirage; personal dispositions are the stem of a banana tree; consciousness is but a conjuring display; thus has spoken the sunlike Buddha.’ (fn 28 Samyutta Nikaya’, Kindred Sayings, vol. 3, pp. 120-1.)

‘A monk, seized with vigour, analysing the elements of things day and night, mindful, perfectly gathered and aware, should make his entry into the realm of peace, the realm of bliss where all personal forces are at rest.’ ‘Because all elements of existence lack an inherent self.’ And so on.

For the one who, due to ignorance of the real meaning of Buddha’s teaching, is in doubt whether certain passages are mere teaching devices, or speak of the way things really are, as well as for the one who, due to a feeble mind, mistakes a teaching utterance intended for mankind at large for a teaching aimed at wise initiates, for both of these persons who need guidance, Nagarjuna undertook this treatise. Its purpose is to dispel false opinion and doubt by the use of both reasoning and authority.

The reasoning was given in discussing the verse ‘Not of themselves, nor from another . . .’ and so on.
Authority is adduced in verses like these: ‘Whatever is not what it pretends to be, that is unreal declared the illustrious one. All things are not what they pretend to be and are therefore unreal.’ [MMK XIII.1] ‘The great sage declared that an absolute beginning is incomprehensible; afflicted existence is without beginning and end: there is no first, no last.’ [MMK XI.1] ‘In the Katyayananavadā Sutra, the illustrious one, who comprehends existence and non-existence, repudiated the thoughts “what is, is imperishable”, “what is is perishable”, or “what is, is both imperishable and perishable”.’ [MMK XV.7]

And in the Aksayamati Sutra it is said: ‘Which are the sutras for mankind at large and which are for initiates? Those spoken for the sake of entering the path are said to be for mankind at large; those spoken for the sake of attaining the final goal are said to be for initiates. Whichever sutras are concerned primarily with liberation characterized by the absence of being in particular things, by the absence of external objects and bigotted views, of willed action, of birth, origination, existent things, inherent natures, by the absence of individual beings, of personal spirits, of the person and of the self - such sutras are for wise initiates. This, venerable Sariputra, is called cleaving to the sutras which are for initiates, not to those for mankind at large.’

And as the Samadhiraja Sutra has it: ‘The one who can single out those sutras which are for the initiates knows the truth of the absence of being as taught by the perfect one; where, however, person, individual, and soul are spoken of, he knows all such terms are for mankind at large.’ In this sense Nagarjuna undertook to demonstrate the falseness of the understanding of dependent origination as arising, perishing, and so on.

Someone may object: if the attributes “arising”, “perishing” and the others do not hold, and if Nagarjuna undertook this work with the purpose of demonstrating the falsity of all possible assertions (sarvadharmanam mṛṣṭva) — whatever is false being non-existent — it follows that there are no bad deeds and, in their absence, no miserable lives. Nor can there be good deeds, and, in their absence, no good lives. But if there is no possibility of differentiating a good life from a bad, there can be no birth-death cycle in the Buddhist sense. And then there would be no purpose at all in undertaking any deed whatsoever.’

The delusive everyday as the basis of freedom

In reply we urge the essential falsity of things in order to counteract the inveterate commitment of the ordinary man to the reality of his everyday world as ‘the’ reality. It is definitely not so for the realized wise ones who take nothing at all as either false (mṛṣṭa) or not false (anmṛṣṭa). Furthermore, how could there still be soterically relevant deeds or a birth-death cycle for one who has comprehended the falseness of all the putative elements of existence (dharmā)? Such a one does not seize on any putative element whatsoever either as existing or as not existing.

As the illustrious one says in the Ratnakuta Sutra: ‘If one searches for the mind, Kasyapa, one cannot perceive it; what one does not perceive that one cannot take as real; what one does not take as real, that is neither past, future nor present; what is neither past, future nor present, that is not self-existent; what is not self-existent does not arise; what does not arise does not perish’, and so on.

Now anyone who is in the grip of misbelief will never comprehend the essential falseness of all putative elements of existence: he persists incorrigibly in the belief that dependent things are self-existent. Being thus incorrigible and being committed to the belief that what is directly given in the form of the putative elements of existence is reality, he carries out actions and he cycles in the birth-death cycle; being rooted in misbelief he will not attain nirvāṇa.

How can there be an adequate basis for affliction and freedom therefrom if things are false by their very nature? Just as it is in the case of an apparitional young beauty for those ignorant of her illusory nature, or in the case of a vision evoked by the realized one for those of favourable character.

The sutra on the Discourse with Drdhadhyasaya says: ‘It is, o son of a noble family, as when one is present at a magical show: one’s mind fills with desire on seeing a woman created by the magician; but, embarrassed, one leaves, and, having left, one tries to convince oneself that this magical woman was ugly, perishable, void and without reality’, and so on.

And in the Vinaya (in 29 Vinaya pitaka, a major component of the tripitaka, the Buddhist canon. It is concerned With the discipline of the community of monks.) it is told: ‘An artisan created a doll in the form of a young woman. Though not in reality a young woman it was just like one in appearance. It became the object of true love and desire for a certain painter. Similarly even things which are wholly false can provide, for the unenlightened, an adequate basis for affliction and freedom therefrom.’
And in the Ratnakuta Sutra there is a story of the five hundred apostate monks who withdrew from the Buddha’s presence. They were taught by two apparitional monks created by the Buddha that their chosen realities — meditational trance, ultimate insight, freedom, and the intuitive vision of freedom — merely hint metaphorically at nirvāṇa but are devoid of self-existence and any inherent nature. The two apparitional monks taught them to reject even the idea of ultimate nirvāṇa; taught them that one should not brood on ideas about ideas, nor seek knowledge through mere ideas; for one who does becomes enslaved to his ideas. They taught the five hundred that they should attain that state where all knowing by means of ideas has come to an end; that there is nothing beyond the cessation of knowing by means of ideas for a monk to achieve.

The apostate monks then returned to the Buddha’s presence and the Bodhisattva Subhuti questioned them: ‘Wither did you go and whence are you coming?’ ‘The Buddha’s teaching knows no going thither nor coming hither, Subhuti.’ ‘Who is your teacher?’ ‘One who was neither born nor will vanish into nirvāṇa.’ ‘And what teaching have you heard?’ it was neither of bondage nor freedom.’ ‘Who gave you your discipline?’ Subhuti then asked. ‘One who has neither body nor mind.’ ‘What was the course of your discipline?’ it was neither in the sense of removing ignorance nor of acquiring knowledge.’ ‘Whose followers are you?’ ‘His, who did not rest in a personal nirvāṇa nor personal enlightenment.’ ‘Who are your fellow wayfarers?’ ‘Those who do not course about in all the three worlds.’ ‘How long must you wait for your final emancipation?’ ‘Until all creatures of the perfectly realized one are finally emancipated.’ ‘How do you achieve your goal?’ ‘By fully comprehending the “I” sense and the “mine” sense.’ ‘Have, for you, the basic afflictions vanished?’ ‘Because of the utter dissolution of all the putative elements of existence whatsoever.’ ‘Have you overpowered Mara, the tempter?’ ‘By not taking as real the temptation of the factors of personal existence.’ ‘How do you revere your teacher?’ ‘Not by overt deed, nor by words, nor by thought.’ ‘How do you solve the problem of giving?’ ‘By not taking anything and by not accepting anything.’ ‘Have you transcended the birth-death cycle?’ ‘By holding neither to the naturalist, nor the eternalist view.’ ‘How do you practice giving?’ ‘By being utterly free from all grasping.’ ‘What is the purpose of your faring?’ ‘The 49.15 purpose of all the creatures of the perfectly realized one.’

So it was that the two unreal apparitional monks which Buddha created provided the basis for the liberation of five hundred monks.

And the Vajramandadharani has it: ‘Just as smoke, Manjusri, dependent on a piece of wood, the friction of rubbing and the action of someone’s hand, begins to appear and then fire follows, the actual flame however not being based solely in the wood or the rubbing or in the action of the hand; precisely so, Manjusri, do the flames of desire, aversion and illusion arise for the person who is deluded by illusionary false beliefs; for these flames are based neither in himself, nor outside of himself, not between the two.

‘Again, Manjusri, for what reason is being deluded known as delusion (moha)? It is known as delusion because it is defined as being utterly deluded about all the putative elements of existence whatsoever.’

Then Manjusri explained to the Buddha that he believed the dreams and imaginings of hellish tortures were equally illusory. ‘And precisely in this sense, illustrious one, did the illustrious Buddhas proclaim their doctrine for beings deluded by the four misbeliefs. In this world there are no women, men, individuals, eternal souls or persons. All such putative realities are erroneous, unreal and confusing; they resemble a conjuring trick or a dream or an apparition or a reflection of the moon in water. Those who have listened to this teaching of the perfectly realized one look on all things as purged of desire and delusion, that is, as without self-existence and free of false appearance. Such meet their death with their spirits at home in the infinite; after death they will all enter the realm of perfect nirvāṇa.’

By all this we have established that everyday things, lacking in self-existence and distorted by self-imposed misbeliefs of the unenlightened, are the cause of the basic afflictions. This is the birth-death cycle. How things whose nature it is to be unreal can bring about a purging of the afflictions is explained in the Madhyamakavatara.

Someone may object: But if things arise neither of themselves nor from another nor from both nor without cause, how can the Buddha’s words be understood: ‘Personal dispositions are dependent on primal ignorance'? The answer is: That holds for the everyday personal world but not for the way things are in truth.

How is the nature of this everyday world defined? We hold that the everyday world is determined by
pure conditionedness, by being utterly conditioned (pratyayata matrena). It cannot be established by the four theories of causality because they entail the self-existence of particular things, which is unintelligible.

If one accepts everything as utterly conditioned, that is, the reciprocal dependence of cause and effect, then neither of these exists in its own right and the theory of self-existence fails. That is why it is said, ‘People argue that afflicted existence arises of itself or from another, or from both or without a cause; but you (fn 30 Buddha) proclaimed it born of dependence.’

And Nagarjuna will say, [MMK VIII.12] ‘An agent subject can be held to exist only on the presupposition of a product, and a product can be held to exist only on the presupposition of an agent subject. We discern no other basis for establishing their existence.’ Buddha himself has said precisely the same thing, ‘The theory of the elements of existence implies: “if this is, that will arise; because this has arisen, that will arise”. Personal dispositions are dependent on primal ignorance, personal consciousness is dependent on personal dispositions and so on.’

The wise are not dependent on the means of cognition

There are those who will protest: You say that things do not arise from causes. Is this cognitive assertion (niscaya) based on some means of knowledge or is it not? If you consider that it is based on knowledge (pramanajya) you must speak to these points: How many means of knowledge are there? What are their characteristics? What are their distinctive objects? Do they arise spontaneously or from another, from both or without cause? If your cognitive assertion is not based on some means of knowledge this is unintelligible, because knowing something depends on a means of knowledge. Something that is unknown cannot become known except by some means of knowledge. In the absence of any means of knowledge nothing can be known. How then is your own cognitive assertion possible? It can make no sense to claim ‘things do not arise from causes’. With the same right with which there is the assertion that things do not truly arise I will maintain that all things do come into existence. Should you, however, not hold the view that all things do not truly arise, then, as there is no conviction on your own part, your opponent cannot possibly be persuaded and the composition of this treatise will have been entirely futile. That all things do exist will not be refuted.

In reply we say that if we Madhyamikas made any cognitive assertion at all it would either be based on a means of knowledge or it would not be. But we make no such assertions. How is that to be understood? In your thinking, where there is a negative assertion (aniscaya) there would have to be a counter assertion which, with reference to the first, would be positive. But as we make no negative assertion whatsoever how could there be a positive thesis which would either contradict or not contradict it? Because the opposing terms would be meaningless, as are the length and shortness of a donkey’s horns. So long as, thus, no cognitive assertion is made, what would the means of knowledge, which we speculated about so much, serve to establish? How can they have a correct number, definition and object? How can they arise spontaneously, from another, from both self and other, or at random? It is not for us to answer such questions.

If a Madhyamika does not, in any sense at all, advance cognitive claims, how is your assertion ‘things do not arise spontaneously or because of another, or because of both or from no cause at all’ to be understood? It has the form of a cognitive claim.

Our reply is that this pronouncement is an assertion for the ordinary man because it is argued solely on a basis which he accepts. But it is not a cognitive assertion for those wise in the Buddhist way.

Is there then no reasoned argument (upapatti) for the wise?

How could we say whether there is or there is not? The higher truth, for the wise, is a matter of silence (tusnimbhava). How then would everyday language, reasoned or unreasoned, be possible in that realm?

But if the wise ones do not give a reasoned account how will they convey the idea of a higher truth to the ordinary man? The wise do not give a reasoned account of the everyday experience of the ordinary man. Rather, adopting for the sake of enlightening others, and as a means only, what passes for reasoning in the everyday world, they work for the enlightenment of the ordinary man. It is precisely as with impassioned men who, in the grip of misbelief erroneously impute an unreal quality of goodness to the body because they do not perceive that it is in fact impure, and who so suffer torments. In order to dispel their passions, a god, or someone created by a Buddha would disclose the imperfections of the body previously concealed by the idea that it was good saying ‘There are hairs on this body and other
imperfections.’ And they will become free from this erroneously imputed idea of goodness and achieve freedom from the passions.

And so it is in this case. The wise ones do not, in any way, take particular things as having essential natures. But ordinary men, whose thought, because of weak vision, has succumbed to the defect of ignorance, impute an erroneous self-existence to any and all particular things and suffer excessively. The wise ones then discourse with them using only such arguments as ordinary men accept. For example, if someone (fn 31 The Samkhya school) argues: ‘A pot that exists does not arise from clay and the other factors’ this is accepted as a basis for argument. Then it can be concluded: ‘If a pot exists before it originates, it cannot originate because it is already in existence.’ Or if someone (fn 32 The Vaisesika school) argues: ‘A sprout cannot be produced from what is totally other, for example, from glowing coals’ this is accepted as a basis for argument. But then it can be concluded: ‘Neither can it arise from seeds, earth and so on which are usually given as its causes.’ (fn 33 Because these two are other.)

Should someone (fn 34 Possibly the Buddhist epistemologist Dignaga) now say: ‘But such origination is immediately given to us in experience’, this would not make sense either. The reason is that what is immediately given in experience (anubhava) is false, just because it is immediately given in experience (anubhavatvat). It is like the givenness of two moons for one with an optical defect. Consequently it does not make sense to set aside our objection, because ‘what is immediately given in experience’ must first be justified. (fn 35 i.e. presumes what must first be proved; a petitio principii.)

Conclusion

And so the endeavour of this first chapter (fn 36 The first chapter of the Prasannapada probably ended at this point originally, though in its present form it includes Chapters II and III of this translation. Cf. Preface, pp. xiii-xiv.) is to establish that things do not really arise by opposing the perverse foisting (adhyaroopa) of an essential nature on things. It will be the endeavour of the remaining chapters to invalidate and reject any and all reifying distinctions (vīseṣa) which are foisted on things. All reifying distinctions such as, ‘the one in motion’, ‘space to be traversed’ and ‘movement’ do not obtain and it is the purpose of the doctrine of ‘dependent origination’, i.e. the true way of things, to establish this.

Attack on the Possibility of Knowledge: Controversy with a Buddhist Epistemologist [Chapter II]

Should someone (fn 1 Probably a representative of the school of the Buddhist epistemologist Dignaga (480-540 AD), though the counter-arguments cited could also be those of Bhavaviveka.) say ‘It is the ordinary man’s experience of cognition and its objects which is described in our treatise’, we would counter ‘But what is the purpose and worth of this description?’ If it is rejoined ‘Incompetent logicians’ (fn 2 Non-Buddhist logicians of the Nyaya school) have ruined the subject by setting up faulty definitions; we have given the correct definitions’ this makes no sense either. If incompetent logicians have developed an erroneous description of cognition, clearly this would contradict the experience of the ordinary man and there would be no good purpose in undertaking to correct it. But this is not the case and your undertaking is quite pointless.

Furthermore, Nagarjuna, in the Vigrahavyavartani pointed out the following logical difficulty, among others, ‘If the attainment of knowledge rests on the valid means of knowledge, by what are these guaranteed?’ As you do not refute this objection your ‘correct’ definitions have no true explanatory power.

In any case, if you assert that there are but two valid means of knowledge (pramana) (fn 3 These are in the Dignaga school: (a) pratyaksa: intuitive, unmediated knowledge; (b) anumana: knowledge mediated through concepts, i.e. inference. The first gives access to ultimate reality, paramatha sat; the second to the everyday reality, samvrtisat: Madhyamika must fight this view because it makes enlightenment ontological, not the realization of a way.), conforming to a self-characterizing particular (svalaksana) and a universal (samanyalaksana) respectively, what is the subject which these two characterize? Or does it not exist? If it does, then it is an object of knowledge different from them. What becomes then of the mere duality of the means of knowledge? Again, such a subject might not exist. In that case even the characteristics, lacking a subject to characterize, would not exist. What then of the mere duality of the means of knowledge?

The self-characterizing particular

As Nagarjuna will say: ‘A subject of characterization is unintelligible without actual characteristics. If the subject of characterization is not established, characteristics become impossible as well.’[MMK V.4]

It may be rejoined: ‘But the characteristic does not characterize something other than itself; rather, if we take the suffix “istic” as the subject of “character”
according to the common grammatical rule, then the characteristic characterizes itself.’ (fn 4 This makes readier sense in Sanskrit than in English.)

Even so it is logically impossible for something to be characterized by itself, because of the difference in meaning between what characterizes and what is characterized, as between means and end. And this is precisely the flaw.

It may be rejoined: ‘There is no logical flaw here, because knowledge is itself instrumental and the self-characterizing particular is an integral part of this.’ We reply. It is commonly accepted that a self-characterizing particular is the exclusive (atmiyam), unique nature of a thing (svarupam), which it does not have in common with anything else. For example, of earth it is impenetrability, of feeling the immediate experience of an object, of consciousness (vijnana) it is the reflected awareness of objects. It is agreed that by such characteristics these things are characterized. But you, having cast aside the usually accepted meaning of the term, suppose that the subject is itself the means of characterization. Further, if you argue that perceptual consciousness (vijnana) is instrumental, this is saying that the self-characterizing particular is alone object (fn 5 i.e. subject of characterization) whilst the instrumentality of consciousness is another such self-characterizing particular. In this case, if the unique nature of consciousness is to be instrumental there will have to be an object (karma) different from consciousness. And precisely this is the flaw.

The logician may rejoin: ‘The impenetrability of earth and the other characteristics — i.e. what consciousness cognizes — are precisely the objects of consciousness and they are not different from the self-characterizing particular.’

This implies that as the self-characterizing particular, consciousness, is not an object, there is no object to be cognized. But a self-characterizing particular can be known only as object. The following distinction should therefore be made concerning the double nature of the object of knowledge — the self-characterizing particular and the universal: there is a self-characterizing particular which is an object of knowledge and that is what we call the thing characterized; there is something which is not an object of knowledge (consciousness) and it is said to be characterized by something else. If then this latter is, in turn, to be an object, it will have to be by some means other than itself (fn 6 i.e. by a subsequent act of consciousness.). So, vainly theorizing that a further act of knowledge will be this means, you incur the fault of an argument lacking a ground (fn 7 An argument of infinite regress.).

Unmediated self-awareness

Furthermore, you hold the theory of unmediated self-awareness (svasarhviiti), that is, that objectivity is assured of being integral to the object cognized because cognition is by means of unmediated self-awareness.

The refutation of unmediated self-awareness is given in detail in the Madhyamakavatara. It does not make sense that one self-characterizing particular should be characterized by another (fn 8 Consciousness as means) and that in turn be known through unmediated self-awareness. What is more, this last act of consciousness can in no way exist; it cannot be real except as a self-characterizing particular, there being no subject to be characterized; and because characteristics without a subject are unreal. What now of unmediated self-awareness?

To quote from the Questions of Ratnacuda: ‘The Bodhisattva contemplates the mind and enquires into the stream of consciousness asking “whence does consciousness arise”. And he thinks: “consciousness arises given an object”. Does that mean that the object is one thing and consciousness another? Or are they identical? If the object is one thing and consciousness another there will be a duplication of consciousness. If they are identical how can one perceive consciousness by means of consciousness? But consciousness does not perceive consciousness. The edge of a sword cannot cut its own edge nor can the tip of a finger touch that very tip. In the same way one act of consciousness cannot directly perceive the same act of consciousness. So it is that for such a one, concerned with what arises in the mind, the mind is impossible to ground, is without beginning or end, is not unchanging, is not uncaused nor unconditioned, is neither identical with itself nor different. He knows and sees the stream of consciousness like a twining creeper, he knows and sees the essential nature of consciousness, the groundlessness of consciousness, the hiddenness of consciousness, the imperceptibleness of consciousness, the absolute uniqueness of consciousness. As he knows and sees it thus, so he knows and sees it as it really is and he does not suppress it. This is the analysis of consciousness as he truly knows it and sees it. This, noble son, is the Bodhisattva’s contemplation of consciousness, this is his penetration into thought.’

There is thus no unmediated self-awareness (fn 9 If there were, Madhyamika would have to give up its view that
nowhere is an absolute fact vouchsafed us. ). As there is not, what will be characterized by what?

Character and characteristic

Further, something which is a characteristic (laksanam) must be either different from what it characterizes (laksyam), or not different. In the first case, as the characteristic is distinct from what is characterized it does not characterize it and is not a characteristic. And as the subject, what is to be characterized, is distinct from the characteristic it will not be characterized and will not be its subject. That is, because the characteristic is distinct from the subject, the subject would be without relation to its characteristics and so, lacking any relation to the characteristics, like a lotus in the sky - would not be their subject.

In the second case the subject and its characteristics are not distinct. Not being separate from its characteristics, as these have become one with it, the subject loses its character of being a subject. The characteristics, not being separate from the subject, as this has become one with them, are not truly characteristics.

It has been put this way: if the characteristic is other than the subject, then the subject is without characteristic; but if there is no difference between the two you have obviously declared that neither is real.’ (fn 10 One of Nagarjuna’s religious verses, Lokatita Stava 11.) And there is no other way of establishing the reality of subject and characteristic except through their essential difference.

Nagarjuna will put it this way: ‘How can a pair of things exist at all if they cannot be proved to exist either as identical or as different?’ [MMK II.21]

If, further, one suggests that their reality is inexpressible (avacyata) it cannot be so. What is called the inexpressible exists only where there is no clear knowledge of the difference between reciprocally dependent concepts. Where there is no clear knowledge of the difference it is not possible to define the difference as ‘such is a subject’, and ‘such is a characteristic’, and so it is impossible for either of them to exist separately (fn 11 One of the deepest of all Madhyamika presuppositions.). Therefore the reality of subject and characteristic cannot be established as inexpressible either.

The agent of perception

There is another question. If an act of perception (jnanam) is a means, and the object (visaya) is separate from it, who is the agent? A means and an object are not possible apart from an agent as in the case of an axe used for cutting. If it is supposed that agency resides in consciousness itself (citta), that too fails to make sense. Because the intuition of the bare object is due to consciousness whereas the perception of an object with qualities is due to the contents of consciousness (caitasa). It is generally accepted that ‘the intuition of the object is consciousness; the object’s qualities, however, are mental content.’

Where there is one principal function at work then means, agent, and action, each in its own right, are taken as component members according to the actual nature of the function. But in this case there is not one principal function for both pure intuition and perception. Rather, the principal function of pure intuition is singling out the bare object whereas in perception the object is determined by its qualities. Perception cannot be the means nor can consciousness be the agent. This is precisely the logical flaw.

You might argue that, according to scripture, all putative elements of existence are without inherent natures because in no sense is there an agent in them; and yet, though lacking an agent, the transactions of the everyday are quite real. But neither is this so; it does not penetrate the true meaning of the scriptures. This has been explained in the Madhyamakavatara.

Everyday predication

Again, you might argue that a self-characterizing particular is analogous to ‘the body of the statue’ or ‘the head of Rahu’ (fn 12 A legendary Indian demon who consists only of a head), where, though there is no attribute that is not of ‘body’ or of ‘head’ there is none the less subject and attribute. Even as one says ‘the self-characterizing nature of earth’ though earth is impossible apart from that nature. (fn 13 i.e. the difficulty with the expression ‘self-characterizing’ is merely an awkward verbal habit.)

It is not so because the cases are not analogous. A thoughtful man, because of the factual relationship of the words ‘body’ or ‘head’ to other existing things, like the words ‘mind’ or ‘hands’ will, having in mind their connection, enquire into the object of the words ‘body’ and ‘head’ and will ask ‘whose body?’ ‘whose head?’ Another man, not concerned with their relationship to other things, using merely verbal qualifications of the
statue and Rahu following common practice, will ignore the concern of the first. This much is understandable. But, as earth and the other elements cannot exist apart from ‘impenetrability’ and so on, the relationship of a subject and its characteristics does not make sense. If you think that it is not reprehensible to employ qualifying terms as the non-Buddhists do on the assumption of a separate subject, this would not be right. One should not accept for oneself concepts which the non-Buddhists have imagined and which are devoid of sense, because then one is committed as well to accepting their view of the valid means of knowledge and other such ideas.

Perhaps it is like pragmatically useful and tenable ideas (prajñaptīvānt) such as the individual person (pudgala)? This analogy is not apposite. It is true that, as part of ordinary discourse, one makes the uncritical attribution, namely that the statue is the possessor of its own possessed body or that Rahu is the possessor of a possessed head. If you say this comparison does hold because no other thing exists apart from the head and the body, none being directly perceived, it is not so. In ordinary discourse, everyday terms, which on being critically examined cease to be effective, function uncritically. A personal self (atman), for example, cannot, critically speaking, possibly exist separate from a body and the other factors of personal existence, even though in the world of the ordinary man it exists unrelated to such factors. But this case is not apposite to Rahu and the statue.

**Definition of the everyday**

Thus, if, after critical analysis, there is no subject separate from impenetrability and the other characteristics of earth and from the characteristics of the other elements as well, and equally no characteristic without a basis and separate from a subject, this is then precisely what we call the ‘false everyday world’ (samvṛti). By virtue of the reciprocal dependence (parasparapeksa) of these two concepts (in 14 Subject and attribute. This is the topic of Chapter VII.) Nagarjuna has rigorously established the nature of the false everyday world. And it is essential to understand it in this way; because otherwise the false everyday world could not be distinguished from what makes sense (upāpatti); and it itself would be the way things really are (tattvam) and not the false everyday world. It is not only the bodies of statues and such things which, on being critically examined are not in reason possible; rather, it will be argued later on, body, feelings and the other factors of personal existence are not, in reason, possible either. Then is it to be accepted that they, like the body of a statue and so on, are non-existent in the false everyday world? Not at all; that would be wholly false.

You may interject: Are we not just splitting hairs? We are certainly not declaring the entirety of transactional experience based on knowing and objects of knowledge to be true; it is rather that our argument establishes what the ordinary man accepts as true.

We reply that we too would say: Why this hairsplitting? The investigation concerns the experience of the ordinary man. Let it be; it is the false everyday world; it exists only in virtue of an unfounded belief in the reality of a personal self, which is a pure misbelief. It is the condition for the maturation of favourable qualities leading to liberation in those pursuing it, so long as there is no realization of the true nature of things (tattvam). But you destroy this false everyday world by your wrong-headed understanding of the distinction between it and the higher truth (paramartha-satya); you introduce inappropriate arguments.

I, being able to determine the true nature of the false everyday world, base myself on the viewpoint of the ordinary man. I refute one argument designed to invalidate the everyday world by matching it with another argument; like an old authority I refute you specifically when you go astray, using what is accepted by ordinary people. But I do not reject the everyday world. And so, if we take the experience of ordinary people, there will have to be something possessing characteristics as their subject, as well as the characteristics themselves. This is precisely the flaw in your argument. However, as in the higher truth there is no subject to be characterized, your dual definition falls away. How then can there be a duality of the means of knowledge? (in 15 The controversy is too involved for footnote commentary; but it is clear that Candrakīrti must contest any theory of the everyday which claims to be true, because that would preclude his own understanding of the world as a rationally impenetrable magical play.)

Furthermore you do not accept the traditional explanation of sentences as containing a connection between an action and its circumstances. That is indeed unfortunate. You yourself use sentences which express a real connection between action and circumstances, but you do not think that the meaning of a sentence consists of action, means, and so on. It is too bad that all this is based on nothing but your idiosyncratic views.
So long as, in this way, the dual nature of what is known the universal and the particular — is not objectively established, there will be other means of knowledge such as knowledge from authority.

The unintelligibility of perception

And now a different matter. Your theory (fn 16 Of the self-characterizing particular, the ultimate simple, as the object of perception.) does not make sense because your definition is too narrow. It does not comprehend such expressions of ordinary speech as ‘there is a perception of a jar’, and the speech of the unenlightened must be accepted as a base.

You may reply that blue and such qualities are perceptions which are the basis of the jar, because they are what perception, the means of knowledge, singles out. So, just as it is commonly said ‘the birth of a Buddha is a happy event’ where the cause is spoken of as the effect, similarly, though the jar is caused by the perception blue and such qualities, it is commonly said there is a perception of a jar where the effect is spoken of as the cause.

To speak thus of objects like jars does not make sense. Everyone experiences birth to be different from happiness. It is precisely unhappiness, the nature of temporal things being what it is, and the sources of trouble being many and various. To maintain ‘birth is happy’ is indeed illogical, but, in this case, it makes sense as a figure of speech. But when one says ‘there is a perception of a jar’ there is no unperceived jar, experienced in some private way, of which one could say, in a figure of speech, that it was perceived.

If you say that, because there is no jar apart from colour and the other qualities, its being perceived is a figure of speech, such a figure of speech makes even less sense. There is no basis for it: one cannot speak ‘metaphorically’ of the sharpness of a donkey’s horns.

Further, if it is agreed that the jar which is imbedded in everyday verbal transactions does not exist apart from colour and so on, its perception must be taken to be ‘metaphorical’ (upacarika). And if this is so, then colour and the other qualities do not exist apart from earth and the other elements and their perception must be taken to be metaphorical as well. To quote, ‘Even as ajar does not exist apart from form and so on, so form does not exist apart from wind and the other elements.’ (Catuhsataka, XIV, 14.)

And so your definition is inadequate because you fail to grasp the nature of these everyday verbal transactions. From the point of view of the true nature of things (tattvavid) one cannot concede the perception of blue and such qualities or of jars and such things. In terms of the false everyday world, however, we have to accept the perception of jars and such things.

To quote from the Catuhsataka, ‘Who, knowing the true nature of things, could say “the jar is perceived” or “an unperceived jar is created from all perceived qualities”? By the same reasoning all such qualities as the fragrant, the sweet and the soft must be repudiated by the sovereign mind.’ (XIII, 1, 2)

Or, further, the term perception means what is not mediated (aparoksa); what is immediately present is a perception. Jars and colours and so on are accepted as unmediated perceptions because it is agreed that they are immediately present to the senses in particular instances. The act of knowledge distinct from the object is considered to be perception as well, being the cause of what is perceived even as we say ‘a straw fire’ or ‘a chaff fire’ (fn 17 i.e. the straw or chaff is the cause of the fire but is the term which designates the effect.).

There is one (fn 18 Prasastapada of the Vaisesika School) who explains the term perception as meaning ‘what is real for its corresponding sense’. This derivation is not intelligible because the senses are not the objects of perception, but sense objects are. ‘Sense perception’ would have to become ‘object perception’ or ‘thing perception’.

Again it might be said (fn 19 A Buddhist view. Cf. Abhidharmakosa, I, 45) that the functioning of the act of perception depends on both factors. Perceptions are named, however, solely with reference to the sense organ because the degree of their acuteness conforms to changes in the sense organ. For example, we say ‘visual perception’. Thus, although perception functions with reference to a specific object, none the less it is based on a specific sense organ. Because it is named with reference to this base it becomes ‘sense perception’. Names customarily designate the specific base of anything: we say ‘the sound of a drum’ or ‘a sprout of barley’.

These examples do not hold for the argument given. Because, according to it, if the type of perception were designated according to its object, we would say ‘colour perception’, and so on. The differences between the six kinds of perception (or types of consciousness), however, could not be made clear in this way because the sixth sense, inner perception, functions with
precisely the same objects as does vision and the other five kinds of perception. That is, if there are six kinds of perception - that of colour and the others - and perceptions arise in strict dependence on the sense faculties, how can a perception, arising from one of the external senses be a mental or inner perception? If, however, the designation is according to the sense faculty, then the objects of vision and the other sense faculties can be the objects of mental or inner perception as well and the mutual differences would be clear.

In your (the Buddhist logician) argument, however, which is concerned with a definition of the valid means of knowledge, you presume that perception is merely that from which the elaboration of thought is removed (kalpanapodha) because you conceive of it in distinction from thought construction. You see no purpose in designating it by its special causes. As the actual number of the means of knowledge depends on the number of the kinds of objects of knowledge, and as the essential nature of the two means of knowledge has been determined exclusively by their conformity to the nature and reality of the objects of knowledge, nothing is served by designating them according to the faculty involved; the designation solely in terms of the object is, in every respect, the cogent one.

You may say that the designation rests solely on the faculty because in the everyday world the term sense-perception is accepted and object-perception is not, even if we mean object-perception. It is true that the term sense-perception is commonly accepted but we alone use it as the ordinary man understands it. By distorting everyday things as they actually are, the explanation you offer accepts a distortion of what is ‘commonly accepted’; that is, there is no commonly accepted sense-perception in your sense. A single visual perception based momentarily on a single sense faculty would not be perception: it would lack an adequately wide sense; and what is not perception in a single instance cannot be in many instances.

Your supposition is that perception is only that act of knowledge which is free of the elaboration of thought but this does not appear in the experience of the ordinary man at all although your concern is to give an account of knowledge and its objects in the experience of the ordinary man. This theory of perception as a means of knowledge turns out to be wholly futile.

You may quote the traditional text: ‘A man had a visual perception, blue, though he does not know “it is blue”.’ But this scriptural pronouncement is not relevant to a definition of sense perception; it is explaining that the five kinds of sense-perception are inert. Nor do the traditional texts say that sense-perception is limited to perception which is free of the elaboration of thought; that would not make sense.

The Madhyamika conclusion

It follows that in the everyday world (loka), everything, whether the subject of characterization (laksya), the self-characterizing particular or a general characteristic is unmediated because directly perceived. Sense perception is therefore defined as an object together with the act of knowledge. For cognition which is free of defect there is no perception of two moons; but for defective cognition the two moons are precisely ‘sense-perception’.

An act of knowledge whose object is not directly given is an inference. It derives from a distinguishing characteristic which is unfailingly concomitant with what is to be inferred. The pronouncements of those especially gifted in the direct perception of matters beyond the senses constitute authority. Knowledge of something never experienced, like a gayal, because it resembles what we have experienced, a buffalo, is called knowledge by analogy. ‘And so the attainment of knowledge by the ordinary man is defined in terms of the four means of knowledge.’(fn 20 Candrakīrti thus accepts four means of knowing, as Indian realists of the Nyaya school do.)

Both means and object of knowledge however are established in reciprocal dependence: in so far as there are means of knowledge there are objects of knowledge; in so far as there are objects of knowledge there are means of knowledge. But most emphatically neither the means of knowledge nor their objects can be established as existing in themselves. The everyday world should be accepted exactly as it appears to be. (fn 21 Again Madhyamika repudiates any theory which would offer another reality in place of the everyday.)

Enough of these logical arguments. We will now give an account of the main subject-matter. The teaching of the truth by the illustrious Buddhas was based on the way the ordinary man regards things.
Introduction to the Commentary

Nāgārjuna, who lived in South India in approximately the second century C.E., is undoubtedly the most important, influential, and widely studied Mahayana Buddhist philosopher. He is the founder of the Madhyamika, or Middle Path schools of Mahayana Buddhism. His considerable corpus includes texts addressed to lay audiences, letters of advice to kings, and the set of penetrating metaphysical and epistemological treatises that represent the foundation of the highly skeptical and dialectical analytic philosophical school known as Madhyamika. Most important of these is his largest and best known text, Mula-madhyamaka-kārikā (literally Fundamental Verses on the Middle Way). This text in turn inspires a huge commentarial literature in Sanskrit, Tibetan, Chinese, Korean and Japanese. Divergences on interpretation of Mula-madhyamaka-kārikā often determine the splits between major philosophical schools. So, for instance, the distinction between two of the three major Mahayana philosophical schools, Svatantrika-Mādhyamika and Prasangika-Mādhyamika reflect, inter alia, distinct readings of this text, itself taken as fundamental by scholars within each of these schools. (fn 1. See, for instance, Nagao(1989 and 1991), Lopez (1987), and Cabezón (1992) for more detailed discussion of Yogācāra and Śvātantra readings.)

The treatise itself is composed in very terse, often cryptic verses, with much of the explicit argument suppressed, generating significant interpretive challenges. But the uniformity of the philosophical methodology and the clarity of the central philosophical vision expressed in the text together provide a considerable fulcrum for exegesis. Moreover, the rich commentarial literature generates a number of distinct and illuminating readings. The central topic of the text is emptiness—the Buddhist technical term for the lack of independent existence, inherent existence, or essence in things. Nāgārjuna relentlessly analyzes phenomena or processes that appear to exist independently and argues that they cannot so exist, and yet, though lacking the inherent existence imputed to them either by naive common sense or by sophisticated realistic philosophical theory, (fn 2. It cannot be overemphasized that as far as Nāgārjuna—or any Mahayana Buddhist philosopher, for that matter—is concerned, the view that the things we perceive and of which we conceive, to the extent that they exist at all, do so inherently originates as an innate misapprehension and is not the product of sophisticated philosophical theory. That is, we naively and pretheoretically take things as substantial. This, as Nāgārjuna will argue, and as the Buddha himself argued, is the root delusion that lies at the basis of all human suffering. We can, to be sure, make sophisticated philosophy out of this. And much of Western and Asian metaphysics is devoted to that enterprise. But it is important to see that an intellectual rejection of that sophisticated essentialist metaphysics would not, from the standpoint of Buddhism, suffice for liberation from suffering. For the innate misapprehension the root delusion enshrined in common sense and in much of our language—would remain. Nāgārjuna’s text is aimed primarily against philosophy. But its soteriological goal is the extirpation of the very root of suffering.) these phenomena are not nonexistent—they are, he argues, conventionally real.

This dual thesis of the conventional reality of phenomena together with their lack of inherent existence depends upon the complex doctrine of the two truths or two realities—a conventional or nominal truth and an ultimate truth—and upon a subtle and surprising doctrine regarding their relation. It is, in fact, this sophisticated development of the doctrine of the two truths as a vehicle for understanding Buddhist metaphysics and epistemology that is Nāgārjuna’s greatest philosophical contribution. If the analysis in terms of emptiness is the substantive heart of Mula-madhyamaka-kārikā, the method of reductio ad absurdum is the methodological core. Nāgārjuna, like Western skeptics, systematically eschews the defense of positive metaphysical doctrines regarding the nature of things, arguing rather that any such positive thesis is incoherent and that, in the end, our conventions and our conceptual framework can never be justified by demonstrating their correspondence to an independent reality. Rather, he suggests, what counts as real depends precisely on our conventions. (fn 3. Though in the end, as we shall see, ultimate reality depends on our conventions in a way, it depends on our conventions in a very different way from that in which conventional reality does. Despite this difference in the structure of the relation between convention and reality in the two cases, however, it remains a distinctive feature of Nāgārjuna’s system that it is impossible to speak coherently of reality independent of conventions.)

For Nāgārjuna and his followers this point is connected deeply and directly with the emptiness of phenomena. That is, for instance, when a Mādhyamika philosopher says of a table that it is empty, that assertion by itself is incomplete. It deeply and directly with the emptiness of phenomena. That remains a distinctive feature of Nāgārjuna’s system that it is in the Western philosophical tradition. So there will no doubt be resonances of the original terms that are not captured by the translation and new resonances introduced that would be foreign to the original text. But this is unavoidable in a translation. Retaining the original term is worse, as it conveys nothing to the reader not already conversant with Tibetan, Sanskrit, and Buddhist philosophy. And using one of the ugly neologisms frequently introduced conveys the misleading impression that the original introduces such an ugly neologism. In the interest of not cluttering this text with philological footnotes, I will not generally defend my choices as I do here. But I do remind the reader of this and of any translation: Ca\ette\tor! A great deal of interpretation goes into any translation.) Now, to say that the table is empty is hence simply to say that it lacks essence and importantly not to say that it is completely nonexistent. (fn 5. See also Ng (1993), esp. pp. 12-15, for a good exposition. For an exposition of the contrary view, see Wood (1994).
will be clear, I disagree with his interpretation globally and on many points of detail.) To say that it lacks essence, the Mādhyamika philosopher will explain, is to say, as the Tibetans like to put it, that it does not exist “from its own side”-that its existence as the object that it is-as a table depends not on it, nor on any purely nonrelational characteristics, but depends on us as well. That is, if our culture had not evolved this manner of furniture, what appears to us to be an obviously unitary object might instead be correctly described as five objects: quite four useful sticks absurdly surmounted by a pointless slab of stick-wood waiting to be carved. Or we would have no reason to indicate this particular temporary arrangement of this matter as an object at all, as opposed to a brief intersection of the histories of some trees. It is also to say that the table depends for its existence on its parts, on its causes, on its material, and so forth. Apart from these, there is no table. The table, we might say, is a purely arbitrary slice of space-time chosen by us as the referent of a single name and not an entity demanding, on its own, recognition and a philosophical analysis to reveal its essence. That independent character is precisely what it lacks on this view. (fn 6. Note that nothing in this example hinges on the fact that the table is an artifact. The same points could be made about the tree from which its wood was hewn. The boundaries of the tree, both spatial and temporal (consider the junctures between root and soil, or leaf and air; between live and dead wood; between seed, shoot, and tree); its identity over time (each year it sheds its leaves and grows new ones; some limbs break; new limbs grow); its existence as a unitary object, as opposed to a collection of cells; etc., are all conventional. Removing its properties leaves no core bearer behind. Searching for the tree that is independent of and which is the bearer of its parts, we come up empty. I thank Graham Parkes for pointing out the need to stress this point.)

So from the standpoint of Mādhyamika philosophy, when we ask of a phenomenon, Does it exist?, we must always pay careful attention to the sense of the word “exist” that is at work. We might mean exist inherently, that is, in virtue of being a substance independent of its attributes, in virtue of having an existence, and so forth, or we might mean exist conventionally, that is to exist dependently, to be the conventional referent of a term, but not to have any independent existence. No phenomenon, Nāgārjuna will argue, exists in the first sense. But that does not entail that all phenomena are nonexistent tout court. Rather, to the degree that anything exists, it exists in the latter sense, that is, nominally, or conventionally. It will be important to keep this ambiguity in “exists” in mind throughout the text, particularly in order to see the subtle interplay between the two truths and the way in which the doctrine of the emptiness of emptiness resolves apparent paradoxes in the account.

And this analysis in terms of emptiness—an analysis refusing to characterize the nature of anything precisely because it denies that we can make sense of the idea of a thing’s nature-proceeding by the relentless refutation of any attempt to provide such a positive analysis, is applied by Nāgārjuna to all phenomena, including, most radically, emptiness itself. For if Nāgārjuna merely argued that all phenomena are empty, one might justly indict him for merely replacing one analysis of things with another, that is, with arguing that emptiness is the essence of all things. But Nāgārjuna, as we shall see, argues that emptiness itself is empty. It is not a self-existent void standing behind a veil of illusion comprising conventional reality, but merely a characteristic of conventional reality. And this, as we shall see, is what provides the key to understanding the deep unity between the two truths. (fn 7. Siderits (1989) puts this point nicely: “The ultimate truth is that there is no ultimate truth” (p. 6.)

While Nāgārjuna is a powerfully original thinker, he is clearly and self-consciously operating squarely within the framework of Buddhist philosophy. As such, Nāgārjuna accepts and takes it as incumbent upon him to provide an account of the Four Noble Truths, nirvāṇa, buddhahood, and other fundamental Buddhist soteriological conceptions. Moreover, he takes it as a fundamental philosophical task to provide an understanding of what Buddhist philosophy refers to as pratītya-samutpāda - dependent coorigination. This term denotes the nexus between phenomena in virtue of which events depend on other events, composites depend on their parts, and so forth. Exactly how this dependency is spelled out, and exactly what its status is, is a matter of considerable debate within Buddhist philosophy, just as the nature of causation and explanation is a matter of great dispute within Western philosophy. Nāgārjuna is very much concerned to stake out a radical and revealing position in this debate. We will, in fact, see that this position and its connection to his understanding of emptiness and the nirvāṇa-saṃsāra relation provides the key to understanding his entire text.

_Mula-mādhyamaka-kārikā_ is divided into twenty-seven chapters, which fall roughly, though by no means officially, into four sections. In the first section of the text, comprising Chapters I through VII, Nāgārjuna discusses the fundamental theoretical constructs in Buddhist ontology, such as dependent origination, change and impermanence, perception, the aggregates that compose the self, the elements’ that constitute the universe, and the relation between substance and attribute. In the second major section, Chapters VIII through XIII, Nāgārjuna focuses on the nature of the self and of subjective experience. Chapters XIV through XXI are primarily concerned with the external world and the relation of the self to objects. The final section, Chapters XXII through XXVII, addresses phenomena associated with the ultimate truth, such as buddhahood, emptiness, and nirvāṇa, and the relation of the conventional to the ultimate and of saṃsāra to nirvāṇa. The chapters that form the climax of the text are found in this section. But it is important to note that in fact the dialectical structure of the text requires a reading of these chapters in order to fully grasp the import of the earlier ones. This is because the doctrine of the emptiness of emptiness does not fully emerge until this point, and it is crucial to Nāgārjuna’s argument that
all phenomena are empty and that their emptiness is also empty. (fn 8. I should note that this division of the text is not in any sense canonical. Tsong Khapa sees the structure slightly differently; Kalupahana (1986) proposes yet another structure. I see my own division, like these others, simply as a useful heuristic device for parsing the argument. (It should be noted that the division of the text even into chapters is due to Candrakīrti.))

The order of the chapters is often, though not always, important. Often a chapter will consider a phenomenon held by a proponent of another philosophical school to be inherently existent. Or an opponent may charge Nāgārjuna with denying the actuality of a phenomenon in virtue of asserting its emptiness. In his analysis, Nāgārjuna will typically argue that the phenomenon proposed as inherently existent cannot be so and indeed is empty, or that the phenomenon whose existence he is charged with denying is, in fact, on his analysis, while nonexistent, from the ultimate point of view, conventionally existent. In each case, he will argue that the functions the opponent thought could only be served by an inherently existent phenomenon can, in fact, be served only by empty phenomena. But quite often these analyses will inspire natural rejoinders of the form, “Yes, x might well be empty and only conventionally existent, but we can’t make sense of its conventional existence without presupposing the inherent existence of y.” In such cases, the next chapter will typically address that natural rejoinder. So, for instance, the first chapter argues that conditions and the relation between phenomena and that on which they depend are empty. But a natural rejoinder is that even conventional but actual conditions can only be understood in the context of change or impermanence. So Chapter Ā addresses change. The text hence forms a single sustained argument with only a few digressions or changes of subject, generally marked by the section divisions I have suggested above.

The first chapter addresses dependent origination. While many Western commentators assert that this chapter opens the text simply because it addresses a “fundamental doctrine of Buddhism,” (fn 9. Kalupahana (1986), p. 32.) my analysis of the text suggests that Nāgārjuna begins with causation for deeper, more systematic reasons. In Chapters Ā through XXI, Nāgārjuna addresses a wide range of phenomena, including external perceptibles, psychological processes, relations, putative substances, and attributes, arguing that all are empty. In the final six chapters, Nāgārjuna generalizes the particular analyses into a broad theory concerning the nature of emptiness itself and the nature of the ultimate, of liberation, and of the relation between emptiness and dependent arising. At the close, he replies to objections. It is generally, and in my view correctly, acknowledged that Chapter XXIV, the examination of the Four Noble Truths, is the central chapter of the text and the climax of the argument, with Chapter XXV on nirvāṇa and samsāra sharing that spotlight. One verse of Chapter XXIV, verse 18, has received so much attention that interpretations of it alone represent the foundations of major Buddhist schools in East Asia:

18. Whatever is dependently co-arisen
That is explained to be emptiness.
That, being a dependent designation
Is itself the middle way.

Here Nāgārjuna asserts the fundamental identity of (1) emptiness, or the ultimate truth; (2) the dependently originated, that is, all phenomena; and (3) verbal convention. Moreover, he asserts that understanding this relation is itself the middle-way philosophical view he articulates in Mula-madhyamaka-kārikā. This verse and the discussion in the chapters that follow provide the fulcrum for Candrakīrti’s more explicit characterization of the emptiness of emptiness as an interpretation of Nāgārjuna’s philosophical system the interpretation that is definitive of the Prasangika-Madhyamika school. (fn 10. For a translation of much of Candrakīrti’s commentary (Prasannapadā), see Sprung (1979). Huntington and Wangchen (1993) provide an excellent translation of Candrakīrti’s principal treatise on Madhyamika (Mādhyamakāvatāra.) In what follows I will provide an interpretation of the text inspired by the centrality of this verse and of the chapters forming its context that harmonizes with Candrakīrti’s. In fact, on my reading of the text this doctrine is already found in the opening chapter-the examination of conditions. Reading the text in this way locates the doctrine of the emptiness of emptiness not only as a dramatic philosophical conclusion to be drawn at the end of twenty-four chapters of argument, but as the perspective implicit in the argument from the very beginning and only rendered explicit in XXIV. Reading the text in this way will show us exactly how XXIV:18 is to be understood and just why a proper understanding of causality is so central to Buddhist philosophy.

When a Westerner first encounters Mula-madhyamaka-kārikā or other Madhyamika texts, the philosophical approach can appear highly metaphysical and downright weird. The unfamiliar philosophical vocabulary, the highly negative dialectic, and the cryptic verse form are indeed forbidding. Most bizarre of all, however, at first glance is the doctrine that all phenomena, including self and its objects, are empty. For indeed Nāgārjuna and his followers do argue that the entire everyday world is, from the ultimate standpoint, nonexistent. And that does appear to stand just a bit deeper into philosophical left field than even Berkeley dares to play. But if the interpretation I will urge is adopted, the real central thrust of Madhyamika is the demystification of this apparently mystical conclusion. While it might appear that the Madhyamikas argue that nothing really exists except a formless void, in fact the actuality of the entire phenomenal world, persons and all, is recovered within that emptiness. (fn 11. For useful discussions of the recovery of the conventional within emptiness and the relation between the two truths in Madhyamika philosophy, see Sprung (1973, 1979), esp. 1973, pp. 15-20; Newland (1992); Napper (1992); Streng (1967), esp. chap. 3.)
Now a word about the methodology and intent of this commentary: Since the intended audience is Western philosophers and students of philosophy whose primary study has been in the Western tradition, I have tried throughout, insofar as that is possible without distortion of the meaning of the text, to explain Nāgārjuna’s arguments and positions in language familiar to Western philosophers. I have occasionally used analogies to positions and arguments found in Western texts, but have avoided doing so where I thought that the comparisons might force a Procrustean analysis of Nāgārjuna’s own views. And it is, of course, impossible and pointless to completely recast Nāgārjuna’s positions as those with which we in the West are familiar and to replace his technical terminology with ours. For Nāgārjuna is not a Western philosopher. He is an Indian Buddhist philosopher whose work we approach through a vast Asian Buddhist commentarial literature. And while many of his concerns, problems, theses, and arguments are recognizable cousins of ours, many are not, and there are genuine differences in outlook.

This is what makes Nāgārjuna’s work so exciting to read and to think about—it provides a genuinely distinctive perspective on a set of problems and projects that we share. In commenting on Nāgārjuna’s text, I am constantly aware of walking a philosophical and hermeneutical tightrope. On the one hand, one could provide a perfectly traditional commentary on the text—or better, a translation of one of the major Sanskrit or Tibetan commentaries—or a transcript of oral commentary by a recognized scholar of the tradition. Such a commentary would explain in great detail the way the text is seen from the perspective of its home tradition and the background of Buddhist controversies to which the text responds. A commentary like this would undoubtedly be of great use to Buddhologists and philosophers already steeped in Buddhist philosophy and its history. And indeed Sprung’s translation of most of Candrakīrti’s Prasannapadā (Lucid Exposition), including the root verses from Mula-madhyamaka-kārikā, partially fulfills this need. But many of these scholars and students already have access to the relevant texts in their original languages or to teachers situated within the Buddhist tradition.

On the other hand, one could try to comment on the text by presenting a theory of what Nāgārjuna would have said had he been a twentieth-century Western philosopher. One could then feel free to step back from the internecine debates in the classical Buddhist academy, which were so absorbing to the historical Nāgārjuna and so distant from our own context, and simply ask how his arguments would be formulated in the context of the contemporary philosophical scene. Leaving aside the question of how one would identify the possible philosopher denoted by this bizarre counterfactual, this would again be a profoundly unsatisfying enterprise. For what makes this a great text is not simply that we can extrapolate its significance to our own context, but that in reading it, to borrow Gadamer’s metaphor, we are able to fuse its textual horizon with our own. It is the bringing to the present of Nāgārjuna’s own concerns, insights, and arguments that is revelatory, not speculation about a related counterfactual nonentity. And for this fusion of interpretive horizons to be possible, we must, as much as possible, respect the original horizon of the text. Having said this, one must confess the double difficulty of giving sense to the phrase “Nāgārjuna’s own concerns, insights, and arguments.” The recovery of authorial intent as a hermeneutic task is problematic (especially when the author is so culturotemporally remote and when his corpus is as controversial in composition and interpretation as is Nāgārjuna’s). But it is equally problematic as a hermeneutic desideratum. For who is to say that Nāgārjuna was/is the best possible interpreter of Mula-madhyamaka-kārikā? After all, he did not have the benefit of the long commentarial tradition he spawned. (fn 12. The late Wilfrid Sellars was fond of saying that we understand Plato better than Plato could ever have understood himself: Plato, for instance, could never have dreamed of the consequences that would be drawn from his arguments.) A great text—or, as Gadamer has referred to such texts, an “eminent text”....-grows over time and merits reinterpretation and rereading as the tradition in which it participates develops and provides an ever-expanding context for its reading. Moreover, I am reading Nāgārjuna largely through the lens of the Tibetan commentarial tradition and through the Tibetan translation of his text—the text read and discussed by the scholars of this long, deep, and intellectually diverse and rich tradition, few of whom had access to Sanskrit. So the Nāgārjuna whose views I am exploring is an evolving figure, rooted in the life and writing of a first or second century Indian monk, of whom we know but little, but whose literary life and identity extends through a complex, sophisticated, and contested textual and philosophical tradition in India and Tibet and in the West.

As a consequence, in interpreting this text on the Middle Path for a Western audience, I have sought insofar as possible to find a middle path between these extremes. I have tried to explain Nāgārjuna’s own arguments and their context as straightforwardly as possible without burdening the Western philosophical reader with extended discussion of the specifically ancient Indian Buddhist philosophical debates. I have indicated ways in which very specific arguments can be generalized and have commented on general structural features of arguments, chapters, and the text. I have throughout explained arguments in Western philosophical terms, while situating those arguments in their Buddhist context. There may be times when my desire to make arguments accessible has led to some distortion in Nāgārjuna’s sense. There may also be times at which, by leaving arguments set firmly within the soteriological context of Buddhism, I have left those arguments looking like curios to my Western audience. Some of this may be
unavoidable, but in any case I have sought specifically to minimize these difficulties.

The interpretation I offer is situated squarely within a Prasangika Madhyamika interpretation of Nāgārjuna (the philosophical school that reads *Mula-madhyamaka-kārikā* through the commentaries of Buddhapalita and Candrakīrti). But more specifically, my reading is heavily influenced by the Tibetan Gelukpa tradition that takes as central the commentaries of dGe-'dun-grub, mKhas-grub-rje, and especially, Je Tsong Khapa. My interpretation of the text reflects not only Candrakīrti’s and Je Tsong Khapa’s commentaries, but also the extended oral commentary I have received on this text from the eminent Tibetan Madhyamika scholars, especially the Yen. Professor Geshe Yeshes Thap-Khas of the Central Institute of Higher Tibetan Studies and the Yen. Professor Gen Lobzang Gyatso of the Institute of Buddhist Dialectics (I should point out that both of these scholars-as well as others to whom I am indebted for valuable conversations, including the Most Yen. Prof. Samdhong Rinpoche and the Yen. Geshe Namgyal Wangchen - received their education at Drepung Loseling Monastic College, and so my interpretation also reflects more particularly the academic tradition of that institution).

Having characterized this as a tradition of interpretation, I must emphasize that it is not, as it is often represented, and as it often represents itself, a homogeneous tradition. Though there is a hermeneutic convention in Indo-Tibetan Buddhist literature of presenting oneself as merely expounding faithfully the views of all of the earlier commentators, this is almost never the truth. There are considerable divergences in interpretation and in philosophical position within Buddhist schools and within lineages. Indeed the Tibetan scholars I have regularly consulted, despite the fact that they shared many of the same teachers and an identical curriculum, differ widely among themselves on many issues. It would hence be impossible in any case to represent accurately the Prasangika-Madhyamika interpretation, or even the Gelukpa interpretation or the Drepung Loseling interpretation of *Mula-madhyamaka-kārikā*.

I emphasize that even if one could identify such a homogeneous interpretation, I am not here presenting the interpretation or interpretations of any of these commentators or scholars, individually or collectively. There are substantial debates within these traditions regarding interpretative issues, and I do not consistently side with any particular faction (though I do think that it is true that my reading never conflicts directly with that of Candrakīrti); sometimes (as in my reading of the final chapter) I depart from the most common Geluk-pa interpretation entirely in favor of a line more closely associated with the Nyingma-pa reading of the text. Nor is the purpose of this text to compare, criticize, and resolve differences between interpretations. Instead, I here present the text as I read it, having been influenced by all of these commentators and teachers, and as I present it to my Western colleagues. And my intention in doing so is to let the text stand alone as a work of philosophy valuable in its own right to anyone interested in fundamental metaphysical, epistemological, and soteriological questions, not as a text to be studied only as part of “the history of philosophy” or “comparative philosophy.”

Moreover, my exposition will be deliberately sympathetic. My goal is not to assess Nāgārjuna’s philosophy, but to present and elucidate it and to do so in a way that, while making the text accessible to Western philosophers, does not disguise the fact that the text made accessible is an early Indian Madhyamika philosophical treatise, read by a Western philosopher through an extended Indo-Tibetan commentarial and academic tradition. It is neither a contemporary treatise nor a second century text transported miraculously to us without the distortion of time and cultural distance. Buddhologists may lament the lack of critical discussion of Buddhist antecedents and commentarial sequellae, and my Tibetan colleagues may be uncomfortable with some of the tendentious extensions of arguments beyond the dialectical contexts in which they originally arose. Despite this, I hope that for Western philosophers interested in approaching Madhyamika in particular or Buddhist philosophy in general, and for students of Nāgārjuna’s philosophy in the West, this exposition will make his text more accessible.
Dedication
Dedication

BATCHELOR (POETIC “TRANSLATION”)

I bow to buddhas
Who teach contingency
(No death, no birth,
No nothing, no eternity,
No arrival, no departure,
No identity, no difference)
And ease fixations.

JONES (COMMENTARY)

The Dedication

Nagarjuna makes both an ontological claim and a methodological claim here. First, he describes the empty state of things. Some of the negations - the “unceasing, unborn, unannihilated” - may suggest a permanent transcendental reality such as Brahman, but the claim is only about the phenomenal world seen correctly. He makes clear in the text that only what is real - i.e., self-existent - is something that can be born or cease (but then he argues that the real cannot change), and what is void of self-existence cannot be born, cease, or be annihilated. Thus, phenomenal reality as it really is (tattva) is free of anything real (self-existent) and thus of anything that could arise and cease. Notice that it is not an affirmation of emptiness, as if that were itself a reality or the source of a reality.

Second, he brings up the “peaceful stilling of all conceptual creations (prapancha).” This indicates the centrality of prapancha.

GYAMTSO (COMMENTARY)

Opening Homage

I prostrate to the one
Who teaches that whatever is dependency arisen
Does not arise, does not cease,
Is not permanent, is not extinct,
Does not come, does not go,
And is neither one thing nor different things.
I prostrate to the perfect Buddha, the supreme of all who speak,
Who completely dissolves all fabrications and teaches peace.

THIS VERSE OF HOMAGE with which Nagarjuna begins the text explains why it is that we should have such great respect for the Buddha. Why is the Buddha worthy of our prostration? It is because the Buddha teaches that all of the phenomena of samsara and nirvana are dependently arisen mere appearances, and that therefore their true nature transcends the concepts of arising and ceasing, of permanence and extinction, of coming and going, and of being one thing or different things.

In fact, essential reality (dharmata) transcends all conceptual fabrications, and the Buddha taught this to his disciples very clearly. In this way the Buddha taught the path that dissolves all conceptual fabrications and thereby leads to the peace that is free from samsara’s suffering. Suffering comes from taking things to be real—from taking friends and enemies to be real, from taking birth and death to be real, from taking clean and dirty to be real, and from taking happiness and pain in general to be real. The Buddha taught that the true nature of reality actually transcends all these concepts—it is the equality of all these seeming opposites—and he also taught us how to realize this. Since putting the Buddha’s teachings into practice leads to the complete transcendence of suffering and the perfect awakening of the omniscient enlightened mind, then these teachings are the greatest words ever spoken, and the Buddha himself is the supreme of all who speak. For these reasons, the Buddha is worthy of our respect and our prostration.

KĀRIKĀ STUDY

Dedicatory Verse

INADA (Skt):
I pay homage to the Fully Awakened One, the supreme teacher who has taught the doctrine of relational origination, the blissful cessation of all phenomenal thought constructions. (Therein, every event is "marked" by): non-origination, non-extinction, non-destruction, non-permanence, non-identity, non-differentiation non-coming (into being), non-going (out of being).

JONES (Skt):
I bow to the fully-enlightened Buddha, the best of teachers, who taught that whatever arises dependently is unceasing, unborn, unannihilated, impermanent, not coming, and not going; and who also taught the peaceful stilling of all conceptual creations.

KALUPAHANA (Skt):
I salute him, the fully enlightened, the best of speakers, who preached the non-ceasing and the non-arising, the non-annihilation and the non-permanence, the non-identity and the non-difference, the non-appearance and the non-disappearance, the dependent arising, the appeasement of obsessions and the auspicious.

MCCAGNEY (Skt):
Dedication:
I greet the best of teachers, that Awakened One, who taught liberation, the quieting of phenomena, interdependent origination which is: nonceasing and nonarising, nonmomentary and nonpermanent, nonidentical and nondifferent, noncoming and nongoing.

SPRUNG (Skt):
Neither perishing nor arising in time, neither terminable nor eternal,
Neither self-identical nor variant in form, neither coming nor going;
Such is the true way of things, the serene coming to rest of the manifold of named things,
As taught by the perfectly enlightened one whom I honour as the best of all teachers.

STRENG (Skt):
Introductory Verses
I salute him, the fully-enlightened, the best of speakers, who preached the non-ceasing and the non-arising, the non-annihilation and the non-permanence, the non-identity and the non-difference, the non-appearance and the non-disappearance, the dependent arising, the appeasement of obsessions and the auspicious.

STCHERBATSKY (Skt):
DEDICATION
The Perfect Buddha,
The foremost of all Teachers I salute.
He has proclaimed
The Principle of (Universal) Relativity,
'Tis like blissful (Nirvana),
Quiescence of Plurality,
There nothing disappears.
Nor anything appears,
Nothing has an end.
Nor is there anything eternal,
Nothing is identical (with itself),
Nor is there anything differentiated,
Nothing moves.
Neither hither nor thither.

ROBINSON (Skt): I offer salutation to the best of preachers,
the Buddha, who has taught that dependent co-arising has
no ceasing, no arising, no nullification, no eternity, no
unity, no plurality, no arriving, and no departing, that it is
quiescent of all fictions, that it is blissful.

BOCKING (Ch):
1v1 No arising and no ceasing
No permanence and no severance
No identity and no difference
No arriving and no departing
1v2 To the one who can expound this matter of causality
And completely destroy all sophistries
I bow my head in reverence:
The Buddha, greatest of all teachers.

BATCHelor (Tb):
I prostrate to the youthful Manjushri.
I bow down to the most sublime of speakers, the
completely awakened one who taught contingency
(no cessation, no birth, no annihilation, no
permanence, no coming, no going, no difference, no
identity) to ease fixations.

DOCTOR (Tb):
Homage
That which originates dependently
Does not cease and does not arise,
Does not come and does not go,
Is not annihilated and is not permanent,
Is not different and not the same.
To the true teacher who reveals this peace,
The complete pacification of constructs,
To the perfect Buddha I bow down.

GARFIELD (Tb):
Dedictory Verses:
I prostrate to the Perfect Buddha,
The best of teachers, who taught that
Whatever is dependently arisen is
Unceasing, unborn,
Unannihilated, not permanent,
Not coming, not going,
Without distinction, without identity,
And free from conceptual construction.

GARFIELD-SAMTEN (Tb):
I prostrate to the perfect Buddha,
The best of all teachers, who taught that
That which is dependent origination is
Without cessation, without arising;
Without annihilation, without permanence;
Without coming; without going;
Without distinction, without identity
And peaceful—free from fabrication.

GOLDFIELD (Tb):
OPENING HOMAGE
I prostrate to the one
Who teaches that whatever is dependently arisen
Does not arise, does not cease,
Is not permanent, is not extinct,
Does not come, does not go,
And is neither one thing nor different things.
I prostrate to the perfect Buddha, the supreme of all who
speak,
Who completely dissolves all fabrications and teaches peace.

ROBINSON (Ch):
Not arise, also not cease, not permanent, also not cut-off, not
one, also not different, not come, also not go-out, able
speak this cause condition, well quench all-the play
discourse, I bow head revere Buddha, all-the speak
among number one.

ROBINSON (Ch - Remarks):
The Chinese does not make clear that the eight "norts" are all
attributes of dependent co-arising. The Sanskrit order has
been kept, but the syntactic relationship has not been
preserved. The Chinese translates the Sanskrit privative
bahuvrihis by straight negative plus verb. It renders
ekartham (having one object, unity) by i 一 (one), and
nanartham (having diverse objects) by i 異 (different).
In verse 2, yin-yuan 因緣 (cause and condition) is more
properly a translation of hetu-pratayya or of nidana than
of pratitya-samutpada, for which there is another and
unambiguous term yuan-ch'i 縁起 (condition arising).
Neng shuo 能說 (able speak, the speaker) translates yak
desayam asa (who has taught). "All-the speak among
number one" renders vadatam varam (best of
speakers/preachers). Chu shuo 諸說 (all-the speak) does
not indicate that vadatam is "of those who speak." The
word order "Buddha, all-the speak among number one" is
Sanskrit, as an attributive phrase regularly precedes its
head-word in Chinese. Chu hsi-lun 諸戲論 (all-the play
discourse) corresponds to prapanca-, but the chu is
interpretive. Prapanca- is the first member of the
compound prapanca-upasama and is not marked for
number. Shan 善 (well) in the second line perhaps
renders sivam (blessed), but certainly does not convey the
meaning of this highly important word.
1/1 – 1/2 With these two verses he reveres the Buddha, and expounds in brief the supreme meaning.

Question: Dharmas are innumerable. Why do the negations refer only to these eight things?

Answer: Although dharmas are innumerable, by-the brief exposition of eight things he effects a comprehensive negation of all dharmas.

(1c14) As to ‘no arising’, the commentators expound the characteristic of ‘arising’ in various ways. Some say that cause and effect are identical, some say that cause and effect are different, some say that the effect pre-exists in the cause, some say that the effect does not pre-exist in the cause, some say that things arise from themselves, and some say they arise from other things, while some say that they arise from both together. Some say that arising exists, while others say that arising is nonexistent. Such ways of expounding the characteristic of arising are entirely wrong, and these matters will be enlarged upon later. Since no fixed characteristic of arising is tenable, there is no arising. As for ‘no ceasing’; if there is no arising, how can there be ceasing? Since there is no arising and no ceasing, the remaining six are also negated.

(1c21) Question: If ‘no arising and no ceasing’ imply a comprehensive negation of all dharmas, why does he repeat the exposition with regard to the other six things?

Reply: It is in order to bring out the meaning of ‘no arising and no ceasing’. There are some people who do not accept no arising and no ceasing, but do believe in no permanence and no severance. A deep enquiry into no permanence and no severance shows them to be the same as no arising and no ceasing, and why? If a dharma really exists then clearly it cannot be nonexistent. If it formerly existed and now does not exist, this constitutes severance. If its nature existed before, then this would be permanence. This is why he teaches ‘no permanence and no severance’, to lead into the meaning of ‘no arising and no ceasing’.

(2a3) There are some people who, although they hear these four ways of negating dharmas, nevertheless establish dharmas through the other four ways, but these are also mistaken. If all dharmas were one there could be no causal relations, while if they were different there could be no continuity of characteristic. These things will be refuted in various ways later on. Therefore we declare again ‘no identity and no difference’. There are some people who, although recognizing these six ways of negating dharmas nevertheless establish dharmas in terms of arriving and departing. As for ‘arriving’, they say that dharmas come from the god ‘Self-Being’ (Isvara), from the world-nature or from the atoms, and so forth. As for ‘departing’, they say that dharmas return to their place of origin.

(2a8) Moreover, the myriad things do not arise, and why? It is because of direct worldly perception. As we see with our worldly eyes, corn does not arise at the beginning of a kalpa, and why? Without the corn at the beginning of the kalpa there could be no corn now. If there were corn existing now apart from that at the beginning of the kalpa, there would have been an arising, but in fact this is not so, and therefore there is no arising.

Question: If there is no arising, then surely there must be ceasing?

Reply: There is no ceasing, and the reason for this lies in direct worldly perception. As we see with our worldly eyes, the corn which was there at the beginning of the kalpa did not cease. If it had ceased there would be no corn now, but in fact there is corn, and therefore there is no ceasing.

Question: If there is no ceasing then surely there must be permanence?

Reply: There is no permanence, and the reason for this lies in direct worldly perception. As we see with our worldly eyes things are not permanent; for example, when the corn sprouts the seed decays, and therefore there is no permanence.

Question: If there is no permanence then surely there must be severance.

Reply: There is no severance, and the reason for this lies in direct worldly perception. As we see with our worldly eyes things are not cut off. For instance, the sprout grows out of the corn, and therefore there is no severance. If there were severance there would be no continuity of characteristics.

(2a20) Question: If this is so, then all things are one.

Reply: They are not one, and the reason for this lies in direct worldly perception. As we see with our worldly eyes, things are not one; for example, the corn does not constitute the sprout and the sprout does not constitute the corn. If the corn constituted the sprout and the sprout constituted the corn, they would be one, but in fact this is not so and therefore they are not one.

Question: If they are not one, then surely they must be different?

Reply: They are not different, and the reason for this lies in direct worldly perception. As we see with our worldly eyes, things are not different. If things are different from
each other why do we classify things as shoots of corn, stalks of corn and leaves of corn rather than as shoots of a trees, stalks of a trees or leaves of trees? Therefore they are not different.

(2a26) Question. If there is no difference then surely there must be arriving?

Reply. There is no arriving, and the reason for this lies in direct worldly perception. As we see with our worldly eyes, things do not arrive; for example, the sprout inside the grain of corn does not arrive from anywhere. If there were arriving the sprout would have to come from some other place, like a bird coming to roost in a tree; but in fact this is not so, and therefore Lire is no arriving.

Question. If there is no arriving then surely there must be departing?

Reply: There is no departing, and the reason for this lies in direct worldly perception. As we see with our worldly eyes, things do not depart. If there were departing we should see the sprout departing from the corn, like a snake coming out of its hole; but in fact this does not happen. Therefore there is no departing.

(2b4) Question: Although you have commented on the significance of 'no arising and no ceasing', we should like to hear the exposition of the one who composed the treatise.

Reply:

CANDRAKĪRTI COMMENTARY

[Commentary on the Dedication is included in the Introductory section above.]

KALUPAHANA COMMENTARY

These introductory verses appear to be equivocal and therefore could account for most of the conflicting views in the two major Madhyamika traditions: (1) those of the Prasangikas, represented by Candrakīrti and attributed by him to the earlier Madhyamika philosophers like Aryadeva and Buddhapalita, who recognized no views and merely utilized the reductio ad absurdum method to refute the views of their opponents; and (2) those of the Svatantrikas, reprinted by Bhavaviveka, who admitted a positive thesis on the basis of which they criticized the opponents' views. In these verses, the contents of the Buddha's discourse are all referred to in the accusative case as anirodham, anutpadam, anucchedam, asasvatam anekartham, ananartham, anagamam, anirgamam, pratityasamutpadam prapancopasamam, sivam without giving any indication as to whether they refer to one doctrine or several.

Modern interpreters of Nagarjuna, probably following Candrakīrti, whose commentary, the Prasannapada, is the only one available in its original Sanskrit, have assumed that all these terms refer to one doctrine, namely, dependent arising (pratityasamutpada). Accepting both the general or distributive meaning and the particular usage of the term, he explains dependent arising as “the arising of things contingent upon causes and conditions” (hetupratyayapekso bhavanam upadah pratityasamutpadh), contrasting it with the definition offered by those who accepted a theory of momentariness (ksanika-vada). According to the latter dependent arising means “the arising of those that are repeatedly destroyed,” (prati prati ityanam vinasinam samutpada iti, loc. cit.). In fact, Candrakīrti seems to defend some sort of “radical empiricism” when he raises the question: “How can one maintain that there is arising of that which has reached another without obtaining a relation?” (Katham anenaiva prapteh sambhava ita yuktyanupadanena, p. 9). He continues to emphasize Nagarjuna's view that "whatever that has arisen reaching such and such, that is not arisen in terms of self-nature" (tat tat prapya samutpannam notpannam tat svabhavatah, pp. 9, 10). This certainly means that the negations in the dedicatory verse are intended to deny that things are arisen through self-nature (svabhavatah) and there seems to be no implication that they are applicable to dependent arising itself. However, a change of perspective appears when Candrakīrti proceeds to explain the principle of dependent arising (pratityasamutpada). Instead of taking dependent arising as the positive middle position of the Buddha, Candrakīrti applies the negations to dependent arising itself, as if the
negations are presented as adjectives qualifying dependent arising. Hence his statement: "The entire treatise [i.e. the Karika] purports to establish the absence of cessation, etc. of dependent arising," (nirodhadayo na santi pratityasamutpadasya, p. 11). This leads Candrakīrti to a position of "no-views" which is then identified with the "app easement of obsessions" (prapancopasama) or freedom (nirvana), thereby emphasizing its transcendence. Quotations from Nagarjuna as well as Aryadeva are presented as justification for this identification of "dependent arising" and "app easement of obsessions" (p. 16), even though Nagarjuna seems to distinguish between utilizing right views (such as dependent arising) without grasping on to them as the absolute truth. With this interpretation of the negations, the dependent arising and freedom, Candrakīrti then moves on to the contents of Nagarjuna's first chapter on the examination of "conditions" (pratyaya) and involves himself in a lengthy discussion of the Prasangika and Svatantrika standpoints.

-2. Svatantrika interpretation. It is possible to interpret these eleven characterizations as expressing three major aspects of the Buddha's discourse:

  a) The eight negations may be taken as a refutation of the false views (mithya-drsti), primarily the theories of substantial existence (astitva) and nihilistic non-existence (nastitva), that is, the non-ceasing (aniruddham) of a substantial entity and the non-arising (anutpadam) of a nonexistent entity. Indeed, the non-ceased (aniruddham) and non-arisen (anutpannam) are equivalent to the non-existent (asunya), a term used to refer to substance (svabhava) (XX.17). Hence these negations appear in couplets and could be considered as another way of presenting the non-substantiality (anatman) not only of phenomena but also of those views. They are non-substantial in the sense that they are not absolute, as they were assumed to be by their proponents.

  b) "Dependent arising" (pratityasamutpada) would then stand for the middle position, which is the right view (samyag-drsti) on the basis of which the wrong views are criticized. "Dependent arising" is considered to be the right view, not because it is an absolute truth, but because it allows for possible explanations of phenomena not permitted by theories of absolute existence and nihilistic non-existence.

  c) "The appeasement of obsessions" (prapancopasama) and "the auspicious" (siva) would be the result of adopting the middle position. This is freedom or nirvana.

Interpreted as such, these verses refer to a positive core of the Buddha's teachings, alongside of the negative aspect which was intended as a rejection of the heretical views. Such an interpretation would leave dependent arising as the position from which the Buddha rejected the metaphysical or absolute views and this would support the Svatantrika understanding of Nagarjuna. If the analysis of Nagarjuna's philosophy is undertaken in the light of the "Discourse to Katyayana," as is done in the Introduction to the present work, the above interpretation of the dedicatory verses may appear to be more in conformity with the Buddha's own teachings. Such an interpretation would present the Karikas as a compact and well-organized composition and eliminate the need to prune portions of the text as being irrelevant or inessential to the main theme.

**GARFIELD COMMENTARY**

Dedicatory verses are often treated as mere performatives. But these are special and announce in a subtle but powerful way the program of the *Mula-madhyamaka-kārikā*. There is a common point being made in the four pairwise denials, but also a specific insight being expressed in each. The relation between the conventional and the ultimate that will be developed in the text is also expressed poetically in the dedication. In fact, Candrakīrti, in *Prasannapadā*, argues that the dedication determines the Prasangika reading of Nāgārjuna's text.

Candrakīrti’s point is this: In the four pairwise denials, Nāgārjuna is announcing that the Madhyamika philosopher will make no positive assertions about the fundamental nature of things. But this claim must be qualified in several ways. For one thing, we must take the phrase “the nature of things” very seriously. That is, Nāgārjuna will be refusing to say anything about the essence of anything exactly because he will deny the coherence and utility of the concept of an essence. For another, it is important to see that the predications that are rejected are intended to be understood as made from the ultimate standpoint. That is, the assertions that are being denied are assertions about the final nature of phenomena that emerge from philosophical analysis. They are not meant to be ordinary assertions dependent upon conventions. Nāgārjuna will deny that it is possible to assert anything from the ultimate standpoint. He will urge that all truth is relative and conventional. In fact, as we shall see, these qualifications turn out to be mutually entailing.

But each pair is significant in its own right. To say that “whatever is dependently arisen is unceasing and unborn” is to emphasize that dependent arising amounts to emptiness, and emptiness amounts to nonexistence in the ultimate sense. While, as we shall see, Nāgārjuna defends the conventional existence of phenomena, he will urge that none of them
ultimately exist - that none of them exist independently of convention with identities and natures that they possess in themselves. Therefore, he will argue, nothing ultimately is born, and from the ultimate standpoint there is nothing to cease. This is a deep point, which only emerges completely through a reading of the whole text. But we can say at this point that this insight contains within it the seeds of the eventual equation of the phenomenal world with emptiness, of saṃsāra with nirvāṇa, and of the conventional and the ultimate that are the hallmarks of the Prasangika-Madhyamika view.

When Nāgārjuna claims that “whatever is dependently arisen is ... unanihilated and not permanent” he indicates that the dependently arisen world and all of its contents are, in virtue of being dependently arisen and dependent upon conditions, impermanent. Phenomena come into existence when the conditions upon which they depend obtain, and they cease to exist when the conditions for their continued existence no longer obtain. This impermanence, he will argue, entails their nonexistence from the ultimate standpoint. For there will be no principled way to assert criteria for identity for phenomena that distinguish them in any principled way from their conditions. Nor can we find any essence they themselves have that determines their identity. The criteria for identity we posit will end up being purely conventional. Hence the same is true for any claims of substantial difference between things. But this impermanence and lack of intrinsic identity, while it amounts to the impossibility of ultimate existence, is not equivalent to annihilation. The empirical reality of things, on Nāgārjuna’s analysis, is not denied by asserting their emptiness.

Finally, to assert that things are “not coming, not going” is to assert that the phenomenal world does not contain intrinsically identifiable entities that persist independently with those identities over time. As a consequence, there can be no sense in saying that any entity, independent of conventional imputation, comes into existence, remains in existence, or goes out of existence. (In 13. As Georges Dreyfus points out (personal communication), many Tibetan scholars read this line also as a comment on the selflessness of sentient beings - as indicating that there is no self that comes from previous lives and goes on to future lives.) The final remark - that the phenomenal world is free from conceptual imputation - raises a tension that is central to Madhyamika philosophy and that animates the whole of the text: The tension between the desire to characterize the ultimate nature of things and the recognition that all characterization is conventional. For Nāgārjuna will urge that all conventional phenomena are conceptually designated, depending for whatever identity and existence they have on such designation, and that this merely imputed status is their ultimate nature. Despite this, however, he will urge that seeing this fact is at the same time to see that the nature naively imputed to things and the nature they appear to us to have - inherent existence - is wholly false. In themselves, from their side, things are free of that imputation, even though there is really nothing at all that can be said from their side. This dynamic philosophical tension - a tension between the Madhyamika account of the limits of what can be coherently said and its analytical ostension of what can’t be said without paradox but must be understood - must constantly be borne in mind in reading the text. It is not an incoherent mysticism, but it is a logical tightrope act at the very limits of language and metaphysics.
Chapter I

प्रत्ययपरीक्षा नाम प्रथमं प्रकरणम्

中論觀因緣品第一(十六偈)

pratyayaparīkṣā nāma prathamaṃ prakaraṇaṃ ||

Chapter I: Examination of Conditions
We now begin the second part of this section of the treatise, which involves explaining the meaning of each chapter. This section has three parts: the demonstration that dependent origination is essentially empty, the presentation of the fact that whether one remains engaged in cyclic existence or withdraws from it depends on whether one understands that, and how, once one understands dependent origination, the erroneous views are abandoned. We now begin the first of those three parts: the demonstration that dependent origination is essentially empty by nature. This chapter constitutes the first of those two parts.

In the beginning, arising is negated with the thought that in order to explain such things as the non-ceasing presented above, it would be easier to deny the existence of such
things as cessation having already denied that of arising. This section has two parts: the refutation of the essence of the arising of effects and the refutation of the essence of conditions in that which gives rise to things.

**SUMMARY:**

Here are summaries of the following three matters: the way in which the object of negation refuted in this chapter is grasped, what is established after it is refuted through arguments, and in light of that, how to posit causes, conditions, and effects. When such things as seeds and fuel are seen or heard to be performing the action of giving rise to such things as sprouts and fire, respectively, to take both cause and effect not as merely nominally imputed, but as the objects that are the bases of nominal imputation, grasped as inherently existent produced and producer, is to grasp the object of negation.

When the object so grasped is maintained to exist in that way, through an analysis asking whether this arisen effect has the same essence as or a different essence from its causes and conditions, with respect to the effect, the essence of the produced is refuted, and when one analyzes the conditions that produce the effect, asking whether they exist or not when the cause occurs, then with respect to the cause the essence of the producers is refuted. [89] This is because Nagarjuna presents a position, the primary focus of which is refutation, according to which an inherently existent entity cannot be posited as having causes, conditions, or effects.

Here is why he does this: Since from beginningless time, we are accustomed to grasping causes and effects as existing inherently, this is difficult to dispel. When that essence is refuted, the tenability of action and agent in the context of essencelessness can easily be established. Nagarjuna does not focus here primarily on how we set out action and agent conventionally in our own system.

Arguments such as “Neither from itself nor from another” that express refutations always involve analysis of how the objects taken to be the bases of conventional imputation exist. Therefore, they refute any arising that is not merely imputed, but they do not refute mere arising. Having this clearly in mind, in most of the chapters Nagarjuna does not apply the modifying term to the object of negation. The modifying term is indeed applied in many places. He does not always explicitly apply it, thinking that it is easy to see that when it is applied in any one context, when the grounds are the same, it should be supplied in other cases even where it is not explicitly applied.

I have explained in Lam rim chen mo [580, translation by Cutler et al., III, pp. 128–129] that, according to Prasannapada, when such statements as “Dependent origination is without cessation, without arising” [4a] are shown to be noncontradictory to sutras where the existence of such things as cessation is asserted, they are taken to express the absence of such things as cessation and arising with respect to the nature of the object of uncontaminated wisdom. They refute ultimate arising, but they do not refute conventional arising. It is also explained that this is the intention behind statements in sutra that things arise from the four conditions. Even the refutation of the objective condition is said to be with respect to the ultimate and not the conventional [Prasannapada, 28b]. Therefore, it is crystal clear that the modifying term should be applied to the object of negation, and this kind of case occurs frequently. But one should not be misled by lexical glosses where this is not applied frequently.

The commentary to Catuhsataka makes this point very clearly: [90]

If one maintained that in virtue of the complete refutation of arising via this analysis, compound phenomena are presented as nonarisen, then it would not be like an illusion, but would be like something that is perceived by the son of a barren woman and the like. Lest the absurd consequence follow that there would be no dependent arising, one should not compromise with those who say this. Instead, one should consistently follow the analysis according to which they are illusionlike. [dBu ma ya 225a]

Prasannapada [89b] quotes the following statement in the Lankavatara Sutra:

I have said that all things are nonarisen meaning that they are essentially nonarisen. [mDo sde Ca 79b]

If cause and effect are refuted in the context of existence through their own characteristic, cause and effect can be taken to be merely nominally imputed, and merely posited through the force of nominal conventions. As the Buddhapalita says, in the beginning of the first chapter, “To say that something arises is merely convention” [161b], and as it says, at the very end of the chapter, “To say that something arises is to say that it merely exists conventionally” [168b].

Thus, when one sees that in the context of inherent existence it does not make any sense to accept cause and effect, since beneficial and harmful causes and effects are undeniable, they exist; and since it makes no sense to posit them in the context of inherent existence, one must accept that they are tenable only when posited as existing merely through the force of nominal convention. Since ordinary people are thoroughly habituated to positing producer and produced as existing through their own characteristics, when this is refuted, they find it awkward to posit them as existing merely through the force of nominal convention. However, since there are only these two modes of positing them, and since the first one is untenable, one should push one’s mind in the direction of the second one, since it is inevitable.

It makes no sense to think that it is untenable to say that since producer and produced exist, cause and effect exist; and therefore that they are nominally imputed. [91] The reason that this makes no sense is that, as has been explained, the word “merely” means neither that no objects exist besides names nor that their being cognized by authoritative cognition is precluded. On the other hand, although the phrase “things exist merely in virtue of nominal imputation” means that it is impossible that they exist without being posited by nominal convention, it does not mean that everything posited by nominal convention exists.

So, taking whichever of the internal and external causes and conditions is clearest as an example—such as seeds and sprouts, or consciousness arising depending on sense faculties and objects—and seeing how it is grasped in the way previously explained, and then focusing either on the
cause or on the effect, through the argument refuting their inherent existence, one should refute all of the remaining essence. If even the slightest bit is not refuted, then being bound by that grasping, liberation cannot be attained. Then causes and effects will appear to be merely nominally imputed. Then, since the benefits and harms of causes and effects are undeniable, one should develop ascertainment, thinking as follows: “Although in the context of mere imputation, causes give rise to effects, it is erroneous for me to grasp them in the context of existence through their own characteristics.” One should not allow this to undermine one’s ascertainment of the dependent arising of causes and effects. According to our own system, if these things are posited as existing conventionally in the sense of existing merely from the standpoint of illusion, and are not posited in a framework according to which there are causes and effects, this would be a great error and a great depreciation of reality.

INADA (Chapter Introductions)

CHAPTER I - Examination of Relational Condition

The term, pratyaya, has been variously rendered as yin-yuan by Kumarajiva, as causality by Stcherbatsky, as Bedingungen by Walleser. All three renditions, it must be stated, do not do complete justice to the Sanskrit original but there is a feeling that all three translators have sensed the significance of the term and concluded with the best possible term under their command in conveying the idea. This is just an example of how difficult it is to translate an original term into another language, a difficulty which is doubly so when the term is a philosophical concept.

We may perhaps venture to say at the outset that the term ought to be shorn of any notion of "cause" or "causality" as commonly interpreted. These notions would immediately set up a causal connection such that an effect or something is originated or produced out of something else. In other words, they would connotes a one-to-one, cause-effect, occurrence of events which is definitely not the true intention of the Madhyamika. For this reason, it is proposed, not without shortcomings either, to coin the phrase, "relational condition," in which the adjective, "relational" refers to the onto-logical representation of an event or subject as related to the whole situation, whether significantly or not, in a certain moment; while the noun, "condition," refers to the state of such an event or subject at that particular moment. Thus, relational condition does reflect somewhat the modern idea of a four-dimensional view of events in nature but the comparison can never be completely carried out because the former has a pre-scientific origin while the latter a strictly Western scientific base.

KALUPAHANA (CHAPTER OVERVIEWS)

Analysis of the Karika

Part-I (Causality and Change)

1. Conditions (pratyaya). The Buddha’s main philosophical insight, as has been shown, was expressed by the term “dependent arising” (paticcasamup-pada). It was presented against the four theories of self-causation, external causation, both self- and external causation and non-causation. Nagarjuna, being a true disciple of the Buddha, is therefore seen as initiating his primary philosophical treatise by categorically denying these four causal theories (1.1). According to the Buddha, the four theories imply the existence or nonexistence or both or neither, of a permanent existence, an eternal and substantial self (atman). That same implication is assumed by Nagarjuna when he used the term bhava (instead of bhava) to refer to the entities that are explained in these four ways. Thus, in the very first stanza Nagarjuna's denial pertains to a metaphysical existence (bhava) and not to the empirical notion of becoming (bhava) characterized by arising (utpada) and ceasing (vyaya).

In verse 2, Nagarjuna refers to four types of conditions (pratyaya), emphatically declaring that there is no fifth.
However, there is no categorical denial of the four conditions, compared to the denial of the four causal theories in the previous verse. The reason for this is very evident. Nagarjuna, a very sophisticated philosopher, realized that the Buddha rejected the four causal theories mentioned in verse 1. He also knew that the later Buddhist disciples (sakya) attempted to elaborate upon the Buddha’s conception of “dependent arising” (pratityasamutpada) by formulating a theory of four conditions (pratyaya); these were the early Abhidharmikas. He saw no reason for an outright rejection of the theory of four conditions. However, in verse 3, he immediately takes up a particular interpretation of a condition (pratyaya) and negates it: “The self-nature of existents is not found in the condition, etc.” It is not difficult to see what is being denied here. To Nagarjuna, it seems that some philosophers were interpreting the Buddhist (Abhidharmika) theory of four conditions (pratyaya) in terms of one or the other of the theories mentioned in verse 1, which the Buddha himself had rejected. Nagarjuna could not have been unaware of the fact that the philosophers who spoke of conditions (pratyaya) at this early period in Indian thought were the Buddhists and not the non-Buddhists. Therefore, his attention is now directed to these Buddhist interpreters and not to the non-Buddhists.

As mentioned earlier, among the Buddhists the only school that gave a substantial interpretation of phenomena (dharma) during this early period was the Sarvastivada school. Their theory of self-nature (svabhava) came dangerously close to the Indian conception of self (atman). Nagarjuna was, therefore, merely criticizing the view of the Sarvastivada school of Buddhists, who were suggesting a substantial interpretation of the four conditions. Thus, the categorical denial in stanza 3 pertains to the view of the Sarvastivadins, who assumed a self-nature or substance (svabhava) of the existent (bhava) in the conditions (pratyaya).

What sort of argument does Nagarjuna present in order to deny the existence of self-nature? Mufti and others who saw in Nagarjuna’s method a dialectic comparable to that of Immanuel Kant have considered self-nature (svabhava) and other-nature (parabhava) as antinomies. This may be true. However, such a dialectic is not used by Nagarjuna in his first refutation of the notion of self-nature. Nagarjuna rejects self-nature, not because it is relative to other-nature, but because it is not evident (na vidyate). The argument from relativity is utilized to reject other-nature only and not self-nature. (“In the absence of self-nature, other-nature is also not evident.”) What is found here is a simple and straightforward denial of self-nature on epistemological grounds, even though he does not elaborate upon that epistemology at this point.

Throughout the text, one finds Nagarjuna using the negated verb, na vidyata, and sometimes the present participle, aviayama. The former is often rendered as “not found,” and in our translation preference is given to the more epistemologically oriented rendering: “is not evident.” This emphasis is clearly evident from the manner in which he rejects “self-nature,” as explained above.

In other words, Nagarjuna appears more as an empiricist than as a dialectician who merely utilizes reason. Thus, the text begins with a simple denial of self-nature as something that is not evident. What Nagarjuna means by evidence will be explained later on in this essay. If this point is kept in mind, it becomes rather easy to understand the rest of Nagarjuna’s analysis of conditions.

Thus, in the verse that follows (1.4), Nagarjuna speaks of action (kriya) and condition (pratyaya). In this case, neither the action nor the condition is denied. What is denied is the sort of relationship that is assumed between them, that is, inherence which emphasizes identity. The denial of identity is prompted by the fact that it is equated with “self-nature” (svabhava) which, in its turn, was looked upon as a permanent entity. Difference was likewise denied because it was perceived as other-nature, which implied annihilation or lack of any continuity.

Verse 5 takes up the definition of a condition. A condition is such because depending upon it others arise. However, the reason why Nagarjuna rejects this definition is not that it is not empirically valid, but that there is a rider attached to the definition. That rider implies that this dependence is eternal and permanent. In other words, that which is dependent and that upon which it depends are substantially connected through a relation of inherence. Hence, Nagarjuna’s question: “So long as it [the effect] does not arise, why is it [the cause] not considered to be a non-condition?”

Verse 6 completes Nagarjuna’s general criticism of conditions. Most modern translators have failed to bring out the significance of this verse, primarily because the term artha (= effect, fruit, result, rendered into Chinese as kuo) failed to attract their attention. What is denied is, therefore, not the arising of an effect as ordinarily understood, but the arising of an effect that is already existent (sato arthasya) or one that is non-existent (asato arthasya). These again represent the identity (satkarya) or the non-identity (asatkarya) theories of causation presented by the Sarvastivadins and the Sautrantikas.
Verses 7-10 represent the criticism of the four types of conditions referred to at I.2 as interpreted by the Sarvastivadins and the Sautrantikas. If the sat (existent) and asat (non-existent) qualifying dharma (phenomena) are understood as implying “the substantially (svabhavato) existent and non-existent,” a qualification that Nagarjuna often makes, then it will be easy to understand the nature of Nagarjuna’s criticism. This is especially so in verse 10 where, on the surface, it appears that Nagarjuna was criticizing the Buddha’s own statement: “When that exists, this comes to be,” (asmim satidam bhavati). However, Nagarjuna was very careful in dealing with this statement, for in the first line he was explicit with regard to the sort of existence he was criticizing, that existence being none other that “substantial existence” (sat-ta). Verses 11-14 deal with several other aspects of the theory of causation such as the arising of an effect from a combination of conditions. It is indeed the concluding line of the last verse (1.14) that possibly can give rise to all the misunderstanding regarding Nagarjuna’s analysis of causal conditions. “In the absence of the effect, whence can there be a condition or a non-condition.” It is easy to interpret this statement to mean that Nagarjuna did not accept either a cause or an effect that is dependent upon a cause. To take it as a simple denial of cause and effect would be to ignore everything that Nagarjuna has been trying to say earlier in the chapter, regarding self-nature (svabhava) or substantial or permanent existence (sat). There seems to be no rationale for interpreting this statement independent of the basic premises with which he set out on his examination of conditions. To conclude: What is denied here is not the simple effect that depends upon the condition or conditions for its arising, but an effect that is either pre-existent, and therefore permanent, or nonexistent because it is not pre-existent. It is also reasonable to assume that a similar denial pertains not to a simple cause or condition but to a cause or condition that produces an already existent or non-existent effect. “Dependent arising” or casualty (pratityasamutpada) was, to reiterate, the principle in terms of which the Buddha was able to explain the functioning of phenomena (dharma) without resorting to a conception of permanent and eternal entity (nitya atman). In other words, dependent arising explains the impermanence (anitya) of phenomena that are dependently arisen (pratityasamutpanna) without which no identification of “dependent arising” is possible. Because such phenomena are dependently arise, they are impermanent (anitya). Impermanence involves change and movement.

**BATCHelor (poetic “translation”)**

Conditions

Nothing comes from itself
Or something else
Or both together
Or without a cause.

The essence of a thing
Is never to be found
In causes or precursors,
Consciousness or objects-For if a thing is not itself,
How can it he something else?

I too did not appear
Either with conditions
Or without them:
They became my conditions
Only when I sprang from them,
Not before.

Whether I am there or not,
Conditions are impossible –
For in my absence,
Whose conditions would they be?
And in my presence,
What purpose would they serve?

You cannot say:
“When this is present, that happens” –
For the presence of an inessential thing
Is never to be found.

How can conditions cause
Something unconnected to them?
Why could I not have been born
From causes that were not my conditions?

How could my nature be conditioned
When conditions have no nature of their own?
How could it ever he my nature
To be without conditions?
1. Conditions

This chapter is not about causation in the scientific sense, although translations and discussions of Nagarjuna suggest that it is. Rather, it is about the origin of things – how things are produced. It begins with a declaration – “no entities whatsoever are found anywhere that have arisen from themselves, from another, from both themselves and another, or from no cause at all” - with no reasons given. But the reasons can be constructed from other verses in the Karikas:

(i) Nothing can be self-caused because it would already have to exist to be the cause. In short, nothing can produce itself. (This would include a god, no matter what the advocates of the Cosmological Argument think. See Jones 2009: 137-39.) Nothing can produce itself through its own power nothing is “self-existent.” “Self-existence” or “self-causation” would simply render the concept of “causation” meaningless.

(ii) Nothing real can be caused by another reality since it would then be dependent on that reality and thus by definition it would not be real. In addition, something could arise from another thing only if that other thing was itself real (i.e., self-existent), but since there is no self-existence that other thing also is not real.

(iii) Nothing can be caused by the combination of itself and something else: the two possibilities were ruled out in (i) and (ii), and so the combination of them will not work either. That is, the combination of a thing and another thing would not be real since neither part is real (self-existent).

(iv) Nothing arises without a cause. In emptiness metaphysics, everything arises dependent upon causes and conditions - nothing is causeless. In self-existence metaphysics, to be causeless is to be in effect self-caused, which has already been ruled out.

The first option can be seen as a rejection of the Samkhya position that the effect is in the cause; the second of Jaina’s position on a creator; the third of Vaisheshika’s position on multiple causes (material and instrumental); and the fourth of the position of Indian materialists (Lokayata/Charvaka) that there is only chance and causelessness (Wayman 1977T 11-12).

The point of verse 1 is that since there are no options other than these four, all things lack self-existence (svabhava) and thus are empty (shunya). Furthermore, all empty things are causeless since there are no real (self-existent) entities to be a real cause or a real effect.

The causes and conditions of verse 2 are these: an efficient cause with the power to bring about an effect (hetu) and the three conditions in the Abhidharma analysis. (Reason and cause are not differentiated in the concept of “hetu.”) The “objective support” is the object in the world that permits our perception of it. The “continuity” is the connection to a continuing series of events in the world or moments of consciousness. The “influence” is something like the Aristotelian “final” cause: the purpose for which an action is undertaken.

Verse 3 says that activity, like physical entities, is also not separate from its conditions. Verse 4 sounds like a contradiction in terms: “Activity does not have conditions, nor does it not have conditions. Moreover, conditions do not exist with the power to act, nor without the power to act.” But this can be seen as consistent if we utilize the doctrine of “two truths” (24.8-10): from a conventional point of view, activity has no conditions and has the power to act; but from an ultimate point of view, it is not self-existent but has conditions, and so it has no independent power to act but is conditioned by other activity and entities. This pattern of mixing both points of view occurs throughout the Karikas, but Nagarjuna has one consistent position throughout: there are no self-existent entities, properties, or activities, and there are worldly phenomena that arise and fall dependent upon conditions.

In verse 5, Nagarjuna is arguing that if the conditions exist before the thing dependent upon them arise, then how can they then be called “conditions”? They only become conditions as things arise dependently on them.

What does not exist at all (asat) obviously cannot have conditions (since it does not exist), and what is real (sat) does not need conditions (to be real is to be self-existent and thus to exist independently and without reliance on anything else) (vv. 6, 8). So how can there be conditions? So too, the fundamental factors of the experienced world (dharmas) are without svabhava and thus they too are not realities that could really arise or cease or be a real cause.

Since nothing real truly arises, there is nothing real that could cease, and thus no true conditionality is involved (v. 9). And if something real possibly had arisen and then ceased, conditions are no longer possible. And with no self-existent entities, there is nothing real to be the cause or condition for something else (v. 10).

An effect is not already in the conditions or we would see it there; but if it is not in the conditions and yet still arises, it is not related to the conditions at all (vv. 11-12). If the conditions are not real, how can any effect arising from them be real (v. 13)? If there is no real effect, then there is nothing to label a “condition;” and if there is nothing to label a “condition,” then there is nothing to contrast as a “non-condition” (v. 14).
Gyamtso (Commentary)

1

An Examination of Causal Conditions

In the Sutra Requested by Madropa, the Buddha said:

Whatever arises from conditions does not arise.  
It does not have the nature of arising.  
Whatever depends on conditions is explained to be empty.  
And to know emptiness is the way to be conscientious.

IN THIS CHAPTER, Nagarjuna explains the meaning of this passage and proves its validity with logical reasoning. The reason Nagarjuna composed this chapter was that people believe that causal conditions are real. As a result of that, they believe that things really happen. They believe that arising is real. When they believe that, it is difficult for them to believe in emptiness and to gain confidence that all phenomena are empty of inherent existence. However, in order to understand the true nature of reality, we must realize that nothing ever really happens. We must realize that arising and birth are not real. Therefore, Nagarjuna analyzes causes, conditions, and arising, and he proves that they are in fact empty of any inherent nature.

Let us begin by looking at this verse spoken by the Buddha. Whatever thing it might be in samsara or nirvana, it can come into existence only in dependence upon its specific causes and conditions. There is nothing that can arise; there is no event of arising at all that can occur without the presence of these causes and conditions to make it happen. This holds for the arising of all the impure phenomena of samsara and all the pure phenomena of nirvana. Whatever arising is, it can occur only in dependence upon a specific gathering of causes and conditions. Otherwise it will not take place.

Furthermore, whatever arises in dependence upon causes and conditions does not truly arise. One way to understand this is to see that it is not the case that just one single cause or one single condition can bring something into existence, but rather, that many causes and conditions must come together for any one particular result to arise.

Thus, if we look at any particular result and first see that it requires a number of causes and conditions to come together to produce it, we can then look at those causes and conditions and see that each one of them as well requires an incredible number of causes and conditions to cause it to arise. We can go back and back and get to even the most subtle causes and conditions, and we find that these too do not exist independently, but rather can only exist in dependence upon a multitude of their own causes and conditions. Then we realize that nothing exists independently with a nature of its own, that there is nothing truly there. Everything is like a dream and an illusion.

The same can be said for all of the thoughts that arise in our minds, whether they are good thoughts, bad thoughts, or neutral ones. There is not a single thought that can arise on its own, that can decide to come to existence and then be born. Thoughts can arise only when many causes and conditions come together to produce them. Since these causes and conditions also exist only in dependence upon their own causes and conditions, and those causes and conditions themselves need their own causes and conditions in order to arise, and on and on, all of them are empty of inherent existence. The arising of thoughts is therefore empty of any inherent nature.

In this way, we can see that whatever arises in dependence upon causes and conditions is empty of true existence because it does not really arise at all. To know this emptiness is the best way to be conscientious. The reason for this is that everything we experience in this life is appearance-emptiness; however, if we think it is real, we can try very hard to be conscientious, but in fact our confusion about the basic nature of our experiences will make us careless. On the other hand, those who gain stable certainty that their experiences are appearance-emptiness, and are therefore no more real than illusions, correctly understand the true nature of things, and even if they appear to us to be careless, they are in fact more conscientious than anyone!

The first verse of this chapter reads:

Not from self, not from other,  
Not from both, nor without cause:  
Things do not arise  
At any place, at any time.

This verse proves that things do not arise because they do not arise from any of the four extremes: They do not arise from themselves, from something other than themselves, from both themselves and something other than themselves, and they do not arise without any cause at all. These are the only four possible ways in which things could arise, and since none of them are valid, things do not truly arise. Therefore, things do not truly exist.

Why do things not arise from themselves? If they did, the term arising would be meaningless. When something is said to arise, this means that it comes into existence anew. However, if things arose from themselves, they would have to first exist in order to then arise from themselves! What would be the point of saying that something “arose” after it was already existent? Why would it have to arise at that point? That is one flaw in this argument.

Another flaw in this position is that if things did indeed arise from themselves, their arising would never end. This is the case because if things arose after they already existed, what would stop their arising? What we observe in the world is that the process of arising stops when the thing that has
arisen fully exists. As described above, however, if things arose from themselves, they would have to exist first in order to be there to produce themselves. They would have to arise again even after they existed. They would exist, then arise, then exist, then arise, and what would ever stop them from needing to arise again and yet again? Arising would thus go on forever.

Things do not arise from something different from themselves, either, because if they did, they would arise from things that were not their causes as well as from things that were their causes. Here, when we say that two things are different from each other, it means that they have no connection between them—they are separate and completely independent entities. They are like a horse and a cow.

Therefore, if things arose from other things that were completely separate and independent from themselves, they would be able to arise from anything at all. No connection or relationship would be necessary for one thing to be able to produce another. Darkness would arise from fire, barley would grow from wheat seeds, and so forth. There would be no reason this could not happen, because different things would be arising from different things.

Another reason things do not arise from something different from themselves is that if they did, cause and result would have to exist at the same time. For two things to be different from each other, there have to be two things to begin with. If there is only one thing, what is it different from? Take the example of a seed and a sprout. If the sprout truly arises from the seed that is different from itself, then the sprout and seed would have to exist simultaneously in order to be different from each other. If only one existed at any one time, it would not have the other one there to be different from itself.

However, cause and result do not coexist—they are sequential. When the seed exists, the sprout does not, and when the sprout exists, the seed does not. Therefore, the seed and the sprout cannot be said to be different from each other because only one exists at a time. They never exist simultaneously, so no comparison between them can ever be made. We cannot say that they are two different things because there are never “two” there together—there is only one of them present at any one time. The sprout therefore cannot be said to arise from a seed that is different from itself, and in this way, arising from other is refuted.

The third possibility is that things arise from both themselves and something other than themselves. The problem with this is that all the faults inherent in the first two positions accrue to this third one. Combining wrong view number one and wrong view number two does not erase the faults of the first two views—it just combines them together into doubly wrong view number three.

The fourth possibility is that things arise without any cause at all. If they did, however, then they would either always arise or never arise. This would be the case because the arising of things would not be related to causes and conditions. Thus, a result would always arise because, since its arising would not depend on causes and conditions, it would arise whether its causes and conditions came together or not; or it would never arise because, since it would not have any relation to its causes and conditions, even if they came together they could not produce it.

Furthermore, if things arose without cause, then all the effort people in the world put into bringing things into being would be in vain. Why would farmers plant seeds if harvests would arise without any cause? We can thus see that this fourth possibility is refuted by our own direct experience of the world.

Arising, therefore, does not occur in any one of these four possible ways, and therefore it is not real. What then is the nature of the arising that we see happening in the world all the time? It is mere appearance, just like the arising that appears to happen in dreams. As long as we dream and do not know that we are dreaming, we believe that the arising we see happening in the dream is real. As soon as we recognize that we are dreaming, however, we know that the arising is just a mere appearance that has no reality to it at all. In terms of the ultimate nature of the dream, it transcends both notions of “real” and “false”—it is the equality of real and false that transcends conceptual fabrication.

The same is true for daytime appearances of arising. When we do not analyze them, they appear to be real and we think they are real. At the level of slight analysis, we can apply the reasonings described above and find that the arising is not real after all—it is just mere appearance. Finally, at the level of thorough analysis, we discover that the true nature of arising transcends existence and nonexistence—it is the equality of both. This is how the three stages of no analysis, slight analysis, and thorough analysis apply to the arising that appears in daytime and in dreams.

In the tradition of Mahamudra, the profound set of instructions that describe the true nature of mind and how to meditate upon it, it is explained that mind does not arise, abide, or cease. It is from analyzing in the way that is described in this chapter that you can come to understand that. The same is true for suffering—suffering does not arise from any one of the four extremes, and therefore it does not really happen. It does not truly arise, remain, or cease. However, because of our confused belief that suffering does truly occur, we think that we suffer, while in fact we really do not.

Along these lines, in his song No Birth, No Base, and Union, the lord of yogis Milarepa sang:
The true nature of appearances is that they’ve never been born.
If birth seems to happen, it’s just clinging, nothing more.
The spinning wheel of existence has neither a base nor a root.
If there is a base or root, that’s only a thought.

It is important to know what Milarepa taught about these things. The very identity of what things are is that they never happen; they never come into existence. Then what is happening when we seem to perceive things arising? It is just our clinging, our mistaken perception of something that is not really there. Similarly, the nature of samsara’s cycle of existence is that it has no ground, no identifiable basis, support, or origin. When we believe there is some basis or root of our existence, it is only our own confused thoughts that believe it, and nothing more than that.

It is very important to separate the way things appear from the way they truly are. As long as we do not do that, we will continue to think that our confused mode of perception is valid, and we will never gain liberation from the suffering that this confusion causes us. We have to begin to see that the true nature of reality is not as it superficially appears to us to be.
Causation

Having dealt with some important formal aspects of Nāgārjuna’s arguments chiefly connected with the notion of negation, we are now equipped to explore further ramifications of the Mādhyamika’s rejection of svabhāva outlined in chapter 2. Apart from Nāgārjuna’s general arguments against the existence of svabhāva presented there, we also find in his writings specific investigations of phenomena arguing that these in particular lack svabhāva. In fact a large part of Nāgārjuna’s writings can be best understood as an examination of various classes of things with the aim of establishing their emptiness. The phenomena examined are those that constitute a particularly important part of our view of the world and that are therefore the most likely places where the mistaken ascription of svabhāva could arise. In the next five chapters we will investigate Nāgārjuna’s arguments concerning five such phenomena: causation, motion, the self, epistemology, and language.

The fundamentality of causation for making sense of our experiences need hardly be stressed. The notions of cause and effect provide us with one of the most fundamental set of tools we use to gain cognitive access to the world. Motion might strike us as a somewhat less central topic, but it is important to keep in mind its importance in the Indian mindset in which this discussion originates. Motion, not so much in the literal sense but in the sense of moving from one life to the next (the succession of one mental state by the following one provides a small-scale example), the traversing of saṃsāra in an infinite succession of existences, is an essential feature of the Indian (and more specifically Buddhist) view of the world. The self appears to be the entity that does this traversing, and it provides us with what seems to be the most important notion of them all. Viewing ourselves as a self, a subject, a responsible agent, appears to be indispensable for our conception of what we are. It provides the focal point of our cognitive life, the place where the disconcertingly diverse array of different experiences comes together and is unified in a view of the world from a unique perspective. This self interacts with the world around it in a variety of ways. The description of its direct cognitive interaction with its surroundings is the province of epistemology; this analyzes how parts of the world can become parts of our mind, in short, how knowledge is acquired. However, our interaction with the world is not completely solitary. We do not just read off information from the world but also conceptualize it in a variety of ways in order to share it with others. Our primary tool for framing and sharing bits of information is language.

Arguing for the nonexistence of svabhāva by examining different kinds of things one-by-one is of course beset with a fundamental problem. Because there might be infinitely many or at least an indefinite number of things, we are unlikely ever to conclude our investigation and to establish the thesis of universal emptiness. The Madhyamaka tradition does of course offer arguments which are proposed to work as general arguments for emptiness (such as the five types of arguments discussed in chapter 2). However, we could equally argue that the absence of any master argument for emptiness might constitute not a difficulty, but an inescapable consequence of Madhyamaka epistemology. Since the Mādhyaṃika regards nothing as being intrinsically a means of knowledge, what establishes emptiness in one context might fail to do so in another.¹ In any case there is hardly any doubt about the centrality of the five phenomena just introduced. Regardless of our view of its consequences for establishing the general thesis of emptiness, a demonstration of the absence of svabhāva in each of them would have fundamental consequences for our view of the world, of ourselves, and of the relation between the two.

5.1. Causation: Preliminary Remarks

Nāgārjuna’s treatment of causation is an examination of different attempts to analyze the relation between cause and effect which employ a variety of familiar

¹ Siderits (2003: 147); see also the discussion in chapter 8 of this volume.
and (and least *prima facie* unproblematic) conceptual frameworks. Causation being a two-place relation, we will want to investigate the identity relation between its relata: are cause and effect the same or different, or are some identical and some different? Are cause and effect related as part and whole? Or are there perhaps no items instantiating the causal relation at all? Since causation takes place in time, we will want to investigate the temporal relation between cause and effect: are they successive events, or simultaneous, or overlapping, or are cause and effect just two aspects of a single unified event?

The interesting fact about Nāgārjuna’s discussion of these analyses is that he sets out to show that they are all equally unsatisfactory: cause and effect are argued to be neither identical nor different nor related as part and whole, they are neither successive, nor simultaneous, nor overlapping, and so forth. In itself such a discussion would show little more than that the philosopher in question had failed to come up with a satisfactory theory of causation. It would at best be interesting for the criticism leveled against other positions but would hardly constitute a unified philosophical outlook on its own.

In order to see the point of Nāgārjuna’s arguments, however, it is essential to understand that he takes the possible analyses of causation examined to be exhaustive: any view one could possibly hold concerning the identity relation or the temporal relation between cause and effect can be subsumed under one of the alternatives considered. If Nāgārjuna is successful in showing that all the alternatives are deficient, there is only one conclusion to be drawn. The conceptual frameworks that these different analyses employ must be based on a mistaken presupposition.

Suppose there was some peculiar theory that tried to find out what shape the color red was. This process could proceed by one’s listing all the possible shapes the color red could be, and then examining them one by one, until the right one was found. Unsurprisingly, we would find that the color red is neither circular, nor triangular, nor rectangular, nor any other shape, since while there are doubtlessly examples of such shapes that are colored red, the color itself, being a property, does not have any of these shapes. The explanation for our inability to come up with a satisfactory answer to the question “What is the shape of the color red?” is that it is built on the mistaken presupposition that the color red has a shape at all. In the same way, Nāgārjuna wants to argue that our inability

2. The reader familiar with Greek philosophy will realize that many of Nāgārjuna’s arguments concerning causation bear strong similarities to classical sceptical arguments as, e.g., presented in the third book of Sextus Empiricus’s *Outlines of Scepticism*. Since the present discussion is not an attempt at comparative philosophy, I will not discuss these resemblances here. The interested reader is referred to McEvilley (1982), who even addresses the question of whether Nāgārjuna’s arguments might be derived from Greek works (28). For a broader discussion of possible Greco-Indian philosophical interactions, see McEvilley (2002).

to come up with a satisfactory answer to the question of whether cause and effect are identical or different is due to another faulty presupposition. This is the presupposition that cause and effect exist with their own *svabhāva*, that is, that they are independent and self-sufficient entities.

Cause and effect existing with their own *svabhāva* first of all means that cause and effect are qualitatively and therefore also quantitatively distinct objects. *They do not require one another*: first the seed exists without any need for the tree it will later produce; later, after the seed has produced the tree, the seed has stopped to exist and the tree will exist without any need for the seed to still be around. Second, the existence of cause and effect as “independent objects” or as “existing from their own side” refers not just to their mutually independent existence, but also to their *independence of a cognizing subject*. According to such an objectivist understanding of causation, the interlocking chain of causes and effects is something that exists in the world independent of any observers. It might be a transfer of energy from cause to effect, the cause’s raising the objective chance of the effect happening, or perhaps an unanalyzable, primitive causal relation, but in each case it is something that remains independent of human expectations and conceptualizations.

Nāgārjuna argues that this commonsensical view of cause and effect constitutes the basis of the conceptual framework we employ in order to analyze causation. Should it now turn out, as Nāgārjuna sets out to demonstrate, that there is something problematic with *all* the analyses usually encountered, this finding would provide an argument for questioning the commonsensical view of cause and effect underlying all of them.

Before investigating different accounts of causation, however, we have to consider further what Nāgārjuna means by the lack of independence and therefore the interdependence of cause and effect.

5.2. Interdependence of Cause and Effect

In order to get a clear conception of Nāgārjuna’s view of the interdependence of cause and effect, it is necessary to understand that his analysis of causation

5. Such an objectivist understanding of causation is entailed by the Ābhidharmika’s claim that primary existents (*dravya*) can be dependent on causes and conditions. For if the existence of these primary existents is mind-independent, then the existence of one such object, a conditioned object (*samskṛta dharma*), that is an effect, cannot depend on another one by a relation that is itself mind-dependent. This point is elaborated in Siderits (2004: 410 –413).
does not distinguish just two notions, cause and effect, but three. This is so because a cause does not bring about an effect on its own but does so only against a background of supporting condition. A spark does not cause an explosion on its own, but only in the presence of oxygen, fuel, a suitable temperature, and so on. The Madhyamaka analysis of causation therefore includes reference to a collection of background conditions. Nāgārjuna refers to the cause together with the background conditions as a “complete collection” (sāmagrī); we shall employ the term causal field. Nāgārjuna asserts in a variety of places that cause and effect are interdependent and can be conceived of only in such an interdependent fashion. It is apparent, however, that the dependence of an effect on a cause must be very different from the dependence of a cause on an effect. An effect depends for its existence on its cause: had the cause not existed, the effect would not have existed either. A cause, on the other hand, can exist without causing any effect, it would just not be described as a cause in this case. The fact that some particular acorn does not produce an oak tree does not mean the acorn does not exist, only that we do not refer to it as “the cause of an oak tree.” This label is attached to it not because of some internal property, but simply because it stands in a particular relation to another object, namely the oak tree. In the absence of the oak tree there would be no relation to that oak tree, so the label would be inapplicable.

If we take into account the distinction between existential and notional dependence described in chapter 2, it is clear that some of the dependence relations Nāgārjuna asserts to hold between cause and effect are quite straightforward. Cause and effect are notionally dependent on one another. If anything

6. Kalupahana (1991: 61). It is interesting to note that the distinction between cause (hetu) and supporting conditions (pratītya) is not found in early Buddhist texts (Ronkin [2005: 222]), where the two terms are often used interchangeably. Kalupahana (1975: 59) notes that “While recognizing several factors that are necessary to produce an effect, it [i.e. early Buddhism] does not select one from a set of jointly sufficient conditions and presents it as the cause of the effect. [. . .] Thus, although there are several factors, all of them constitute one system or event and therefore are referred to in the singular.” See also Ronkin (2005: 206). The distinction between cause and condition as two different elements involved in the causal relation is due to the Sarvāstivādins (Frauwallner [1995: 199–201], Ronkin [2005: 221–232]) and coheres well with their distinction between primary existents or substances (dravya) and secondary existents (prajñaptī) (Williams [1981: 237]). The cause of a particular secondary existent would be regarded as the primary existents on which it is based, while its conditions could be seen as whatever causes its properties as a secondary existent. See Kalupahana (1975: 60–66).

7. Nāgārjuna makes the additional claim that everything is existentially dependent on its cause, since “no object whatsoever exists without being caused” (na cāsty arthah. kaścid āhetukah. kvacit. MMK 4:2).

8. In MMK 1:5 Nāgārjuna states that “something is called ‘condition’ because in dependence on it something else arises. But as long as the second something does not arise, why do we not refer to the first something as a ‘non-condition’?” (hetupadate pratītyemān itīme pratītyaḥ. kila / yāvan notpadata ime tāvan nāpratītyaḥ. katham). In 10:9 he argues that if the dependence of cause and effect held in only one way, i.e. if fire (the effect) depended on fuel (the cause) but not vice versa, this would imply the absurd consequence that the cause could exist as a cause without the effect existing. (vad indhanam apeksyāgīr [. . .] evam samādhanam. cāpi bhavāyati niragnikam.).

falls under the concept “cause,” something will fall under the concept “effect,” and vice versa. The effect also depends existentially on its cause, since in the absence of the cause, the effect would not exist.

The main problem for understanding the supposed symmetric dependence between cause and effect lies in the assumption of the existential dependence of the cause on the effect. After all, as we have just seen in the case of the acorn (the cause) and oak tree (the effect), the latter failing to exist does not obliterate the former, so that we can at best speak of notional dependence in this context.

There are three distinct ways in which we can make sense of the existential dependence of the cause on the effect. First we can argue that if Nāgārjuna is arguing against an opponent who holds that a cause has its property of being a cause essentially its notional dependence on the effect will entail its existential dependence. For something being a cause essentially means that this is a property it could not lose without ceasing to be that very object. But since the presence of this property depends on existence of the effect, the existence of the cause as that very object also depends on the existence of the effect.

A second interpretation which does not have to assume that causes are essentially causes argues that Nāgārjuna intends to refer not to the existential dependence of some particular cause on its effect but rather to the existential dependence of the property of being a cause on the property of being an effect.

As should be clear from our earlier remarks, if an object a falling under property F notionally depends on something falling under G, this means that the property F existentially depends on the property G, since F can exist only if some object falls under the property “identical with the property G,” that is, if the property G exists.

The property “Northern England” depends existentially on the property “Southern England,” even though the objects falling under each do not existentially depend on one another. This is so because one property could not exist without the other one, but the objects falling under them could. Nāgārjuna refers to this existential dependence of properties on one another in RĀ 1:49:

When there is no “short” there is no “long,” they are without substance. When there is no lamp, there is no light.

9. hrasve 'sati purāttaḥ. bhavāya asväbhāvāvat. / pradhāpasyāpya amuttaḥ prabhāyā apy asam. bhavah. / Kalupahana (1975: 97) interprets this statement of Nāgārjuna as “a rare interpretation of the causal principle.” This seems to be getting the order of concepts in the development of Nāgārjuna’s thought the wrong way round. For him the notion of a dependence relation between objects is the more general concept, which can take a number of specific forms (such as mereological, causal, and cognitive dependence). Dependence is not a specific interpretation of causality, but causality is a specific interpretation of dependence.
The existential dependence of the effect (the light) on the cause (the lamp) is here equated with the way the properties "long" and "short" depend on one another—in each case the latter could not exist if the former did not exist.

According to this interpretation, we would therefore conclude that Nāgārjuna means to say that the properties "being a cause" and "being an effect" depend existentially on one another, even though the existential dependence of objects falling under them is not symmetric: the effect depends existentially on the cause, but the cause does not need the effect for its existence.

The third, stronger reading claims that while Nāgārjuna undoubtedly also wanted to assert the existential dependence of the properties "being a cause" and "being an effect," he moreover made the claim that not only does the particular object which is the cause need the cause for its existence, but the cause also needs the effect.

Such a reading can be supported if one considers an entire causal field rather than just particular causes. A causal field is a cognitive artifact, a collection of objects assembled with the sole purpose of explaining why a particular effect came about. If it is divorced from this explanatory role, there is no reason for introducing the concept at all. We might therefore want to argue that the causal field also depends for its existence on the effect it produces. This is of course not to say that every member of the causal field existentially depended on the effect they jointly bring about: the spark, petrol, and so forth would still exist, even if they for some reason did not manage to bring about an explosion. But the collection exists only if there is some effect it causes. Whether we want to argue that a causal field depends for its existence on the effect it brings about is intimately connected with our view of the existence of collections. We might think that whenever there are some objects there is the collection of those objects. Or we might deny that every arbitrary assembly of objects constitutes a collection. We would then argue that for some objects to form a collection there must be something that makes them hold together as a collection, for example that they all exemplify a property, or that they were put together for a specific purpose. If we adopt the first view of collections, then clearly a causal field will depend only nominally on its effect, since "being a causal field bringing about that effect" is only one way in which we can refer to the preexistent collection that contains all the elements of the causal field, but not to anything that brings it about. If we adopt the second conception, however, it may be the case that the only thing that binds all the members of the causal field together.

11. "Because the effect is absent, where would conditions or non-conditions come from?" phalābhāvāt pratayāpratayāh. kutah. . MMK 1:14b.

is that they are considered to be the things that jointly bring about a particular effect. In the absence of this effect, the collection disintegrates and ceases to exist. Nāgārjuna seems to favor the second interpretation when he asserts that a cause could not exist without an effect. But it is significant that what is denied here is not just the ascription of the label "cause" to some object because it is related to some other object, the effect, but the existence of the cause in the absence of the effect. Nāgārjuna endorses not just the uncontroversial notional dependence of the cause on its effect, but its existential dependence as well. Applied to the discussion of causal fields, this view implies that a causal field can exist only if the effect it brings about does, and for this reason it cannot be taken to exist whenever all of its members do.

If we adopt this third, stronger reading, then we have to conclude that for Nāgārjuna causes and effects are both notionally and existentially dependent on one another. They therefore cannot exist from their own side, irrespective of the existence of one another. Moreover, they also depend for their existence on us, because it is our cognitive act of cutting up the world of phenomena in the first place which creates the particular assembly of objects that constitutes a causal field, which then in turn gives rise to the notions of cause and effect. This entails that the causal field, cause and effect are empty of svabhāva.

It is evident that unlike the Ābhidharmikas, Nāgārjuna regards an object's not being empty—that is, its having svabhāva—as incompatible with the causal production of that object. A causally produced object depends on its cause for its existence and could therefore not stand outside of any dependence relation with other objects. Furthermore, if an object either existed or failed to exist by svabhāva, it would always do so, since such substantial properties cannot change. But then an existent object cannot be caused, since it will always have existed, a nonexistent object cannot be caused either, because it will never become existent. Therefore, in the presence of svabhāva (and thus the absence of emptiness) there can be neither causation nor change. It is equally clear that an object cannot depend notionally on some other object for having some property and yet have this property by svabhāva, for this property is then obviously had by the object not from its own side but only via its relation to some other.
object. Neither the existential nor the notional interdependence of cause and effect is thus compatible with ascribing svabhāva to them.

It also has to be noted that Nāgārjuna asserts, somewhat puzzlingly, that the absence of svabhāva, that is, emptiness, is not compatible with causation either.\footnote{MMK 20:18, 21b.} Causation in this context has to be understood as an objectively obtaining relation which links objects and events independent of human conceptualizations. Since the objects our theory relates do not exist “from their own side,” the same has to hold for any relation of causation linking them. If the objects in our everyday world owe their existence to a partly habitual, partly deliberate process of cutting up the complex flow of phenomena into cognitively manageable bits, the causal relations linking them cannot exist independently of us, since their relata do not do so either.\footnote{Candrakīrti’s commentary on 20:18 in the PP which makes this point is peculiar. In explaining Nāgārjuna’s assertion that empty objects cannot arise or cease (“How can the empty arise, how can the empty be removed? It follows that the empty is not ceased and not arisen.” katham utpatyate śūnyam katham. śūnyam. niroṣyate/śūnyam apl antiruddham. tad anutpannam, prasayyate), he refers to the example of space (ākāśa), according to Abhidharma metaphysics an unconditioned phenomenon which neither arises nor ceases (Dhammajoti 2004: 383–384). But this assertion ignores the fact that Nāgārjuna here (as in the preceding verse) attempts to make a universal statement. Since it is obviously not assumed that all empty phenomena are like space in lacking arising and ceasing, this reading of the verse appears to be rather misleading.}

5.3. The Four Ways of Causal Production

Having investigated what Nāgārjuna means by his claim that cause and effect are interdependent, we can now discuss his analysis of the different manners in which causal production could come about. Applying the four alternatives of the catuskoti or tetralemma to the relation of causation, Nāgārjuna distinguishes four ways in which a thing could be causally produced:\footnote{MMK 1:1; 12:1.}

- it could be caused by itself.
- it could be caused by something else.
- it could be caused by both.
- it could be caused by nothing at all.

5.3.1. Self-causation

The Buddhist discussion of self-causation subsumes two very different views of causal production which have to be separated clearly. The first is the view that

cause and effect are the very same object, so that at least in some cases the causal relation can relate an object to itself. The second does not assert that cause and effect are identical but claims that the effect is contained in, and forms part of, the cause. In the context of this discussion, this should be taken to mean that the effect is already contained in the causal field.

IDENTITY OF CAUSE AND EFFECT. It is evident that most instances of causation we encounter in everyday life are not cases of self-causation in the first sense. The spark that causes the explosion is not identical with the explosion. The causal field (the seed together with water, light, warmth, etc.) is what is supposed to bring about the effect (the tree), but it is not yet the effect itself—the collection of the seed, water, light, and so on is not the same thing as a tree but something on which the existence of the tree depends.\footnote{Being perdurantists and assuming that an object is wholly present during each moment of its existence seems to be a more satisfactory option. Here the object is not split up into temporal stages, and being a cause turns out to be part of the svabhāva of every perduration object. As long as the object exists, it must be its own cause; moreover, its causal role is independent of any cognizing subject. We do not have to conceive of an object as its own cause for it to continue to exist as its own cause.}

If we talk about one billiard ball colliding with another billiard ball which it thereby causes to move, we talk about two balls, not just one.\footnote{Nāgārjuna’s rejection of causation as a reflexive relation does therefore not appear to be particularly controversial. We might think, however, that self-causation is what explains the persistence of objects through time. “What causes the existence of the present billiard ball? Its existence at the preceding moment. Therefore the billiard ball is the cause of its own persistence.” But this reasoning would be mistaken. If we assume that the billiard ball has temporal parts (that is, if we are endurantists), the present temporal part of the billiard ball being caused by a past temporal part is not an instance of self-causation but rather an instance of one part of an object causing another, distinct part.}

The problem with this view is that it conflicts with our deeply ingrained assumption that the cause temporally precedes the effect. No object, however, can temporally precede itself.

A more successful example to which the notion of self-causation could be applied would be that of a creator god. Since most theists would not want

The problem with this view is that it conflicts with our deeply ingrained assumption that the cause temporally precedes the effect. No object, however, can temporally precede itself.

A more successful example to which the notion of self-causation could be applied would be that of a creator god. Since most theists would not want
to hold that the existence of such a god is contingent on something else, they might want to argue that the creator god exists as causa sui, thereby only causally depending on himself.22 Such a theist would obviously not be very impressed by Buddhāpālita’s argument against self-causation, which Candrākīrti mentions in his commentary on MMK 1:1, namely that a self-caused entity would continue causing itself and would therefore be eternal.23 Eternal existence is one of the welcome consequences of regarding the creator god as his own cause. A more substantial difficulty with the notion of self-causation appears to lie in the justification of using the term “causation” at all. An object that causes itself cannot exist in time, at least if we assume that a cause must temporally precede its effect. Given that temporal priority is an irreflexive relation, a potential self-causer could not be a temporal object.24 This notion is not problematic if the god is taken to exist outside time. But then it is not clear why such a non-temporal object would have to produce itself all over again, given that it already fully exists when it exists as a cause. Since such a renewed production cannot be required for its continued existence in the next moment in time, its production would be both without meaning (arthā) and without purpose (prayōja).25 If the causal relation has any essential properties, its role as a transmitter of change is surely one of them. Causation relates a state of affairs which is a cause, that is, a state of affairs in which the effect is not yet present to one in which it is present, and which has thereby changed.26 But a self-caused object could not change. Since its entire cause lies within the very object that is both cause and effect, there is no room for variation: such an object remains eternally the same. It thus appears that when the theist speaks of self-causation, he chooses a rather misleading way of talking about an object he considers to be atemporal, acausal, and changeless. Of course Nāgārjuna and

22. This idea goes back at least to Plotinus (Hadot 1971; Narbonne 1993). Everything that exists as causa sui obviously has its causal power as part of its svabhāva. Another way of dealing with this issue consists in asserting the creator god’s asety, i.e., his causal independence of everything, including himself.

23. “If the existent were to be born, it would never not be born.” atha sannāpi jāyeta na kadā cinā jāyeta PP 14:2–3. See MMK 10:1–4.

25. “Things are not produced from themselves because of the pointlessness of that production. . . . There is no purpose in the repeated production of existent things from themselves.” na svata upadāyante bhāvāḥ, tadutpādāvyāryāhāt . . . na hi svātmānānāvīdyaṃnānām. padārthānām, punarupāde prayojanam asti, PP 14:1–2. See also MA 6:8cd.

26. Nāgārjuna relies on this fact in his argument against suffering being self-caused (MMK 12:4, 8). If some person created his own suffering, then the effect (the person with suffering) was preceded by a cause which is different from the effect (the person without suffering), so that the transition from cause to effect could bring about the necessary change. But given the Buddhist identification of the notion of a person (padgala), its constituents (skandha), and suffering (duḥ, kha) (see Schayer [1931: 12–19]), such a person could not exist; the self-causation of suffering is thereby ruled out. See also Garfield (1995: 203–204).
the constitution of that object. If the mereological constituents of objects exist from their own side and causes and effects are special kinds of mereological constituents, causes and effects will also exist from their own side.

The historical precedent of the view of causation in terms of part and whole is the satkāryavāda theory of causation defended by the Sāṃkhya. This account is somewhat more sophisticated than the postulation of the mereological containment of the effect in the cause. The Sāṃkhya theory assumes that the effect (kārya) is already existent (sat) within the cause, although only in a yet unmanifested form. Everything we need for the production of a pot is already there in the causal field containing the lump of clay, the potter, and so on. Bringing about a cause is a transformation of the causal field, an unleashing of the previously hidden.

For the Sāṃkhya theorists the world is nothing but a sequence of transformations of primordial matter (prakṛti). In a similar manner we might want to conceive of the universe as an arrangement of atomic particles, and of each future stage of the universe as a rearrangement of these particles in some new way. On this conception causation would indeed never bring anything new into the universe, since all the combinatorial resources for the causal production of future stages are already there. All changes concern the way the individual particles are related to one another, but not what kinds of particles there are.

The Sāṃkhya doctrine has the advantage of being able to account for the fact that specific causes are related to specific effects. Curd can be made from milk but not from oil, because only the milk-particles, not the oil-particles, allow account for the fact that specific causes are related to specific sequence of transformations of primordial matter (prakṛti). In a similar manner we might want to conceive of the universe as a rearrangement of atomic particles, and of each future stage of the universe as a rearrangement of these particles in some new way. On this conception causation would indeed never bring anything new into the universe, since all the combinatorial resources for the causal production of future stages are already there. All changes concern the way the individual particles are related to one another, but not what kinds of particles there are.

31. Frauwallner (1973: I:303–306); Sharma (1960: 151–152). Parallels have been drawn between the satkāryavāda theory and the Sarvāstivādin assumption that not only present, but also past and future phenomena exist. The idea of a future effect being already real though not yet present is very close to the notion of an effect existing in a latent but unmanifested form in the cause. See Scherbatsky (1962: I:111); Kalupahana (1975: 150–152); von Rospatt (1995: 39, n. 72). Samghabhadrā in the *Abhidharmarāṇaśāstra, Taisha 1562, 635a*, argues against this identification. See Dharmajoti (2004: 100), Murti (1955: 172) and Siderits (2004: 404) subsume the Sarvāstivādin position under asatkāryavāda theories of causation.

We can identify two main arguments put forward by Nāgārjuna to refute causation from other objects. The first claims that causation from other objects entails an infinite regress.\(^\text{39}\) There are different ways in which we could spell out the argument Nāgārjuna has in mind here. Assume that some object \(x\) was caused by some distinct object \(x-1\). Now the cause of \(x-1\), which we will call \(x-2\) cannot be the same as \(x-1\), for then \(x-1\) would be self-caused, an alternative which has already been refuted. But it can also not be identical to \(x\), since the result would be a causal loop, where first \(x\) causes \(x-1\), which then in turn causes \(x\). Apart from the fact that this theory leads to problems with the temporal ordering of causation (if the cause must precede the effect, \(x\) will precede itself) causal loops also entail self-causation, even though an object will here cause itself not directly but only via an intermediate chain of other objects.\(^\text{40}\) It therefore follows that \(x\), \(x-1\), and \(x-2\) are three distinct objects. Given that the choice of these three was arbitrary, causation by another object thus entails the existence of infinitely many objects. Ganeri\(^\text{41}\) argues that this result is sufficient to rule out causation from another thing because “it cannot [. . .] be a matter of logical necessity that the world of objects is infinite.”\(^\text{42}\) Furthermore such a view of causation creates problems for the notion of causal explanation because “one never reaches the explanans.”\(^\text{43}\)

The problem with this interpretation is that while we would agree that, say, a logicist like Russell found it difficult to establish the existence of infinitely many objects as a truth of logic,\(^\text{44}\) it does not seem at all problematic that our concept of causation might logically entail the world as infinite (whether the world is in fact infinite is of course a distinct question). In particular I do not see why this should be a problem for Nāgārjuna, since I am not aware of any claim of his to the effect that the infinity of the world cannot be established by conceptual analysis alone, or indeed that the world is finite. Nor does it seem much more plausible to assume that a chain of causes stretching infinitely far

\[\text{39. MMK 7.19. A third, distinct argument is given in verses 5–8 of chapter 12, dealing with the existence of suffering. Nāgārjuna examines the possibility that the suffering of a human being is caused by another, namely by an earlier stage of that person, for example by that person in an earlier life. Since on the Buddhist conception, suffering (duḥ. kha) and the person experiencing the suffering (pudgala) are taken to be necessarily coextensive, this move does not help a lot. After all, the earlier stage of a person must have been experiencing suffering too, so that we now have to explain where this suffering came from, and so forth. But it is evident that this argument does not generalize to show the non-existence of causation from other objects tout court, since the cause does not always share the property it is supposed to bring about, as in the case of the various stages of the person: the firewood, which is the cause of the fire, is not already blazing.}\]

\[\text{40. For an argument that causal loops are logically possible see Lewis (1986a: 75).}\]

\[\text{42. Ganeri (2001: 52).}\]

\[\text{43. Ganeri (2001: 55).}\]

\[\text{44. Potter (2000: 151–152).}\]

backward vitiates the concept of causal explanation. After all, this means only that for every causal explanation, we can come up with another one to explain the fact referred to in the explanation in turn. But this is a property of explanations more generally: we can always demand (and in most cases also provide) an explanation of an explanation given. In fact it is hard to come up with an example of an explanation where the explanans itself is unexplainable. Even if there are some, explanantia in general are not like this.

In fact the only piece of textual evidence we have in connection with this refutation of causation from another does not claim that there is any problem with a world of infinitely many objects, but speaks specifically of the infinite regress produced by the assumption that objects are caused by objects distinct from them.\(^\text{45}\) It is therefore more satisfactory to understand Nāgārjuna here as addressing a criticism of the following form: “Of course it is not possible to assume both that an object has svabhāva, that is, exists independently, and that it is causally produced, because of its dependence on the cause that brings it about. However, we can circumvent this difficulty by incorporating the causes of an object into our conception of the object. Instead of speaking of the object that is a sprout, we refer to the whole causal complex of which the sprout is the final result: the seed together with water, moisture, and so on. It is such causal complexes (rather than individual objects) to which we want to ascribe independent existence.”

As Nāgārjuna points out, this procedure is viable only if you can justify drawing the line at the inclusion of the sprout, water, moisture, and so on, but without including anything else in the complex. Doing so would be possible if the things included were indeed self-caused, an argument that is unfortunately not available to us.\(^\text{46}\) Thus enlarging the conception of an object by including its distinct causes will always allow us to include more things, obliterating the distinction between objects altogether and thereby defeating the point of the exercise, for in order to arrive at a plausible candidate for the ascription of svabhāva we have to identify some things that could act as starting points of the chain of causes. But these things would have to be either their own causes or have

\[\text{45. anya upādayatena yady upādo navasthitih. MMK 7:19.}\]

\[\text{46. This point is stressed in MMK 12:7–8: ‘If we cannot show that it has been caused by itself, how could suffering have been created by another? If another one made the suffering, this one would have to have caused his own suffering. Suffering is not self-caused insofar as nothing is self-caused. If the other is not self-caused, how can suffering be caused by another? ‘svayamkṛtasāyāprāsaiddhā duḥ. kham. paraṅkṛtaṅkutah. / paraḥ hi duḥ. kham. yat kuryāt tat tasya sāyā svayamkṛtam. / na tāvat svakṛtam. duḥ. kham. na hi tenaiva tāt kṛtam. / paraḥ nātmakṛtaḥ cet sāyā duḥ. kham. paraṅkṛtaṅkutah. . The point made here is that we can speak of causal complexes as independent existents only if we stop going back in the chain of causes at some point. The only systematic reason for stopping at a particular cause would be the fact that tracing down its cause would bring us back to the object itself, i.e. the object was self-caused. But the possibility of self-causation has already been ruled out earlier.}\]
arisen without a cause. Each of these possibilities is rejected by Nāgārjuna, as our discussion in sections 5.3.1 and 5.3.4 shows.\(^47\)

The second Madhyamaka argument against the distinctness of cause and effect is not based on any difficulties with an infinite series but tries to show that if cause and effect were different objects, the complete absence of causation would be entailed, so that we could not draw any distinction between those objects that are causally related and those that are not.\(^48\)

This argument might strike us as a particularly strange one. What is wrong with assuming that the spark causes the explosion, though the spark is not the explosion, nor the explosion the spark? The important point to realize is that two distinct objects that are causally related could not exist independently, each having its own svabhāva. This is due to the fact that one will existentially depend on the other, which is its cause, while the other will depend at least notionally on the one, because that dependence is what makes it possible to describe it as a cause. When the Madhyamika speaks of causation by distinct objects, it is this kind of distinctness he has in mind: cause and effect are supposed to exist independently, it is not sufficient to assume that they merely differ by having some different properties. But if we have a collection of objects such that each exists independently of the other, it is very hard to see how we could make a principled distinction between those objects in the collection that are causes and those that are effects. Any division of the collection into causes and effects seems to be as justifiable as any other, so there is no distinction between the relation of causation and any other arbitrarily chosen relation defined on the set. Moreover, if we observe a collection of objects that all exist independently of one another over a period of time, we realize that nothing happens in this collection at all. The different objects will just sit there, without influencing or changing each other. If we conceive of causation as bringing something about which was not there at an earlier moment, no causation will be found in such a world.\(^49\)

It is important to realize that this argument is not based on any assumption claiming that “the effect must resemble or preexist in its cause,” so that two distinct objects (which ex hypothesi did not resemble one another in such a way) could not be causally related.\(^50\) As we have already seen, the idea of the preexistence of the effect in the cause is explicitly denied by Nāgārjuna.\(^51\) The point is rather that independently existent objects (whether resembling one another or not) could not be the relata of a causal relation. Given that one exists whether or not the other exists, how could one be the cause bringing the other one about as an effect? If, however, we still want to talk about such objects in causal terms, we have to ask ourselves what the point of this is supposed to be. After all, there is no more justification for claiming that one object is the cause and the other the effect, rather than the other way around, or that the members of some specific pair of objects, rather than those of another one, stand in the relation of cause and effect. Such a statement, however, would mean only that whatever relation we are talking about here is not the causal relation, since the causal relation is not subject to this kind of arbitrariness.

Assuming causation from another is a straightforward way of arguing for cause and effect existing by svabhāva. Because they exist independently, they do not require one another. But trying to establish causal relations (which are dependence relations) between such independent objects then leads to all sorts of problems. First of all, to escape the obvious contradiction of an independent (causally) dependent object, we can try to revise our conception of “object,” including everything an object causally depends on in this new conception of object and regarding this collection as the bearer of svabhāva. As we have seen, this new conception implies the difficulty that the things included bring with them what they causally depend on, which in turn bring other objects along and so forth. There is no mind-independent criterion for deciding where to draw the line between which objects to include and which to leave out. Second, a set of independently existent objects does not give us any indication of how the causal relations between them should be established. Since the

\(^{47}\) It should be noted that some of the modern commentarial literature also ascribes a different argument from an infinite regress to Nāgārjuna’s attempts of refuting causation by other objects. Garfield (1995: 113–114); Siderits (2004: 406). The defender of causation by other objects must explain why only particular pairs of objects, but not others, are related to one another as causes and effects. The obvious answer in this case it to say that only some but not all objects are linked by the causal relation. Now the obtaining of the causal relation itself either does or does not rely on conditions in turn. If it does not, it is unclear how much explanatory gain results from the postulation of a causal relation. If all we can say to explain that yoghurt comes from milk but not from oil is that milk and yoghurt stand in a particular primitive relation, it seems as if we have not explained much. After all, what we want to know is why certain pairs of things but not others stand in this relation. If, on the other hand, the obtaining of the causal relation in turn depends on conditions, we now have to explain what links the relation and its relata. And for whatever provides that linkage we can ask what links it in turn to the things it links and so on, following the familiar Bradleyan regress. Of course we can just reply to this question that a relation no more needs another relation to link it to its relata than glue needs superglue to make the glue stick to the things it is supposed to glue—the glue sticks all by itself, and relations are self-linking in the same way. (This is in fact the Natyāyikā reply to Bradley’s problem. See Siderits (2004: 417, n. 27)). There thus do not appear to be great problems for the defender of causation by other objects to seize the second horn of the dilemma, so the “infinite regress” argument fails on this particular interpretation.

\(^{48}\) prabhakto phalabhotah. svāt tulyo hetter ahetunā. MMK 20:20. See also 10:1a.

\(^{49}\) “[Fuel] which is different [ from fire] is not reached; unreached it does not burn; moreover, not burning it will not be blown out. Not blown out it will continue to blaze, like something having a property essentially.” anyo na prāpsyate ‘prāpto na dhakṣyaty adahun punah. / na nirvāṣayyati anirvāṇah. sthāṣyate vā svalin’ gāvan. existence of any object does not influence the existence of any other object, it appears to be completely arbitrary which way around we consider the causal relations between the objects to hold. For these reasons the assumption of distinct, independently existent objects does not support the view that cause and effect exist with their own svabhāva.

5.3.3. Causation by Itself and Another Object

The third alternative to consider is that an object is caused both by itself and by other objects. This possibility is usually dismissed very briefly in the Madhyamaka literature with the claim that since self-causation and causation by other objects have already been refuted individually, there is no need to refute both of them together.\(^{52}\) To illustrate this point, Candrakīrti gives the rather unfortunate example of two conditions, neither of which is fatal, arguing that this demonstrates that both together could not be fatal either.\(^{53}\) That this implication does not hold can be seen from the example of binary poisons which consist of two chemicals that are non-toxic individually but poisonous when combined. I do not think that Nāgārjuna here argues by relying on the (faulty)\(^{54}\) principle that if neither of two entities has a property, both of them put together will not have the property either. What he wants to show in this context is that if we have disproved each of a set of two propositions, we do not need a further argument to disprove their conjunction, since this is entailed by the individual refutations.\(^{55}\) It should be noted, however, that it is possible to interpret the third possibility in such a way that the simple refutation of self-causation and of causation by another object will not be sufficient. This is the case if we take the third possibility to be the position that the cause already contains the effect as a potentiality which is brought out only in the presence of particular supporting circumstances.\(^{56}\) In this way the effect, such as an explosion, is neither wholly caused by objects different from it (since it was already present as a potentiality in the spark that caused it) nor just produced from itself as the potentiality present in the cause (because without the auxiliary conditions, such as the

52. MMK 12:9a states the contraposition: “If suffering was caused by both [itself and others] it could be caused by each individually,” syād udbhābhāyāṁkritam. dhah. khamsyād evaikakṛṣṇam. yadi.

53. “It is not the case that who is not killed by each individually is killed by both [together].” na caikaikena prāṇ. ātipāte ’kṛte dvābhāyāṁkṛṣṇa. PP 233:6.

54. As even limited exposure to mixing paint or cooking demonstrates.

56. This view of causation has been ascribed to the Jains (Perrett [1989: 2:267–257]; Ronkin [2005: 197–198]). It coheres well with their multiperspectivalist outlook (anekāntavāda) to argue that the effect is already present in the cause qua its potentiality (śakti) but not qua its fully developed form. temperature required or the presence of oxygen, the explosion would not have happened). Therefore\(^ {57}\)

the happy compromise doctrine that emerges is the doctrine of causation-by-both: Effects are the result of the joint operation of the effect itself in potentia and the external conditions necessary to raise the effect’s mode of existence from potentiality to actuality.

It is apparent that on this understanding of the third possibility, it is not enough just to point at the refutations of the first and second possibilities, for in this scenario there is neither a perpetually self-reproducing object due to the necessity of auxiliary conditions, nor do we have to suppose that there is a causal relation holding between existentially independent objects, given that cause and effect are connected by the latter’s being present as a potentiality in the former. It seems as if the “happy compromise” manages to avoid the difficulties Nāgārjuna attributes to both self-causation and causation from other objects. A slightly different compromise solution which gets by without the potential existence of the effect in the cause can be found in the theories of the Naiyāyikas and Vaiśeṣikas.\(^ {58}\) According to them, causation is understood to proceed by means of two internal causes and one external cause. The two internal causes are the inherent cause (samavāyīkāraṇa) and the non-inherent cause (asamavāyīkāraṇa), and the external one is the instrumental cause (nimittakāraṇa). If we consider the way a marble statue is produced we can identify at least three different components: the marble out of which the statue is made, the various properties of the marble (such as color, hardness, density, etc.), and the actions of the sculptor. The marble constitutes the inherent cause, the material basis out of which the effect is made; it can be compared to the Aristotelian causa materialis. The non-inherent causes (the marble’s properties) do not cause the statue, but rather cause properties of the statue. Unlike the inherent cause, changes in the non-inherent cause do not change the kind of effect produced. Whether the marble is white or red, we still end up with a marble statue. Had the marble been clay, however, we would not have done so. These two internal causes are then combined with the instrumental cause (comparable to the causa efficiens) to bring forth the effect. The sculptor clipping off pieces from the block frees the statue locked within. On this account the marble statue is obviously not completely self-produced: the block of marble and its properties will just continue to sit there until the sculptor comes along. On the other hand it is not

produced from objects that are completely different either, since any part of the statue is also part of the block of marble which is its cause.

The reason this account of causation is not particularly attractive for Nāgārjuna’s opponent is that the ascription of being an inherent, non-inherent, or instrumental cause as a property something has by virtue of its svabhāva is hardly satisfactory. Nothing can be a causa materialis in itself; it depends on the existence of a causa efficiens to turn it into an effect. The causa efficiens (the sculptor working on the marble) could not exist without the inherent or material cause (the block of marble). The non-inherent cause (the properties of the marble) needs the inherent cause as something to inhere in.

It is apparent that the three kinds of cause distinguished here both notionally and existentially depend on one another, as well as on the effect they jointly bring about. Their various causal properties are therefore nothing the respective objects have from their own side, independently of other objects. For this reason this account of causation is unable to defend the claim that the causality of the cause and the effect-ness of the effect are properties that cause and effect have in virtue of their svabhāva.

5.3.4. Absence of Causation

The final possibility to discuss is causation that is neither self-causation nor causation by another object. This is generally regarded as the absence of causation altogether, given that the first three possibilities are taken to exhaust the ways in which the relata of causation can be related. If these are ruled out, the only remaining option is that objects do not exist as causal relata since there is no causal relation. We might think that there are some entities that may plausibly be taken to exist outside the causal nexus, such as mathematical objects and other abstract entities. Nāgārjuna does not talk about the metaphysical status of mathematical entities, so any account of what he would have said about these is

59. MMK 12:9b.

60. It is not quite clear who the original proponents of this view of fortuitous origination (adhiḥcasamānupāda, see Ronkin [2005: 198]) actually were. Murti (1955: 135, n. 3, 167) identifies it as the view of the svabhāvavādin, which is usually identified with that of the Āryacakas; see also Kalupahana (1975: 25). Namai (1996: 561) agrees and mentions svabhāvavāda, that is, the view that “phenomena are spontaneously diverse, there being no intervention of destiny or divine will” (Tillemans [2000: 38, n. 210]) as one of the positions held by the Āryacakas. Schayer, on the other hand, denies the ascription of this view, since the Āryacakas, he argues, denied causality only in the context of karma but did not deny all causal determinations, as they specifically assert that things are determined by their intrinsic nature (svabhāva) (1931: n. 16, 20–21). Given the limited amount of information about the Āryacaka system we presently possess, whether their view of causation should be regarded as one implying the complete absence of causation, causation by another object (as claimed on page 164), or even selfcausation remains a moot point.

by necessity highly speculative. Moreover, he is interested in analyzing general accounts of how causation works. Since we would hardly want to describe all phenomena as abstract, there still remains the question of how to understand the working of causality for phenomena unlike numbers and so forth.

Two distinct problems with the absence of causation are distinguished in the commentarial literature. First of all it is not clear how any facts about the world could be grasped (gr. hyate), given that our main route of epistemic access to the world is causal. Assuming that we are not causally connected to phenomena in the everyday world would make their epistemology as problematic as those of objects outside of the causal nexus.

Second, and more important, a world without causation would be phenomenologically very much unlike the world we experience. That we experience the world as regular largely means that we experience it as causally ordered. Certain effects proceed from certain causes but not from others: blood will flow if we strike a man, not if we strike a stone. A world with no causation is a world in which more, or less, anything can follow anything else. Without our claiming that the assumption of the absence of causation “falls to the ground through sheer inanity,” it is sufficient to note that such a world is not the world we experience, and therefore the fourth alternative is no satisfactory explication of our concept of causality.

5.3.5. Identity, Difference, and Svabhāva

If we imagine a set of points on a plane connected to one another by lines, we can imagine various connective possibilities for a particular point. It can be connected to itself via a looping line, or to another point, or both to another

61. One might want to argue that Nāgārjuna’s assertions that there is no effect without a cause (na cāṣṭy arthah. kaścid āhetukah. kvacit. MMK 4:2) and nothing that is not dependently originated (apratītyasamutpanno dharmah. kaścin na vidiyate. 24:19) rule out the existence of abstract objects altogether. Nevertheless one might read the first statement as saying that something not causally produced could not be referred to as an effect and remark concerning the second that dependent origination does not just mean causal origination. The existence of some mathematical structure might, for example, be logically entailed by certain concepts we have and therefore be dependent on these concepts for its existence. This possibility, however, does not mean that it is causally produced.

63. “If the world was empty of a cause, it could not be grasped, like the hue and scent of an [imaginany] lotus in the sky,” gr. hyate nāi ca jagad yadi hetuśūnyaṃsyād yadvad eva gaganotpalavarnagandhau. PP 38:7–8. This is a quotation from MA 6:100.

64. As was pointed out by Buddhāpālītī as quoted in PP 38:10–11: “It is not the case that things arise without cause because of the difficulty of everything arising always and everywhere,” abyone nhāti ca bhāvābhāva. sadā ca sarvatā ca sarvasam. bhavaprasan’ gāt. For the Tibetan, see Walleser (1913–1914: 11–12). The same point is made in MA 6:99.

point and itself, or not connected to any point at all, or it can be connected not to itself but to a proper part of itself. The conclusion Nāgārjuna wants to draw from the preceding arguments is that if we apply this conceptual structure to causation, by letting the points stand for objects or events, and the lines for the causal relation, none of the possibilities could obtain. Given that the set of connective possibilities is exhaustive, the reason must lie in the fact that we make a basic assumption about points connected by lines which is not justified when we speak about events connected by causal relations.

This assumption is that the points exist with svabhāva, that is that they are distinct objects existing from their own side, independently of one another as well as of the cognizing subject which attempts to connect them by lines. Nāgārjuna argues, however, that cause and effect do not exist in this way. They are both notionally as well as existentially dependent on each other, as well as dependent on us as a cognitive subject that orders a chaotic mass of diverse experiences into causal fields and the effects they bring about. If cause and effect were identical, it could obviously not be the case that the effect was dependent on the cause for its existence at a later time. Their mutual dependence would also not be compatible with cause and effect being two distinct objects in the same way as two points are distinct objects, where none brings the other into existence, nor would such dependence allow that an effect depended causally both on itself as well as on other objects. If the effect was part of the cause, the existential dependence of the effect on the cause at a later time would also not be possible. Finally, if no lines connected the points, the points would still be points, but cause and effect could not exist in the absence of causal relations.

The conclusion of Nāgārjuna’s examination of cause and effect in terms of identity, difference, and parthood is therefore that such a conceptualization fails because it makes presuppositions about the existence of the objects thus related (about their notional and existential independence and existence with svabhāva) which are not applicable to cause and effect. Cause and effect have to be conceived of as both mutually dependent, as well as dependent on the cognizing subject, and therefore as empty of svabhāva.

5.4. Temporal Relations between Cause and Effect

Causes and effects are events that occur against the background of a particular causal field. One metal sphere moving (the causal event) brings about the mov-

67. 'bras yod 'bras dang ldan pa'i rgyu / de med na ni rgyu min mtshungs. As is evident from the interpolations in my translation, the interpretation of this verse is not entirely clear, to say the least. This unclarity is further exacerbated by the existence of a number of variant readings. For some different translations, see Tola and Dragonetti (1987: 25); Komito (1987: 107–108), Erb (1997: 75).

68. MMK 20:12–14.
the switch) begins, endures, and then stops. After this the effect (the light going on) begins. Unless we postulate another event which stretches right up to the time when the light goes on (thus raising the whole question of temporal relations anew, this time for the effect and this event), the cause will have stopped to exist before the effect begins.

Nāgārjuna considers it to be problematic that something that has already ceased could be regarded as a causal condition. This problem arises specifically for the Abhidharma view of phenomena as minimally extended spacetime points. Within this theory of moments (ksanavādī) it is difficult to see how the existence of a phenomenon limited to an atomic temporal point could be compatible with its causal efficacy, as when the cause exists, the effect is still inexistent, and when the effect arises, the cause will already have ceased to be. It thus appears that being brought about by a cause that is past is no better than having no cause at all.

The difficulty Nāgārjuna raises with his criticism is the problem faced by presentist theories of time when they attempt to account for the causal relation. For the presentist only the present, but not the past or the future, qualifies as real. He therefore faces a problem when trying to explain that the present is the way it is because of causal influences from the past, since he will have to postulate that of the two relata of the causal relation only one (namely the present) is part of reality.

Among the Abhidharma this presentist difficulty is faced by the Theravāda account, according to which only the present moment, consisting of the origination, endurance, and dissolution of a phenomenon, exists and has svabhāva, while past and future moments are devoid of svabhāva. This theory will then have to explain how something that is past and therefore non-existent can nevertheless assert its causal influence on the present.

It should be noted, however, that this problem does not arise for the Sarvāstivādins, whose metaphysical theories generally constitute the main target of Nāgārjuna’s philosophical criticism. For the Sarvāstivādins, past, present, and future all exist, they all have svabhāva. Such a theory obviously needs some way of accounting for the privileged status of the present. Different Sarvāstivāda thinkers have proposed different ways of doing this. The most popular account, due to Vasumitra, argues that the special nature of the present is due to the fact that only present phenomena manifest causal activity (kārita). A phenomenon is past if it has already discharged its activity, it is future if it has yet to discharge it. Despite being devoid of causal activity, a past phenomenon nevertheless continues to exist and remains able to cause presently existing phenomena.

The obvious way of avoiding this problem of a succession of cause and effect within a theory of the momentary existence of phenomena in which only the present is regarded as real is to assume that cause and effect are temporally contiguous. This conception of a contiguous cause (samanatara-prataya) was adopted by a variety of schools of the Abhidharma, by the Sarvāstivādins, and, by the Sautrāntikas and the Theravādins. According to this theory, whenever one phenomenon follows another one without a pause, the latter may be regarded as the cause of the former. In fact Nāgārjuna raises this problem specifically with regard to the notion of immediately preceding conditions (anantara), which is one of the four types of conditions distinguished by the Ābhidharmikas, discussed by him in the second verse of this chapter. Immediately preceding conditions are “the countless intermediary phenomena that emerge upon the analysis of a causal chain” and that happen between a particular causal event and its effect.

The main advantage of the theory of temporal contiguity of cause and effect is that it eliminates the existence of a temporal gap between the two, a gap during which the cause no longer exists because it has just ceased, and during which the effect does not yet exist because it is just about to begin. Such a gap would make it hard to explain how any causal efficacy can be passed on from cause to effect, since they are divided by the insulation of a causal vacuum, a gap in which no causation takes place. If the temporal moments of cause and

effect are regarded as “directly touching,” however, this difficulty is avoided, even if only the present moment is regarded as existent. The past moment does not have to exist in the present in order to be causally efficacious; all that is required is that it passes on its causal power when the moment of the cause and the directly successive moment of the effect meet. Whether this account is able to provide us with a satisfactory theory of causation, however, in turn depends on the conception of time on which the view of causal contiguity is based.

If we combine the notion of the contiguity of cause and effect with a view of time that does not view moments as atomic but as divisible in turn (as the Theravādins did), this approach does not seem to help us much in addressing the problem of the temporal relation between cause and effect, for in this case no matter how close we regard the last moment of the cause and the first moment of the effect to be in time, there will always be a moment between them which is different from either, thereby perpetuating the problem of the temporal gap.

If, like the Sarvāstivādins and Sautrāntikas, we regard time as discrete and composed of atomic, indivisible moments, however, the situation we consider looks like the one depicted in Figure 5.1. Here there is obviously no temporal gap between the end of the cause and the beginning of the effect, since there is no further moment of time between these two moments. Nevertheless it does not seem to be the case that this is really a view of the temporal relation between cause and effect that the opponent of Nāgārjuna would want to defend. Obviously, the causal event does not become a cause until the first moment of the effect is present, for if the effect had never existed, the cause would not have been a cause (and, if we adopt the Nāgārjunian line of the existential dependence of the cause on the effect, in this case the cause would not have existed at all). When the first moment of the effect is present, however, the cause is already past, so that during no moment when the causal event was present was it actually a cause—the term “cause” is applied to it only post festum. The cause, or more precisely the causal field, comes into existence as such (as opposed to a random collection of objects) only after the effect has been produced. Only after the sprout has been produced can I identify all the various elements that led to its production as its cause. But this theory then implies that being a cause cannot be an essential property of the underlying event, since the event can have the property at one time (after the effect has been produced) and lack it at another time (before the effect was produced). Such a conception will therefore not support the idea that the cause exists as a cause from its own side, and that being a cause is part of its svabhāva, a position which Nāgārjuna’s opponent will want to defend. For the Sarvāstivādin, a phenomenon’s causal efficacy, like its svabhāva, does not undergo any change through time; it is only the phenomenon’s activity (kārita) that becomes existent in the present moment and then ceases as the phenomenon vanishes into the past. But, as Nāgārjuna argues, we do not call anything a cause unless it actually produces an effect; its being a cause depends on something’s being the effect it produces. In the presence of such a dependence, however, being a cause cannot be part of the phenomenon’s svabhāva, since this very notion demands its being able to exist as a cause from its own side, independent of any other object.

5.4.2. Cause and Effect as Overlapping

Suppose there are two events related in the way depicted in Figure 5.2. The causal event (my pressing the light switch) begins at time $t_0$ and continues until $t_5$. The effect (the light going on) begins at $t_1$ (while the cause still continues) and goes on until $t_3$, after the cause has ceased. On the face of it this seems to be a reasonable understanding of the temporal relation of the cause and effect involved in this case. I press the switch ($t_0$), after some time the light goes on ($t_1$) and then goes off ($t_3$).
on \(t_1\), then I stop pressing \(t_2\); and the light continues to be on until some future time \(t_3\).

There are two main difficulties with this picture. The first and most general problem is that seeing cause and effect as overlapping—in contrast to all other accounts of their temporal relation—implies that cause and effect are temporally extended. But given that temporally extended things have temporal parts and that partitive things cannot be ultimately real, this view seems to defeat the point of the argument. Nāgārjuna’s opponent is interested in establishing causal relations between ultimate existents, that is, between objects that are (unlike temporally extended objects) not conceptually constructed. But conceiving of cause and effect as overlapping (whether we think that there is a clear cut-off line between cause and effect as indicated in Figure 5.2, or whether we take this process to be a gradual one) entails that we do just that, since we have to conceive of them as spread out across time.\(^87\)

The second problem is that according to the situation depicted in Figure 5.2, the cause would be taken to cease at \(t_2\), when the light switch-pressing event comes to an end. This, however, means that we have to regard the period between \(t_1\) (when the light went on) and \(t_2\) (when I stopped pressing) as part of the cause. But my pressing after the light went on was of no consequence for the effect in any way, so it appears to be rather strange that we take a causally inert part of the event to be part of the cause. Nāgārjuna argues that in this case what we take to be the cause would have a double nature (ātmadvaya): one, its causal power which is employed in bringing about the effect, and two, its causal inertness, after the causing has been done.\(^88\) While having two incompatible properties at different times is of course not a problem in itself (an apple can be green now and red later), assuming that part of the nature of a cause is causally inert seems distinctly odd—if a cause has any nature at all, it seems to consist in being able to bring about an effect. It is therefore undesirable for anyone who wants to argue that being a cause is part of some object’s svabhāva to assume that this object has a causally inert temporal part. If we now try to avoid this problem by “cutting off” the causally inert part of the cause ranging from \(t_1\) to \(t_2\) and only regard the event ranging from \(t_0\) to \(t_1\) as the cause we end up with a scenario in which cause and effect are temporally contiguous, the difficulties of which have been discussed above.

\(^88\) “If the cause ceased to exist after having passed on the causal power of [bringing about] the fruit, the cause would have a double nature: the given [causal power] and the ceased [nature after having passed on the causal power].” hetum phalasya dattvā ca yadi hetur nirudhyate / yad dattam. yan niruddham. ca hetor ātmadvayam. bhavet. MMK 20:5.

5.4.3 Cause and Effect as Simultaneous

The third possibility to discuss is that of cause and effect being simultaneous, that is, coming into existence and ceasing at the same moment. The concept of simultaneous causation (saḥabhāhētu) is of central importance in the Sārvastivāda theory of causality.\(^90\) The principal Sārvastivāda example of simultaneous causation is a thought (citta) and its specific concomitants (caitasika)\(^90\) which mutually depend on one another “like the poles of a tripod.”\(^90\) A thought cannot arise earlier than its concomitant factors, nor can such factors be earlier than the specific thought they accompany. The concept of simultaneous causation is essential for the Sārvastivāda theory of the existence of past and future as well as present objects. The main argument for this thesis of universal existence (sarvāstitva) is that since consciousness needs an existent object, and since there is consciousness of past and present phenomena, these phenomena must be existent objects. But of course this idea establishes the existence of past, present, and future objects only if the object of consciousness (the cause) and the consciousness of that object (the effect) exist simultaneously. If a past object was able to cause a consciousness of it that is present, the past objects could be non-existent, even though the present consciousness of such objects does exist.\(^92\)

Nāgārjuna is interested primarily in the possibility of cause and effect coming into existence at the same time.\(^93\) An immediate problem with this idea is that the cause is generally taken to be what brings the previously nonexistent effect about, and therefore something that exists while the effect does not yet exist. We distinguish the effect from the causal field by observing that the causal field (the wires, the bulb, pressing the switch) is there first, without the effect (the light going on), which appears subsequently.

A second difficulty is evident from a problem Nāgārjuna discusses in a slightly different context.\(^94\) Speaking of cause and effect as simultaneous, we intend this to mean that there are two distinct events beginning at the same time.

\(^89\) Dhammajoti (2004: 116–117) gives a selection of passages from the Sārvastivāda Abhidharma literature dealing with simultaneous causation. See also Tanaka (1985); Burton (1999: 193); Dhammajoti (2003); Ronkin (2005: 217). The idea of a saḥabhāhētu also becomes important in Yogācāra literature where the ālayavijñāna and bija are regarded as standing in a simultaneous causal relationship. Dhammajoti (2004: 121–123).
\(^90\) Dhammajoti (2004: 162).
\(^92\) Dhammajoti (2004: 38, 125).
\(^93\) MMK 20:7.
\(^94\) MMK 6:3–9.
time as one another rather than one event referred to by two different names.\(^95\) Their being distinct, we should be able to imagine one without the other; it should be logically possible that one of the two distinct entities exists while the other does not. At least this is the case according to the sense of distinctness in the mind of Nāgārjuna’s opponent, who will attempt to base the distinctness on the svabhāva of the respective events. Considering the interdependence of cause and effect discussed above, however, such distinctness does not obtain, so that a claim for simultaneity cannot be made.

The reader of Candrakīrti’s commentary on the above passages will notice that he attempts to elucidate Nāgārjuna’s assertion that cause and effect cannot exist together, observing that simultaneously existing objects such as the left and right hand,\(^96\) or the left and right horn of an ox,\(^97\) are never seen to stand in a causal relationship. This seems to be incorrect, as there are in fact a multitude of \textit{prima facie} examples where cause and effect come into being at the same time: the cause of the effect of the left-hand side of a pair of scales going up (namely its right-hand side going down) begins at the same moment in time as the effect,\(^98\) as does the cause of the cart’s moving (namely the motion of the horse). If we place a ball of lead on a soft cushion, the cause (putting down the ball) and the effect (the indentation in the cushion) equally arise at the same time.\(^99\) Nevertheless, we have to note that these are hardly the examples the critic of Nāgārjuna who wants to establish cause and effect as independent, self-sufficient entities could be looking for. The motion of the horse and the motion of the cart are simultaneous but clearly not distinct in the strong sense defined above: it is certainly physically (and presumably also logically) impossible for the cart to move forward while the horse stays where it is. This example is therefore not able to establish the simultaneity of two independently existing events.\(^100\)

\(^96\) PP 395: 9–10.
\(^97\) PP 139:14, see also 224:4.
\(^98\) This example is discussed in MA 6:18–19. See also Shaw (2002: 230); Siderits (2004: 408).
\(^99\) For the origin of the last example, see Kant (1993: A 203, B 248); some commentary is in Rosenberg (1998) and Le Poidevin (1988). See also Bugault (2001: 252).
\(^100\) A different interesting argument against the simultaneity of cause and effect, attempting to show that it would undermine the existence of any succession of causes, is given in Hume’s \textit{Treatise of Human Nature} (1896: I, III, II: 76). See also Munsat (1971). Suppose a cause and its effect existed at the same time, \(t\). Suppose further that there was another cause of the effect which existed at \(t\); a short instance of time before this. Given that the simultaneous cause produces the effect immediately but the earlier cause does so only after some delay (i.e., the time that passed between \(t\) and \(t\)), we would want to regard only the simultaneous cause as the true cause (the earlier cause is at best an earlier part of the effect’s causal history). Therefore, given the possibility of a simultaneous cause, no earlier event will be a plausible candidate for being a cause. Given that there are always events simultaneous with another event, we will always prefer to regard these as causes, rather than

5.4.4. Cause and Effect as One Event

A final possibility Nāgārjuna raises in MMK 20:20 is the suggestion that when speaking of causes and effects we are not dealing with two events at all but in fact with only one single event, which in the course of its history transforms itself from a causal event into an effect event. Now the question to consider is whether the cause retains its causal nature after the transformation. If it does not, it will not be the same any longer, since for Nāgārjuna’s opponent, being cause and effect are not just intrinsic features of events but also essential ones, that is, they are features an object cannot lose without ceasing to be that very object. As Candrakīrti points out, for the defender of the “transformation” theory the difference between cause and effect cannot be one just in terms of description (\textit{sam, jñāmātrabheda}), but must be one in terms of essence (\textit{dravyabheda}).\(^101\)

If the event retains its causal nature, however, then after the cause has ceased, an event with the very same svabhāva will arise once more. This situation is problematic for the same reasons that the presence of the effect in the causal field is problematic, as was discussed in MMK 20:1: if the cause already existed, there would be no need to produce it once more. A further problem arises from the fact that it is hard to see how this kind of self-causation should ever stop. Since there were no factors present apart from the causal event that triggered its transformation into the effect (which is the very same event as the cause and is both cause and effect essentially), there is no absence of factors that could stop such a transformation. The cause would be self-perpetuating and exist forever.

5.4.5. Temporal Relations and Svabhāva

In considering any two events, it is evident that either they appear in succession (being contiguous or separated by a temporal gap), or that they are temporally overlapping, or that they happen at the same time, or that they are successive stages of one single event. As we have seen, Nāgārjuna denies that any of these possible temporal relations holds of two events which are related to one another as cause and effect. The reason is the same as what we observed in the case of the relation between cause and effect in terms of identity, difference, and some preceding event. But if we thus assume that for any effect its cause is simultaneous, we are faced with the problem that simultaneity is transitive. If cause \(c\) is simultaneous with effect \(e_s\), and \(e_s\) is in turn simultaneous with whatever effect \(e\) may have (call this \(e_e\)), then \(c\) and \(e_e\) are also simultaneous. Therefore all causes and effects would happen at the same time, and thereby there would be no such thing as a causal succession in time.

\(^101\) PP 397:7.
parthood. The above set of temporal relations presents us with an exhaustive classification of all possibilities only if we are dealing with distinct and mutually independent events that exist from their own side independent of a cognizing subject, that is, with events that exist by their own svabhāva. Cause and effect, however, do not exist in such a way, since one brings about the other. Given this dependence relation, cause and effect cannot be separated by a temporal gap, because in such a case the effect would have to depend on a nonexistent object, since the cause does no longer exists. Assuming them to be overlapping entails that the cause has a causally active and a causally inert part, which conflicts with the assumption that being a cause is part of its own nature. If cause and effect come about at the same time, it is hard to see how the effect could rely existentially on the previously existing cause, while taking them to be stages of one event again means that the cause cannot be a cause as part of its own nature, since this is a property the cause loses when turning into the effect.

The consideration of the temporal relations between cause and effect therefore demonstrates once more the inapplicability of conceptual schemes suitable for discussing mutually independent and observer-independent objects to causes and effects. Being empty of svabhāva, they cannot be conceived of by use of the conceptual resources intended for discussing phenomena which exist both independently of one another and independently of a cognizing subject.

Having investigated a variety of commonsensical theories of the identity relations between cause and effect, as well as theories of their temporal relations, Nāgārjuna concludes that the commonsensical view of objects underlying these theories is unsatisfactory, since it conflicts with each of the ways in which the relation between cause and effect can possibly be conceived of.

According to the view Nāgārjuna wants to establish instead of the commonsensical one, cause and effect do not exist independently of one another: they require each other both notionally and existentially. There is no point in using the concept of a cause without that of an effect, or vice versa. More important, while an effect cannot exist without being brought about by a cause (or, more precisely, by a causal field), the effect brings about the causal field as well, because without the effect there would be no indication of which phenomena are to be included in some causal field and which are to be left out. The causal field is not something found ready-made out there in the world, waiting to be discovered by the inquiring mind. It is a cognitive artifact brought about whenever the mind organizes its experiences. To this extent the causal field does not depend just on the effect that provided the justification for certain objects rather than others to be included in it, but also on the mind that does the including. Cause and effect are therefore not just mutually interdependent, but also mind-dependent. This is what Nāgārjuna means by saying that causes and effects do not exist from their own side, that is, that they are empty of svabhāva.

A general worry we might want to raise about Nāgārjuna’s attempt to establish emptiness on the basis of causation is the following. It is clear that showing that some object causally depends on another one shows that it is empty in some way. For example, if we define an object to be non-empty if it is mereologically, causally, and conceptually independent, then demonstrating that some object is causally produced is obviously enough to show that it is empty. But this might not be good enough. After all, it is the notion of emptiness in terms of conceptual dependence or imputation which is generally regarded as the most subtle understanding of emptiness. But it is clear that establishing that some object is causally produced does not entail that this object is also conceptually constructed.

Siderits argues that this difficulty can be solved by attributing to the Mādhyamika the principle that if some object essentially involves a property that is conceptually constructed, the object is conceptually constructed too. If we replace “conceptually constructed” with “fictional,” the truth of the principle is immediately evident. Consider a violin performance by Sherlock Holmes as a simple example. This object essentially involves the relation “being performed by Sherlock Holmes,” which is a fictional property. For this reason the performance, which incorporates this property as an essential part, is fictional too.

In the same way, the Mādhyamika will argue, each material object essentially involves reference to causality, since all these objects are causally produced. But if it is now demonstrated, as Nāgārjuna set out to do, that the causal relation does not exist from its own side, is conceptually constructed, and thus is empty, it follows that each material object must be conceptually constructed and therefore empty in the most subtle sense as well. In this way the discussion of causality is not just able to establish the comparatively crude emptiness in terms of causal interdependence, but also the more subtle one in terms of conceptual construction.

5.5. Analysis of Time

The analysis of causation is intricately bound up with that of time as it refers to temporal relations at various crucial places in the argument. Nāgārjuna

102. It is useful to remember in this context that for the Ābhidharmikas, conditioned objects (samskṛta dharma) were regarded both as having svabhāva and as being dependently originated.

103. See Burton (1999: 115).

discussed time in the shortest chapter of the MMK, which consists just of six verses. He notes first of all that the past, present, and future existentially depend on one another.\(^\text{105}\) Not only could there be no present if there were no past or future, there could also be no present if it were not related to past and future in exactly the way it is, that is, sandwiched between them. Time is a fundamentally relational phenomenon with an intrinsic ordering. Assuming such an interdependence between the three times, Nāgārjuna claims that if the present and the future depended on the past, then the present and future would exist in the past.\(^\text{106}\) On the face of it this seems to be the now familiar point that when a dependence relation holds between two entities, both of them must exist. If, for example, we claim a pot to exist in dependence on its parts, both the pot and its part must exist. But on the (not implausible) ascription of a presentist view of time to Nāgārjuna, according to which only the present is real, neither the present nor the future can depend on the past since the past does not exist any more. We would thus have a case of a dependence relation with only one term, since one of the relata failed to exist.

We can identify a different problem here if we assume that dependence relations exist only between objects located in time,\(^\text{107}\) for then past, present, and future would have to be located in another time, which would in turn give rise to temporal relations located in a yet another time and so on. In the end we would need an infinitely extended hierarchy of times to make sense of the dependence between the three times. Given these difficulties of analyzing time in terms of dependently related phenomena, Nāgārjuna concludes that none of the three times can be found.\(^\text{108}\)

The difficulty with this reading, however, is that Nāgārjuna immediately goes on to assert that “by precisely the same method,” concepts such as highest, lowest, and middle should be elucidated.\(^\text{109}\) The problem is that, pace Garfield,\(^\text{110}\) the above argument cannot be generalized to cover spatial relations as well. The higher, middle, and lower part of a building can perfectly well be described as depending on one another. The second floor notionally (and architecturally) depends on the first floor, since it is only in relation to the first floor

\(^{105}\) “In turn the past is not found established independent of the two [present and future].” anapekṣyvā punah. siddhir nātiśam. vidyate taryoh. . MMK 19:3a.

\(^{106}\) pratyutpātano ’nāgaśca ca yady aśītam apekṣyā hi / pratyutpātano ’nāgaśca ca kāle ‘tīte bhavisyatāḥ. . MMK 19:1.

\(^{108}\) pratyutpātano ’nagataś ca tasmāt kālo na vidyate. MMK 19:3b. Verse 4 makes clear that this assertion is also meant to apply to the past.

that it can be called “second floor,” and it is also the first floor that keeps the second floor up. But since all these parts of a building exist simultaneously, all the relata of the dependence relation do. Therefore neither the argument from the non-existent relatum nor indeed the regress argument\(^\text{111}\) get off the ground in the spatial case.

We could assume that what Nāgārjuna means here is just the general fact that distinctions such as high, middle, and low are essentially relational,\(^\text{112}\) so no object could for example be regarded as essentially “middle” since this property depended on its spatial relation to objects other than itself. But this concept seems at odds with Nāgārjuna’s earlier attempt to find fault with the very idea of establishing the three times as dependent entities.

Alternatively we could understand the argument as claiming that if any present or future entity depended on a past entity, this entity would have to have existed in the past. What the argument rejects on this interpretation is that each object has a “hard core” persisting through the three times. That today’s cup is the same as yesterday’s cup would be taken to mean that there is one thing ( perhaps the substance of the cup) that was here yesterday and is here today and that is characterized by different accidental properties at the different times. This notion of a substantial core has been criticized by Nāgārjuna in a variety of ways in earlier parts of the MMK.

On this interpretation we could then read the statement in MMK 19:4 as claiming that in the same way in which it makes no sense to speak of a persisting substance across time, there is no spatially persisting substance either. In a house that has an upper, middle, and lower part, there is not one piece of matter that runs through the entire house and is characterized by the attributes upper, middle, and lower. It is rather that different parts of the house are designated in this way in relation to one another, and that they are regarded as parts of the same house by their spatial contiguity, not because of some sort of material backbone running through all of them. Similarly the different temporal parts of the cup can be conceptualized as belonging to one individual by their temporal closeness and the sharing of a significant number of properties without the need for a persistent cross-temporal unifier.

In fact this interpretation of time which does not refer to the persistence of an underlying substance is the only way for the Mādhyamika to affirm the

\(^{111}\) It makes much more sense to interpret MMK 19:5a as noting the difficulty of a temporal regress. Here Nāgārjuna argues that one could conceive of neither a static nor of a nonstatic time. (nāṣṭito gr. hyate kālah. sātītah. kālo na vidyate) The reason is that in order to conceptualize time as static or nonstatic, we have to locate it in another time relative to which it changes or does not change.

\(^{112}\) This is the interpretation given by Tsong kha pa (2006: 397). See also Weber-Brosamer and Back (1997: 70–71).
existence of time. Since Nāgārjuna described in detail the reasons for the rejection of such a substance, he would then also be forced to deny the existence of time. The Mādhyamika therefore has to explain how we can account for an object changing and persisting through time without having to assume that there is some unchanging aspect of the object which underlies all change. Nāgārjuna claims that this can indeed be done. Understanding how this can be the case becomes particularly important in the context of the Buddhist conception of the self when the temporal continuity of persons has to be explained without reference to the concept of a persisting subjective core (ātman).

113. “If time existed dependent on an object, from where should it come without this object? Since there is not any object, from where does time come? ” bhāvam. pratītya kālaś cet kālo bhāvād rte kutah. / na ca kaścana bhāvo ’sti kutah. kālo bhaviṣyati. MMK 19:6. Note that “object” (bhāva) in this context is to be understood as “object with svabhāva.”

Including the salutation, there are sixteen verses in both the Sanskrit and the Chinese. However, the order of verses is somewhat different. Chinese 1.4 equals Sanskrit 1.5 and vice versa. Chinese 1.10 equals Sanskrit 1.11, and vice versa. (This is counting the salutation as verses 1 and 2.) A general comparison of the Sanskrit and the Chinese verses may be drawn from the following translation of the former into English and of Kumarajiva’s version into "Chinglish," an ad hoc language which has Chinese grammar and English vocabulary.
CANDRAKĪRTI COMMENTARY

[Chapter III]

KALUPAHANA COMMENTARY

Chapter One Examination of Conditions (Pratyaya-pariksa)

GARFIELD COMMENTARY

Chapter I Examination of Conditions

Central to this first chapter is the distinction between
causes and conditions (Skt: hetu and pratayaya, Tib: rgyu and
rkyen). This distinction is variously drawn and is
controversial, (fn 14. Some scholars with whom I have discussed this
interpretation argue that there is no real difference between causes and
conditions, some that a cause is one kind of condition, some that efficient
causes are causes and all other causal factors contributing to an event are
conditions. Some like my reading. I have found no unanimity on this
interpretive question, either among Western Buddhologists or among
Tibetan scholars. The canonical texts are equivocal as well. I do not argue
that the distinction I here attribute to Nāgārjuna, which I defend on
hermeneutical grounds, is necessarily drawn in the same way throughout
the Buddhist philosophical world or even throughout the Prasangika-
Mādhyamika literature. But it is the one Nāgārjuna draws.) and it is
arguably differently understood in Sanskrit and Tibetan. The
way I will understand it here, I argue, makes good, coherent
sense not only of this chapter, but of Mula-madhyamaka-
kārikā as a whole. Briefly, we will understand this
distinction as follows: When Nāgārjuna uses the word
“cause” (hetu, rgyu), he has in mind an event or state that has
in it a power (kriyā, bya-ba) (fn 15. Some might quarrel with
this translation, preferring to reserve “power” to translate “stob” (Skt: bala or shakti) and to translate “bya-ba” or “kriya” as “activity” or
“action.” But in this context “power,” interpreted as causal power, is just
right.) to bring about its effect and has that power as part of its
essence or nature (svabhāva, rang byin). When he uses the
term “condition” on the other hand (pratayaya, rkyen), he has
in mind an event, state, or process that can be appealed to in
explaining another event, state, or process without any
metaphysical commitment to any occult connection between
explanandum and explanans. In Chapter I, Nāgārjuna, we
shall see, argues against the existence of causes and for the
existence of a variety of kinds of conditions. (fn 16. There are
two kinds of causes to be made for attributing this distinction to Nāgārjuna
in this chapter: Most generally, there is the hermeneutical argument that
this makes the best philosophical sense of the text. It gets Nāgārjuna
drawing a distinction that is clearly suggested by his philosophical outlook
and that lines up nicely with the technical terms he deploys. But we can
get more textually fine grained as well; in the first verse, Nāgārjuna
explicitly rejects the existence of efficacy and pointedly uses the word
“cause.”) He denies that there are such things. Nowhere in Chapter I is
there a parallel denial of the existence of conditions. On the contrary, in I: 2
he positively asserts that there are four kinds of them. To be sure, this
could be read as a mere partitioning of the class of effects that are
described in Buddhist literature. But there are two reasons not to read it
thus: First, Nāgārjuna does not couch the assertion in one of his “it might
be said” locutions. Second, he never takes it back. The positive tone the
text takes regarding conditions is continued in I: 4-5, where Nāgārjuna
asserts that conditions are conceived without efficacy in contrast with the
causes rejected in Chapter I and where he endorses a regularist view of
conditions. So it seems that Nāgārjuna does use the “cause/”condition”
distinction to mark a distinction between the kind of association he
endorses as an analysis of dependent arising and one he rejects. Inada
(1970) among Western commentators agrees with this interpretation.
Kalupahana (1986) seems to as well (see pp. 34-35). But see Stenro (1973)
and Wood (1994) for a contrasting interpretation, according to which
Nāgārjuna is out to reject causes and conditions in the same sense, and
according to which the distinction between the four conditions provides a
platform for an exhaustive refutation of production with no positive
account of interdependence implicated. This latter interpretation is
adopted by Tsong Khapa (Sarnath ed., pp. 126f.) and his followers as well.
They attribute a like view to Candrakīrti. But I would disagree at that point
with their reading of Candrakīrti’s text.) Things are not, however,
quite this simple. For in the philosophical context in which
Nāgārjuna is writing, there are those - indeed including most
Buddhist philosophical schools - who would accept his
classification of conditions, but who would then assert that
in order for conditions to function as explanatory, they must
themselves have an independent inherent existence. Some -
such as the Sarvastivadās or Sautantrika-Svātantrikas
(despite other differences between these schools regarding
causation) - would argue that the conditions must exist as
substantially distinct from the conditioned; others, such as
the Cittamatra, would argue that they can be of the same
nature (fn 17. This account of the relevant contrastive views derives from
the oral commentary of the Yen. Geshe Yeshes Thap-Khas and the
Yen. Gen Lobzang Gyats.)., Nāgārjuna will evade these
particular debates, however, by emphasizing that the
conditions he has in mind must be thought of as empty of
inherent existence and connected to the phenomena they
condition neither through absolute difference nor through
identity.

The argument against causation is tightly intertwined
with the positive account of dependent arising and of the
nature of the relation between conditions and the
conditioned. Nāgārjuna begins by stating the conclusion (I: 1): Entities are neither self-caused nor do they come to be
through the power of other entities. That is, there is no
causation when causation is thought of as involving causal
activity: (fn 18. The Yen. Lobzang Norbu Shastri has pointed out to me
that this verse may not in fact be original with Nāgārjuna, but is a
quotation from sutra. It appears in the Kamajika-prajnaparamitasutra as
well as in the Madhyamika-Salistambasutra. But the chronological
relation of these sutras to Nāgārjuna’s text is not clear.)

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 1 - At nowhere and at no time can entities ever exist by originating out of themselves, from others, from both (self-other), or from the lack of causes.

JONES (Skt):
[i] No entities whatsoever are found anywhere that have arisen from themselves, from another, from both, or from a non-cause.

KALUPAHANA (Skt):
No existents whatsoever are evident anywhere that are arisen from themselves, from another, from both, or from no cause at all.

MCCAGNEY (Skt):
Never, nowhere do any beings occur arisen from themselves, from others, from both or from no cause.

NISHIJIMA (Skt?):
1. The Real Truth is different from subjective ideas, which have been produced in human brain, or the Real Truth is never sense stimuli, which have been received from the external world.
The Real Truth is not the mixture of the subjective ideas or the objective sense stimuli, but The Real Truth is never anything illogical. Miscellaneous things and phenomena are always manifesting themselves as they are. And what is called existence does never exist really anywhere, or does not exist in anything.

SPRUNG (Skt):
1 No things whatsoever exist, at any time, in any place, having arisen of themselves, from another, from both or without cause.

STCHERBATSKY (Skt):
I. There absolutely are no things, Nowhere and none, that arise (anew). Neither out of themselves, nor out of non-self. Nor out of both, nor at random,

ROBINSON (Skt):
No existents ever occur anywhere which have arisen from themselves, from others, from both, or without a cause.

BOCKING (Ch):
1v3 Dharmas are not self-produced, Nor do they arise from others, Nor from both, nor without a cause. Therefore we know there is no arising.

BATCHelor (Tb):
No thing anywhere is ever born from itself, from something else, from both or without a cause.

DOCTOR (Tb):
Not from itself, not from another, Not from both, and not uncaused Nowhere does anything Ever arise. [I.1]

GARFIELD (Tb):
1. Neither from itself nor from another, Nor from both, Nor without a cause, Does anything whatever, anywhere arise.

GARFIELD-SAMTEN (Tb):
1. Neither from itself nor from another Nor from both, Nor without a cause Does anything anywhere, ever arise. [Does anything whatever, anywhere arise.]

HAGEN (paraphrase):
Nothing existing is ever found to originate from itself, from another, from both itself and another, or from "out of the blue."
GOLDFIELD (Tb):
Not from self, not from other,
Not from both, nor without cause:
Things do not arise
At any place, at any time. (1)

ROBINSON (Ch):
All-the dharma not self arise, also not from other arise, not both, nut inexist cause; this reason know inexist arise.

ROBINSON (Ch - Remarks):
"This reason know inexist arise" (therefore we know that they have no arising) is entirely added by the translators.

PINGALA COMMENTARY

1/3 As to 'not self-produced'; things do not exist by arising from their own substance but invariably depend upon a host of causes. Moreover, if they did arise from their own substance then each single dharma would have two substances. One would be the produced and the other would be the producer. If things were produced from their own substance without extraneous causes, then they would have neither causes nor conditions. Furthermore, arising would in turn have an arising, and there would be an endless regression of arising.

(2b10) Where there is no self there is also no other. and why? The existence of "other" depends on the existence of "self". If there is no arising from self then there is also no arising from other. Arising "from both" involves two errors, namely arising from self and arising from other. If there were no causes and yet the myriad things existed, this would be permanence, and this is not correct. Where there is no cause there is no effect; if there were no causes and yet there were effects, then giving alms, keeping the precepts and so forth could drag you down into the hells, while the ten evils and five rebellious acts could lead to rebirth in the heavens, because there would be no causal link.

Further.

CANDRAKĪRTI COMMENTARY

[The commentary in the Introductory section above includes an analysis of this first kārikā.]

Refutation of origination

At this point fellow Buddhists interject: ‘You said that things do not arise of themselves and that makes sense because spontaneous origination is meaningless. That they do not arise both from themselves and from another makes sense too, because one of the terms has been invalidated. And it is right to repudiate the wholly absurd view that things arise without cause. But when you say “nor do things arise from what is other than themselves” that does not make sense. The illustrious one taught that things are caused by what is other than themselves.’

KALUPAHANA COMMENTARY

The four types of events referred to here are comparable to those mentioned by the Buddha at S.219-20, namely, sayamkatam paramkatam, sayamkatan ca paramkatan ca, and asayamkaramaparamkaram adhicasamuppannam. Instead of the term utpanna (arisen), which occurs only in the last phrase, here we find the occurrence of the term kata (Sk. kṛta), “done,” primarily because in the Upanisads, which served as background to the Buddha's teaching, the substantial self (atman) was looked upon more as a "personal agent," than as a substantial principle (svabhava, prakṛti, etc.). With the sophistication in philosophical thinking in the Indian schools, the "personal agent" was gradually replaced by an "impersonal substance" (svabhava). The Sarvastivadins, who came to accept a conception of substance while at the same time rejecting a "personal agent" (pudgala), failed to notice the similarity if not the identity of their implications. In this verse, Nagarjuna presents his negative thesis, which in the dedicatory verse he expressed with the eight negations. It is the thesis that he undertakes to prove in the fast twenty-five chapters. He has not provided any arguments yet, except saying that these four kinds of events are not evident. Probably he felt that these events needed further explanation before he proceeds to refute them.

However, Candrakīrti is all too impatient. His commentary on this verse is more than one tenth of his entire work (almost 65 pages), and it is a stupendous commentary filled with lot of metaphysical trivia and diatribes, mostly directed at Bhavaviveka and the Svaṭantrika tradition. After assuming that Nagarjuna had "no position" (see note on the dedicatory verses) with
which to criticize these four theories, Candrakīrti settles
down to justify the reductio ad absurdum by which the
inherent contradictions in a thesis are exposed. He realizes
that self-causation (svata-uppatti) is based on the belief in a
permanent and eternal self or substance (svabhava).
Quoting Buddhapalita, he maintains: "Things are not arisen
from self," because such arising is meaningless, (tad
utpadavaiyarthyat,). For, there is no purpose in the arising
of things that are already existent. This certainly is
Nagarjuna's criticism of a substantialist notion of a

GARFIELD COMMENTARY

1. The fourfold classification of positions with regard to
the relation between an active cause and its effect is meant to
be exhaustive. But it is important to keep in mind that
Nāgārjuna was aware of philosophical schools espousing
each of these four positions. And each of them has
something to say for itself if we begin by supposing a model
of causation involving powers as essential properties of
substantially real causes. The first view - held prominently
by Samkhya philosophers (fn 19. At least according to Tsong
Khapa's commentary on this verse.) - is that all causation is really
self-causation. A proponent of this view would argue that for
a cause to be genuinely the cause of an effect, that effect
must exist potentially in that cause. If it does not, then the
cause might exist without the effect, in which case the cause
would fail to necessitate the effect, in which case it would
not be a genuine cause. This is not to say that effects exist in
full actuality in their causes, but that they have a genuine
potential existence when their causes exist. In this case, since
the effect is present in the cause, it already has a kind of
existence prior to its appearance. And it is the fact of this
prior potential existence that accounts for the causal
character of the cause. So we can say, on this view, that a
thing's prior potential existence is what gives rise to its later
actual existence. So effects are in this sense self-caused.
The typical kind of example appealed to in order to defend this
model of causation is the seed and sprout relation. The
sprout, although only actual after germination, is potential in
the seed. Its potentiality is what makes the seed a seed of that
sprout. Moreover, on this view, the seed and sprout cannot be
distinguished as substantially different. Intuitively it
makes sense to say that they are two stages of the same
entity. But the seed is the cause of the sprout. Hence, the
proponent of this view concludes, the sprout is self-caused.

Causation from another is a more familiar way of
thinking of causation and was the dominant doctrine of
causation in the Buddhist philosophical milieu in which
Nāgārjuna was working. On this view, causes and their
effects are genuinely distinct phenomena (fn 20. I will use the
term "phenomena" throughout in the commentary as an ontologically
neutral expression to cover events, states, processes, objects, properties,
etc. Usually phenomena of several of these categories are at play at once.
Sometimes not. Where more precision is called for, I will be more
specific, unless the context makes it clear which category is relevant.).
They can be characterized and can in principle exist
independently of one another. But they are related by the fact
that one has the power to bring the other about. The relations
between parents and children is an example often appealed
to in illustrating this doctrine. Parents bring their children
into existence. But they are not identical entities.

The doctrine of causation by both self and other emerges
through a juxtaposition of the doctrine of causation-from
another and the doctrine of self-causation. Let us return to
the example of the seed. A proponent of other-causation
might point out that seeds that are not planted, watered, and
so forth, do not sprout. If the sprout were present in the seed,
these other conditions, which are manifestly other than the
sprout, would be otiose. On the other hand, the proponent of
self-causation might reply: No matter how much you water,
nourish, and exhort an infertile seed - one without the
potentially existent sprout - nothing happens. So all of the
distinct conditions in the world will not suffice absent the
potential existence of the effect. The happy compromise
doctrine that emerges is the doctrine of causation-by-both:
Effects are the result of the joint operation of the effect itself
in potentio and the external conditions necessary to raise the
effect's mode of existence from potentiality to actuality.

The fourth alternative view of causation is that things
simply spontaneously arise from no particular causes - that
there are no links at all between events. What might motivate
such a view? Well, as we shall see (and as any reader of
Sextus Empiricus, Hume, or Wittgenstein will recall), there
are powerful reasons for believing that none of the three
alternatives just rehearsed can be made coherent. And if one
believe4 that only if there were either some identity or
difference between causes and effects could there be a
relation of dependency between phenomena, one would be
forced to the nihilistic conclusion that things simply arise
causelessly. Nonetheless, Nāgārjuna notes, there are
conditions - in fact four distinct kinds - that can be appealed
to in the explanation and prediction of phenomena:
Kārikā I.2

INADA (Skt):
Verse 2 - There are four and only four relational conditions; namely primary causal, appropriating or objectively extending, sequential or contiguous, and dominantly extending conditions. There is no fifth.

JONES (Skt):
[2] There are four conditions: the effective cause, objective support within the world, continuity with previous states, and overall influence. There is no fifth condition.

KALUPAHANA (Skt):
There are only four conditions, namely, primary condition, objectively supporting condition, immediately contiguous condition, and dominant condition. A fifth condition does not exist.

MCCAGNEY (Skt):
There are only four conditions, namely hetu (cause), alambana (supporting condition), anantaram (contiguous condition) and adhipati (dominant condition). There is no fifth condition.

NISHIJIMA (Skt?):
2. The Real Truth as four are Reason, which is pervading through the Universe,
The external world, which is hanging in front of us, and the present moment, at which our action is always done,
And the Reality, which seems to be the Ruler of all things and phenomena.
But the Real Truth, which is No. 5, does never exist anywhere at all.

SPRUNG (Skt):
2 Four only are the conditions of arising: cause, objective basis, the immediately preceding condition, and the decisive factor; there is no Fifth condition. (fn This puts a Buddhist opponent's view.)

STRENG (Skt):
2. There are four conditioning causes A cause (hetu) (1), objects of sensations (2), "immediately preceding condition," (3) and of course the predominant influence (4) there is no fifth.

STCHERBATSKY (Skt):
II. Four can be the conditions (Of every thing produced),
Its cause, its object, its foregoing moment,
Its most decisive factor.

ROBINSON (Skt):
There are four conditions— the cause, the object-basis, the immediate, and the dominant. There is no fifth condition.

BOCKING (Ch) [=Skt verse 3]:
1v4 As no self-nature of dharmas
Is found in the midst of causes
So, because there is no self-nature
There is also no other-nature.

BATCHelor (Tb):
There are four conditions: Causes, objects, immediate and dominant. There is no fifth.

DOCTOR (Tb):
There are four conditions:
Causal, objective, immediately preceding,
And, likewise, the ruling.
There is no fifth condition. [I.2]

GARFIELD (Tb):
2. There are four conditions: efficient condition;
Percept-object condition; immediate condition;
Dominant condition, just so.
There is no fifth condition.

GARFIELD-SAMTEN (Tb):
2. There are four conditions. There is an efficient condition;
And similarly, there is the objective condition, Immediate condition, and the dominant condition. There is no fifth condition.
HAGEN (paraphrase):
Things appear to exist under four conditions only: 1) they show up (2) in a context (3) with a history and (4) [sometimes] by design

ROBINSON (Ch):
Cause condition, next number condition, condition condition, increase over condition, four condition produce all-the dharma. Further inexist number five condition. [3rd Verse of Chinese]

ROBINSON (Ch - Remarks):
"Produce all-the dharma" is added by the translators, probably because there is no verb in the first clause of the Sanskrit, where one would normally supply asti. The Chinese addition is interpretive, but valid. Yuan yuan 緣緣 (conditioned condition) stands for alambana-pratyaya. Kumarajiva more often than not translates alambana by yuan rather than by the unambiguous p'an-yuan 攀缘 which he sometimes uses. As a consequence Chinese Buddhists have often confused the concepts of alambana and pratyaya. See also verse 11 [=KI.8].

PINGALA COMMENTARY

1/4 No self-nature of dharmas is found in the midst of causes. Because of the combination of causes, we get nomenclature Self-nature means the same as self-substance. In the midst of causes there is no self-nature, and since self-nature does not exist there is no self-production. Since self-nature does not exist, other-nature does not exist either, and why? Because the existence of other-nature depends on the existence of self-nature. An "other-nature", for that other, is in fact a self-nature. If self-nature is refuted, then other-nature too is refuted, and therefore there cannot be production from other-nature. If self-nature and other-nature are refuted, then the idea of both together is refuted. To say "without a cause" is a great error. Arguments invoking cause can be refuted; how much more if you say "without a cause": Arising cannot be established in any of these four ways, and therefore there is no arising.

Question. An Abhidharmist would say that dharmas arise from four kinds of causes, so why do you say that there is no arising? What are these four causes?

CANDRAKÎRTI COMMENTARY

Here cause (hetu) is taken to mean the actualizing factor; that which is determined as what actualizes something else is the causal condition (hetupratyaya). When a particular mind content (dharma) arises, it arises with reference to an object (alambana) and that is its objective basis. The extinction of the immediately preceding factor (anantara) — the cause — is the condition for the arising of the effect; for example, the immediately preceding extinction of the seed is the condition for the arising of the sprout. The decisive factor (adhipateya) is the factor because of whose existence something else will come to be.

These are the four conditions of arising. Such factors as prior, simultaneous or subsequent origination are included in them. Conditions such as ‘god’ in no way exist. Hence the restriction ‘there is no fifth condition’. It follows that things do arise from other existing things: this is called ‘arising from another’.

In reply we say that nothing whatsoever arises from conditions which are other than itself.

KALUPAHANA COMMENTARY

Candrakirti’s comments on this verse have misled almost everyone who analysed the contents of this chapter. He could not have been unaware that the theory of four conditions (pratyaya) was presented for the first time by the Abhidharmikas. However, he failed to distinguish the Abhidharma theory (see AK 2.61-62) from those of the interpreters of the Abhidharma, namely, the Sarvastivadins (like Vasumitra) and the Sautrantikas (see Akb p). He simply assumed that the theory of conditions represents an instance of external causation. Hence his statement: "Therefore, since things arise from those that are external, there is arising from another" (tasmad ebhyah parabhutebhyo bhavanam utpattir asti parata-utpattir iti, p. 77).

In the first place, such an interpretation would leave a rather tainted image of Nagarjuna as an unsystematic philosopher, for having spoken of four causal theories beginning with self-causation (svata-utpatti), Nagarjuna is
here represented as elaborating upon the second, namely, external causation (parata-utpatti), ignoring self-causation altogether.

Secondly, while the four causal theories mentioned in I.1 are categorically denied by Nagarjuna, no such denial is made of the four theories of conditions (pratyaya). Thus, unlike Candrakīrti, Nagarjuna seems to have accepted the Abhidharmika theory of four conditions, without characterizing it either as self-causation or as external causation. After stating the Abhidharma theory, Nagarjuna then proceeds to analyze the views of the interpreters of Abhidharma, and, as the verse that immediately follows (I.3) seems to indicate, be found that these are the ones who produced theories of self-causation (svata-utpatti) and external causation (paratautpatti) out of the Abhidharma theory of conditions (pratyaya).

GARFIELD COMMENTARY

2. The general classification of conditions Nāgārjuna employs is pretty standard in Indian and especially in Buddhist accounts of explanation. But there are two specific features of Nāgārjuna’s presentation that should be noted: First, since he is writing with specifically soteriological goals in mind, which require the practitioner to develop a deep insight into the nature of his/her own mind, there is a specifically psychological emphasis in the presentation. We must be aware both of this emphasis and of the natural generalization away from that particular domain that the account supports. Second, it will be of paramount importance to Nāgārjuna that the analysis of the relation of conditions to the conditioned involves ascribing neither inherent existence nor causal power to the conditions. Efficient conditions are those salient events that explain the occurrence of subsequent events: Striking a match is the efficient condition for its lighting. My fingers depressing the keys of this computer is the efficient condition for the creation of this text. The percept-object condition is in its primary sense the object in the environment that is the condition for a mind’s perception of it. So when you see a tree, the physical tree in the environment is the percept-object condition of your perceptual state. Now things get vexed here in a number of ways. First, there is no unanimity in the world, or even in Buddhist philosophy, regarding the analysis of perception and, hence, no consensus on the view just adumbrated that external objects are the percept-object conditions of perceptual awareness. Idealists, for instance, argue that the percept-object conditions are to be located in the subject. Second, many fans of percept-object conditions, on both sides of the idealist/realist divide, argue that the substantial existence of such a condition, and the appropriate exercise of its power to produce perception, is a necessary condition of perception. Nāgārjuna will be concerned to reject any such analysis - whether idealist or realist - in virtue of his attack on the notions of substantial existence, substantial difference, and causal power. Third, within the psychological domain, the account generalizes beyond perception. Conceptual states, imaginings, reasoning - all can have percept-object conditions. To Western philosophical ears this seems odd. But from the standpoint of Buddhist epistemology and psychology, intentional (fn 21. “Intentional” is here being used in the sense of Brentano and of recent Western philosophy of mind - to mean contentful or directed upon an object. I do not use the term to mean purposeful.) activity generally is the natural kind comprised by “perception.” So the point is that the intentional existence of the golden mountain is a percept-object condition of my being able to doubt that there is such - a thing. Finally, the analysis bears generalization well beyond the psychological. For at the most abstract level, what is distinct about a percept-object condition is its existence simultaneously with and as a support for what it conditions. So Nāgārjuna’s attack on a substantialist understanding of this kind of explanans will apply, mutatis mutandis, to the case of a table supporting a book.

The dominant condition is the purpose or end for which an action is undertaken. My hoped for understanding of Madhyamika might be the dominant condition for my reading Nāgārjuna’s text, its presence before my eyes the percept-object condition, and the reflected light striking my eyes the efficient condition. The immediate conditions are the countless intermediary phenomena that emerge upon the analysis of a causal chain, in this case, the photons striking my retina, the excitation of photoreceptor cells, and so forth. (fn 22. Georges Dreyfus (personal communication) notes that the understanding of the nature of percept-object conditions and dominant conditions in Mahayana Buddhist philosophy undergoes a significant transformation a few centuries later at the hands of Dignaga and Dharmakīrti and that Nāgārjuna is here making use of older Sarvastivadin understandings of these terms to demonstrate the emptiness of conditions so understood.)

A nonpsychological example might be useful to illustrate the difference between “the four kinds of condition and the picture Nāgārjuna suggests of explanation in the most general sense: Suppose that you ask, “Why are the lights on?” I might reply as follows: (1) “Because I flicked the switch.” I have appealed to an efficient condition. Or, (2) “Because the wires are in good working order, the bulbs haven’t burned out, and the electricity is flowing.” These are supporting conditions. Or, (3) “The light is the emission of photons each of which is emitted in response to the bombardment of an atom by an electron, and so forth.” I have appealed to a chain of immediate conditions. Or, (4) “So that we can see.” This is the dominant condition. Any of these would be a perfectly good answer to the “Why?” question. But note that none of them makes reference to any causal powers or necessitation. (fn 23. Wood (1994) argues (see esp. pp. 48-53, pp. 63-64) that Nāgārjuna here argues that nothing arises at
all. He claims that the argument begins by providing an exhaustive
enumeration of the ways in which a thing could arise and then proceeds to
eliminate each of these. This analysis, however, is problematic on two
counts: First, it ignores the distinction between conventional, dependently
arisen phenomena and inherently existent phenomena. To say that
inherently existent phenomena cannot arise in any way, or that there can
be no inherently existent production, is not thereby to say that there is no
conventional dependency, or that there are no dependently arisen
phenomena. Second, Wood ignores the positive account of on conditions
presented in this chapter. His interpretations of the various commentaries
that he cites in defense of this nihilistic reading are similarly marked by
inattention to this set of distinctions, which I (and many others, including
both canonical and modern interpreters) argue are crucial to understanding
this text. Wood says, “If Nāgārjuna wished to avoid the nihilistic
conclusion that things do not originate period, he would never have said in
1.1a that things do not arise. Furthermore, he would either have had to
specify the way that things do arise, but in some miraculous or
inexplicable way” (p. 63 [emphasis in original]). But on my reading at I: 1,
Nāgārjuna does not say that things do not arise period. He simply says that
they do not arise by means of an inherently existent causal process. And
he does both here and in subsequent chapters explain how things arise in a
decidedly nonmiraculous way. But see Nagao (1989) for an interpretation
in accord with my own: “Dependent co-arising refers to a causal
relationship wherein no essence is present at any time in either cause or
result. Thus the sentence ‘Nothing arises from itself; nothing arises from
another,’ is not intended to refute arising. It is a negation of others that
might be explained as ‘from themselves’ or ‘from others.’ “ (p. 7)

The next three verses are crucial to Nāgārjuna’s
understanding of the nature of conditions and their role in
explanation. Nāgārjuna first notes (I: 3) that in examining a
phenomenon and its relations to its conditions, we don’t find
that phenomenon somehow contained potentially in those
conditions:
Kārikā I.3

na hi svabhāvo bhāvānāṃ pratayādiṣu vidyate |
avidyamāṇe svabhāve parabhāvo na vidyate ||3||

yīn yuán  cì di yuán yuán yuán zēng shàng yuán

| bdag gi dṅos po yod min na | | gźan dṅos yod pa ma yin no |

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 3 - In these relational conditions the self-nature of the entities cannot exist. From the non-existence of self-nature, other-nature too cannot exist.

JONES (Skt):
[3] The self-existence of entities is not found in their conditions; and if there is no self-existence, no other-existence (i.e., the self-existence of something else [15.3]) can be found either.

KALUPAHANA (Skt):
The self-nature of existents is not evident in the conditions, etc. In the absence of self-nature, other-nature too is not evident.

MCCAGNEY (Skt):
Indeed, no self-nature (own-being, essence) of beings occurs in the conditions of beings. Since self-nature is not present, other nature does not occur.

NISHIJIMA (Skt?):
3. A Real Act to go belong to the motion of going, And so how is it necessary for a Real Action to have any kind of different name at all. The states of going on have always have the two kinds of going, that is, the motion of going, and the other is the progress of going., Therefore in that case there is no new appearance at all.

SPRUNG (Skt):
3 If there are conditions, things are not self-existent; if there is no self-existence there is no other-existence. (fn parabhava existence-as-other, or existence-in-dependence-on-other.)

STASHEVSKY (Skt):
III. In these conditions we can find No self-existence of the entities. Where self-existence is deficient, Relational existence also lacks.

ROBINSON (Skt):
For own-being of existents does not occur in the conditions, etc., when own-being does not occur, other-being does not occur.

BOCKING (Ch) [=Skt verse 2].
1v5 Causal condition, sequential cause Objective cause, predominant cause.
Four causes produce all dharmas.
There is no fifth beyond these.

BATCHelor (Tb):
The essence of things does not exist in conditions and so on. If an own thing does not exist, an other thing does not exist.

DOCTOR (Tb):
The nature of things is not in conditions and so forth. If there is no thing itself, How could there be anything other? [I.3]

GARFIELD (Tb):
3. The essence of entities Does not exist in such things as the conditions. If the entity that is self does not exist, The entity that is other does not exist.

GARFIELD-SAMTEN (Tb):
3. The essence of entities Does not exist in the conditions as they unfold, and since selfhood is not evident, other-dom is also not evident.
If all-the dharma own nature not be-there in condition inside, through inexist own nature reason, other nature also again inexist. [2nd Verse of Chinese]

The Chinese translates hi (for) by ju 如 (if, as). The Chinese does not translate adi (etc.) and does not show the plural of -adisu.

ROBINSON (Ch - Remarks):

PINGALA COMMENTARY

1/5 All causes which exist may be summed up as four causes, and through these four causes all things are produced. 'Causal condition' refers to all active dharmas. 'Sequential cause' refers to the dharmas of all past and present thoughts and mental configurations except the very last thoughts and mental configurations of past and present arhats. 'Objective cause' and 'predominant cause' apply to all dharmas.

CANDRAKĪRTI COMMENTARY

If, in any way, things which arise as effects and which are other than their conditions truly pre-existed in them, either in all collectively or in each singly, or both together, or indeed elsewhere, then the effect would arise from them. But something cannot, in this sense, exist prior to its arising. If it could, it would be observed, and its arising would be purposeless. Hence if there are conditions of arising, there is no self-existence of things. But if there is no self-existence there is no other-existence (parabhava). Coming into existence is to exist, which is to arise. To arise from what is other is to exist in dependence on the other. But there is no such thing. So it does not make sense to say that things arise from what is other than themselves.

Or again it might be argued that things caused, like sprouts, do not exist as such in their causes seeds or whatever it is; their nature is to transform themselves; otherwise it would follow that there was no cause at all.

What is this relation of ‘otherness’ (paratva) of conditions? If Maitra and his fellow worker co-exist, their reciprocal relationship is ‘otherness’. But there is no such co-existence of seed and sprout. So, as effects are not in fact self-existent, the seeds and so on cannot exist as other, i.e., there is no ‘otherness’. As the very term ‘other’ does not hold, there can be no arising from an ‘other’. This is sheer ignorance of the meaning of the scriptures. The fully realized ones could never utter pronouncements contrary to sense. The intent of the scriptures was explained earlier.

Refutation of origination from generative force

The proponent of origination from conditions is thus disposed of. There is a proponent of origination from generative force (kriya). Vision, colour, and the other conditions do not generate visual consciousness (the sensation or perception as mental content) directly, but are called conditions because they give rise to the force which generates perceptual consciousness. It is this force which generates the perception (vijnana). Therefore this force generating the perception inheres in the conditions; the conditions do not give rise to perceptual consciousness. It is like the force which cooks rice.

Nagarjuna says

KALUPAHANA COMMENTARY

These indeed are the most significant statements of Nagarjuna in the present chapter. The fret statement is not a simple but an emphatic denial (na hi) of the view that the substance or self-nature (svabhava) of an existent is found in the condition (pratyaya). Since the theory of conditions is primarily a Buddhist theory, and since among the Buddhist schools the first to advocate a theory of substance (svabhava, dravya) at this early stage was the Sarvastivada school, there can be little disagreement that Nagarjuna’s statement represents an outright rejection of the Sarvastivada interpretation of the conditions.

This denial needs to be carefully analysed. In the first place, as noted earlier, the phrase used to express the denial is na vidyate (“is not evident”) and not na yujyate (“not proper”) or na upapadyate (“not appropriate”). Hence
the denial should be empirically grounded. Secondly, there is no outright denial of the "conditions" (pratyaya) but only of self-nature (svabhava). Neither the Buddha nor the early Abhidharmikas assumed that identity, defined as permanent substance or self-nature, is a necessary condition for the explanation of conditions or of dependence (pratityasamutpada).

When no such absolute identity is perceived, is it the case that absolute difference is perceived? This would be the case only if the perceptions are confined to the two extremes (anta), not otherwise. In the "Discourse to Katyayana," the Buddha maintains that he will teach a "middle position" without approaching (upagamma) the two extremes of existence and non-existence. This means that he was providing an explanation of existence without relying upon this particular form of explanation. And that middle position allows for an explanation of experience or perception of arising and ceasing in terms of dependence. It is indeed a similar view of existence and non-existence that Nagarjuna is denying, without, at the same time, denying the doctrine of conditions (pratyaya) or of dependence (pratityasamutpada).

GARFIELD COMMENTARY

3. The point being made in the first two lines of the verse is fairly straightforward. When we examine the set of conditions that give rise to an entity - for example, the set of conditions we detailed above for the shining of a lamp, or the conditions for seeing a tree we discussed previously - no analysis of those conditions yields the consequent effect. Dissecting light switches, wires, brains, and so forth, does not reveal any hidden light. Nor is there a tree perception to be found already in the existence of the tree, the eye, and so forth. Rather these phenomena arise as consequences of the collocation of those conditions. To borrow a Kantian turn of phrase, phenomena are not analytically contained in their conditions; rather, a synthesis is required out of which a phenomenon not antecedently existent comes to be.

But Nagarjuna, through his use of the phrase "the essence of entities" (dngos-po rnams kyi rang bzhin), emphasizes a very important metaphysical consequence of this observation: Given that phenomena depend upon their conditions for their existence and given that nothing answering to an essence of phenomena can be located in those conditions and given that there is nowhere else that an essence could come from, it follows that phenomena that arise from conditions are essenceless. One might argue at this point that just as phenomena come into existence dependent upon conditions, their essences come into existence in this way. But what goes for phenomena (fn 24. Especially given the analysis Nagarjuna will develop of phenomena as empty. See especially chapters XV, XVIII, XXIV.) does not go for essences. For essences are by definition eternal and fixed. They are independent. And for a phenomenon to have an essence is for it to have some permanent independent core. So neither essences nor phenomena with essences can emerge from conditions.

The next two lines require a careful gloss, both because of the complexity of the philosophical point at stake and because of the Buddhist philosophical term of art I translate as "otherness-essence" (Skt: parabhāva, Tib: gzhan dngos). Let us begin by glossing that term. In its primary sense it means to have, as a thing's nature, dependence upon another for existence. So for a table, for instance", to have otherness-essence, according to a proponent of this analysis of the nature of things, might be for it to have as an essential characteristic the property of depending for its existence on some pieces of wood, a carpenter, and so forth. This way of thinking of the nature of things has great appeal - was used by those who defended the analysis of causation as production from other and the analysis of causes and their effects according to which they are linked by causal powers inhering in the causes - particularly for other Buddhist schools who would want to join with Nagarjuna in denying essence to phenomena. For such a philosopher, it would be congenial to argue that the table has no essence of its own, but has the essential property of depending on its parts, causes, and so forth - an essential property that depends critically on another. And it would then be important to note that this nature relies on the other having an intrinsic connection to the phenomenon in question, a connection realized in the causal powers (or other inherently existent relation to the effect) of that other and, hence, in the other's own nature. Moreover, it is crucial to such an analysis, if it is not to lapse into the absurdities that plague self-causation, that there be a real, substantial difference in entity - a difference in intrinsic nature between the dependent phenomenon and the conditions on which it depends. Absent such a difference, the otherness required in the analysis cannot be established. (fn 25. Streng (1967) makes a similar point. See pp. 44-45.) Given this understanding of otherness-essence, we can see the arguments Nagarjuna is ostending in the last two lines of this verse. First, since all entities are without their own essences (that is, without essences that can be specified intrinsically without reference to anything else), the other with respect to which any phenomenon is purportedly essentially characterized will be without an essence, and so there will be no basis on which to build this otherness-essence. Second, without individual essences, there will be no basis on which to draw the absolute, essential distinctions necessary to establish phenomena as intrinsically other than their conditions. Without individual essences there are not substantial differences. Without
substantial differences, there are no absolute others by means of which to characterize phenomena. Third, in order to characterize phenomena as essentially different from their conditions, it is important to be able to characterize them independently. Otherwise, each depends for its identity on the other, and they are not truly distinct in nature. But the whole point of otherness-essence is that things in virtue of having it are essentially dependent. So the view is in fact internally contradictory. Given that things have no intrinsic nature, they are not essentially different. Given that lack of difference, they are interdependent. But given that interdependence, there cannot be the otherness needed to build otherness-essence out of dependence.

Now, on the reading of this chapter that I am suggesting, we can see conditions simply as useful explanans. Using this language, Nāgārjuna is urging that even distinguishing between explanans and explanandum as distinct entities, with the former containing potentially what the latter has actually, is problematic. What we are typically confronted with in nature is a vast network of interdependent and continuous processes, and carving out particular phenomena for explanation or for use in explanations depends more on our explanatory interests and language than on joints nature presents to us. Through addressing the question of the potential existence of an event in its conditions, Nāgārjuna hints at this concealed relation between praxis and reality.

Next, Nāgārjuna notes (I: 4) that in invoking an event or entity as a condition in explanation, we do not thereby ascribe it any causal power:
Kārikā I.4

ENGLISH TRANSLATIONS

STCHERBATSKY (Skt):
IV. No energies in causes, Nor energies outside them. No causes without energies, Nor causes that possess them,

DOCTOR (Tb):
Actions do not have conditions, Yet there are no actions without conditions. Without an action there are no conditions, Yet no conditions are involved in an action. [I.4]
ROBINSON (Ch):
Effect is-it from condition arise? Is-it from non condition arise? This condition is-it have effect? This condition is-it have-no effect?

ROBINSON (Ch - Remarks):
The Sanskrit negates the alternatives, while the Chinese poses them as affirmative alternative questions. Kuo 果 (effect) points to a Sanskrit karya rather than kriya (Hatani, Chukanbu I, p. 65, n. 27). If Kumarajiva read karya, though, he could not have read the feminine

PINGALA COMMENTARY
1/6 If, as you say, there are effects, do these effects arise from causes, or do they arise from non-causes? If as you say, there are causes, do these causes have effects or do they have no effects? Both of these are wrong, and why?

CANDRAKĪRTI COMMENTARY
4a Force is not inherent in conditions
If there were any such force it would, being inherent in the conditions, generate perceptual consciousness by means of the eye and the other conditions. But it is not so. Why? Should this force be supposed after the perception exists, or before it exists or even as it is generated? To suppose it after the perception exists makes no sense because a force produces something real. If something has been produced what need would it have of a force? This has been made clear in the Madhyamakavatara in such passage(s): “A second birth of what is already born makes no sense.”

Supposing a force before the perception exists makes no sense either. To quote the Madhyamakavatara again: ‘Generation cannot, intelligibly, take concrete form in the absence of an agent.’ Nor is force possible which is born simultaneously with the generation of the perception because there can be no generation independently of what is generated or not generated.

As has been said: ‘What is being generated is not generated, because it is only half generated; else it follows that absolutely everything is in the state of being generated.’ As, thus, a generative force is not possible in past, present or future it follows that such does not exist. That is why Nagarjuna says: ‘Force is not inherent in conditions.’ In the Madhyamakavatara it is explained ‘There can be no characterization without something characterized.’ The son of a barren woman cannot be said to possess a cow.

4b Nor is generative force not inherent in conditions.
If generative force is not inherent in conditions, how could it exist as non-inherent, for it would be non-causal? How could it be supposed to be sensible that if cloth is not inherent in threads it is inherent in coarse grass? It follows that generative force does not generate things. If someone objects: ‘If it is impossible that causation stems from generative force, then conditions themselves will generate things’, Nagarjuna continues:

4c There are no conditions without generative force.
If there is no force then conditions will lack generative force, will have no inherent force, will be non-causal. How will they give birth to anything? But as they give birth to something they do possess generative force.

Nagarjuna concludes:
4d But conditions have no generative force.
The negation derives from the kārikā as a whole; the word ‘but’ adds emphasis. The meaning is that generative forces do not exist. How can there be generative forces in conditions? As it was claimed that there is a force generating perceptual consciousness, so should similar forces be understood. There is no origination of things from forces. The very term ‘arising’ is devoid of meaning.
Refutation of conditions

Someone may object: What is the point of this discussion concerning conditions having inherent force? After all some things, such as perceptual consciousness, arise in dependence on other things, such as the eye, as their conditions. Therefore the eye and so on are ‘conditions’ because perceptual consciousness arises from them.

Nagarjuna says that this makes no sense either:

KALUPAHANA COMMENTARY

The former reads santy atu, which is corrected in the latter as santy uta. The term kriya, used in philosophical discourse, can convey two meanings. First, it can refer to an inherent activity, a power or potentiality (sakti) in something to produce an effect (artha). Activity would then be an embodiment of a condition (kriya pratyayavati) or a condition would be an embodiment of activity (pratyaya kriyavantah). In either case, the activity or the condition is said to produce the effect (artha). This, once again, is the substantialist interpretation of causation. If the philosophical explanation of experience is confined to the two alternatives, then the contrasting view would be that activity is not an embodiment of a condition (apratyayavatikriya) or that a condition is not an embodiment of activity (pratyaya akriyavantah). And Nagarjuna says no to both extremes.

The denial of the above extremes does not mean the denial of a second meaning that can be attributed to both kriya and pratyaya, namely, the pragmatic view which defines both in terms of the effect (artha). Nagarjuna was not unaware of such an explanation of activity, for in the Buddhist context kriya is generally identified with arthakriya (-karitra) or simply karitra.

GARFIELD COMMENTARY

4. This is the beginning of Nāgārjuna’s attack on the causal power/cement-of-the-universe view of causation and his contrastive development of his regularity view of conditioned dependent arising. Causal powers, according to those who posit them, are meant to explain the causal nexus - they are meant to explain how it is that causes bring about their effects, which is itself supposed to be otherwise inexplicable. But, Nāgārjuna argues, if there were a causal power, it itself, as a phenomenon, would either have to have conditions or not. If the former, there is a vicious explanatory regress, for then one has to explain how the powers to act are themselves brought about by the conditions, and this is the very link presupposed by the friend of powers to be inexplicable. One could posit powers the conditions have to bring about powers and powers the powers have to bring about effects. But this just moves one step further down the regress.

If, on the other hand, one suggests that the powers have no condition, one is stuck positing uncaused and inexplicable occult entities as the explanans of causation. If what is to be explained is how it is that all phenomena are brought about by causal processes, it is a bit embarrassing to do so by reference to unobserved entities that are explicitly emptied from this otherwise universal condition. Moreover, there is then no explanation of how these powers arise and why they come to be where they are. This is all startlingly anticipatory of Wittgenstein’s famous echo of Hume in the Tractatus: 6.371 The whole modern conception of the world is founded on the illusion that the so-called laws of nature are the explanations of natural phenomena. 6.372 Thus people today stop at the laws of nature, treating them as something inviolable, just as God and Fate were treated in past ages. And in fact both are right and both are wrong: though the view of the ancients is clearer in so far as they have a clear and acknowledged terminus, while the modern system tries to make it look as if everything were explained. (fn 26. There is, as Tuck (1990) has noted, a current fashion of using Wittgenstein to explicate Nāgārjuna and other Mādhyamika philosophers. Most (e.g. Huntington [1983a, 1983b, 1989], Gudrunson [1977], and Thurman [1984]) emphasize connections to the Philosophical Investigations, indeed with good reason. But (as Waldo [1975, 1978] and Anderson [1985] as well as Garfield [1990, 1994, unpublished] have noted) the Tractatus is also a useful fulcrum for exegesis, particularly of Nāgārjuna’s work. Tractarian ideas also inform my discussion of Nāgārjuna on positionlessness, the limits of expressibility, and the relation between the two truths below. None of this, however, should be taken either as implying that Nāgārjuna would agree with everything in the Tractatus (assuredly he would not) or that the parallels drawn between Mādhyamika philosophy and themes in the Philosophical Investigations are spurious. They are in fact often quite illuminating.) In the next two lines, as we will often see in the text, Nāgārjuna is speaking in two senses - first, from the conventional standpoint, and second, from the ultimate. In the third line of the verse, he notes that conditions can certainly, in a perfectly legitimate sense, be appealed to as the things that bring about their effects; in that sense, we can say that they are efficacious - that they have the power to act. But in the fourth line he emphasizes that we cannot, so to speak, quantify over this power, identifying it as a phenomenon or property possessed by the conditions. There are no powers in that sense. Just as we can act for someone else’s sake, despite there being no sakes, we can appeal to the potency of conditions despite their being no such potency. The trick is to make correct use of
conventional locutions without reifying denotata for all of the terms. For example, we might ask a farmer, “Do these seeds have the power to sprout?” as a way of asking whether they are fertile. It would be then perfectly appropriate for him to answer in the affirmative. But if we then asked him to show us where in the seed the power is located, he would be quite justified in regarding us as mad. (fn 27. This example was suggested to me in conversation by the Yen. Geshe Lobzang Gyatso.)

Our desire for light does not exert some occult force on the lights. Nor is there anything to be found in the flicking of the switch other than the plastic, metal, movement, and connections visible to the naked eye. Occult causal powers are singularly absent. On the other hand, Nāgārjuna points out in this discussion that this does not mean that conditions are explanatorily impotent. In a perfectly *ordinary* sense - not the sense that the metaphysicists of causation have in mind - our desire *is* active in the production of light. But not in the sense that it contains light potentially, or some special causal power that connects our minds to the bulbs. What is it, then, about some sets of event pairs (but not others) that make them dependently related if not some causal link ‘present in those cases but not in others?’

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 5 - Only as entities are uniquely related and originated can they be described in terms of relational conditions. For, how can non-relational conditions be asserted of entities which have not come into being?

JONES (Skt):
[5] Conditions are called “conditions” because something arises dependent upon something else. But as long as that “something” does not arise, why are the conditions not really non-conditions?

KALUPAHANA (Skt):
These are conditions, because depending upon these [others] arise. So long as these [others] arise, why are they not non-conditions?

MCCAGNEY (Skt):
What arises “depends” on these so-called conditions. So long as there is no arising, how are these not non-conditions?

NISHIJIMA (Skt?):
5. In the continuity of going on, and in the Real Action of going on, What is called the attached situations may be the two kinds of separated parts, The one is just the concrete facts of continuous going on, And the other is just the Real Act here, which is the Real Action to go here again.

SPRUNG (Skt):
5 Let those things, dependent on which something arises, be conditions; how will such things not be non-conditions so long as nothing arises?

STCHERBATSKY (Skt):
V. Let those facts be causes With which coordinated other facts arise, Non-causes will they be, So far the other facts have not arisen.

WESTERHOFF (Skt):
I.5 Something is called ‘condition’ because in dependence on it something else arises. But as long as the second something does not arise, why do we not refer to the first something as a ‘non-condition’?

ROBINSON (Skt):
When [anything] arises having depended on these, these are indeed conditions. So long as this is not arisen, why are these not non-conditions?

BOCKING (Ch):
1v7 When an effect arises from a certain dharma, This dharma is called a cause. If such an effect has not yet arisen, How can we not call it a non-cause?

BATCHelor (Tb):
Since something is born in dependence upon them, then they are known as “conditions”. As long as it is not born, why are they not non-conditions?

DOCTOR (Tb):
They are known as conditions Because things arise in dependence on them. Yet as long as nothing arises, Why would they not be non-conditions? [I.5]

GARFIELD (Tb):
5. These give rise to those, So these are called conditions. As long as those do not come from these, Why are these not non-conditions?

GARFIELD-SAMTEN (Tb):
5. Since in dependence on these there is arising, These are called conditions. As long as those do not arise, Why are they not nonconditions?
HAGEN (paraphrase):  
[We may think] effects depend on conditions, but how can what does not appear as an object (i.e. field-like conditions) depend on conditions?

ROBINSON (Ch):  
Rest-on this dharma arise effect, this dharma name be condition. If/when this effect not-yet arise, why not name non condition?

ROBINSON (Ch - Remarks):  
The translators supply kuo 果 (effect), which corresponds to a remote antecedent of utpadyate (arises), and shih fa 是法 (this dharma/dharmas), which corresponds to the pronouns iman and ime. This is a good explicative paraphrase.

PINGALA COMMENTARY

1/7 All causes are indeterminate, and why? Because if their effects have not yet arisen, then they are not yet called causes. I is only because we see with our eyes effects arising out of causes that we declare them to be causes. They become causes by virtue of the effects. Since the effects follow after and the causes go before, when there is not yet any effect how can we call something a cause? It is like a jug, produced through the combination of water and earth.

CANDRAKĪRTI COMMENTARY

If perceptual consciousness arises dependent on the eye, colour and so on as conditions, then these are said to be its conditions. But surely as long as what is called the perception — the ‘effect’ — has not arisen, the eye, colour and so on cannot fail to be non-conditions? The meaning is that they are non-conditions. There can be no arising from non-conditions, even as sesame oil cannot arise from grains of sand.

Again’ there might be this thought: What are at one time non-conditions become causally effective through relationship to some other condition. But this makes no sense either. The very condition which is other than the non-condition but is supposed to be its causal efficacy will itself be a cause only if it really is causally efficacious. In this case precisely the same consideration arises as before, and it does not make sense.

If, in this example, the eye, colour and so on are conceived as the conditions of perceptual consciousness, they must be conceived as the conditions of either an existing or of a non-existing perception. But Nagarjuna says there is no way in which either can make sense.

KALUPAHANA COMMENTARY

The first line of this verse presents a definition of a condition (pratyaya) that would satisfy the pragmatic sense referred to earlier and therefore would be acceptable to the early Buddhist as well as Nagarjuna. However, Nagarjuna wants to make sure that there are no metaphysical interpretations of this definition of condition. Would someone assume that for this statement to be true the dependence has to be invariable and eternal? In fact, the Sarvastivada notion of self-nature, in terms of which they defined a condition, implied such eternalism. In spite of the Sarvastivada assertion, no such guarantee can be given on empirical grounds. If so, it is appropriate to ask the question as to whether the so-called condition has to be called a non-condition so long as the effect does not arise. This means that it is inappropriate to say that a condition is such by its own nature (svabhava). Instead, it becomes a condition depending upon the arising of the effect.
5. (“So these are called” - fn 28. The verb here is "grog" (Skt: kilo), which indicates that the embedded content is not endorsed. That is, the first two lines of this verse are in the mouth of the opponent.)

One might answer this question, Nāgārjuna notes in the opponent’s suggestion in the first two lines, by noting the presence of some relation of “giving rise to,” realized in a power. But, he rejoins in the final two lines, this move is blocked: For having shown the absence and the theoretical impotence of such a link, it would follow that there would be no conditions. Nāgārjuna hence suggests here that it is the regularities that count. Flickings give rise to illuminations. So they are conditions of them. If they didn’t, they wouldn’t be. Period. Explanation relies on regularities. Regularities are explained by reference to further regularities. Adding active forces or potentials adds nothing of explanatory utility to the picture. (fn 29. The Madhyamika position implies that we should seek to explain regularities by reference to their embeddedness in other regularities, and so on. To ask why there are regularities at all, on such a view, would be to ask an incoherent question: The fact of explanatorily useful regularities in nature is what makes explanation and investigation possible in the first place and is not something itself that can be explained. After all, there is only one universe, and truly singular phenomena, on such a view, are inexplicable in principle. This may connect deeply to the Buddha’s insistence that questions concerning the beginning of the world are unanswerable.)

In reading the next few verses, we must be hermeneutically cautious, and pay careful attention to Nāgārjuna’s use of the term “existent” (Tib: yod-pa, Skt: sat) and its negative contrastive “nonexistent” (Tib: med-pa, asat). For Nāgārjuna is worried here about inherent existence and inherent nonexistence, as opposed to conventional existence or nonexistence. For a thing to exist inherently is for it to exist in virtue of possessing an essence - for it to exist independently of other entities and independently of convention. For a thing to be inherently nonexistent is for it to not exist in any sense at all - not even conventionally or dependently. With this in mind, we can see how Nāgārjuna defends dependent arising while rejecting causation:
Kārikā I.6

naivāsato naiva sataḥ pratyayo ’rthasya yujyate |
asataḥ pratyayāḥ kasya sataś ca pratyayena kim ||6||

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 6 - Relational condition does not validly belong to either being or non-being. If it belongs to being, for what use is it? And if to non-being, for whose use is it?

JONES (Skt):
[6] A condition is not admitted for either what is not real or for what is real: if something is nonexistent, how could it have a condition? And if something is already existing, how could it have a condition?

KALUPAHANA (Skt):
A condition of an effect that is either non-existent or existent is not proper. Of what non-existent [effect] is a condition? Of what use is condition of the existent [effect]?

MCCAGNEY (Skt):
Neither being nor nonbeing are associated with conditions of usefulness.
Of what [use] are conditions for nonbeing? And to whom [is there use] in conditions for being?

NISHIJIMA (Skt?):
6. The two factors, the one is a person to go and the other is an Action to be done, are combined into one,
The two factors of the Real Action to go, that is, a person to go, and an Action to be done, are combined into one confirmedly.
Generally speaking, a person, who is criticized by others, is prone to be the objects of others’ censure.
Therefore the problem of Action to go itself is prone to disappear naturally.

SPRUNG (Skt):
6 A condition either of what exists or of what does not exist makes no sense: How could there be a condition of the non-existent and how can ‘condition’ apply to what exists?

STTERBATSKEY (Skt):
VI. Neither non-Ens nor Ens Can have a cause.
If non-Eus, whose the cause?
If Ens, what for the cause?

ROBINSON (Skt):
It is not valid that an existing thing have a condition, nor that a non-existing one. What non-existing one has a condition? And what use is a condition to an existing one?

STCHERBATSKY (Skt):
VI. Neither non-Ens nor Ens Can have a cause.
If non-Eus, whose the cause?
If Ens, what for the cause?

BOCKING (Ch):
1v8 An effect already given in a cause Can neither exist nor not exist
If previously non-existent, what would the cause produce?
If already existent, why would the cause be needed?

BATCHelor (Tb):
It is impossible for something that either exists or not to have conditions. If it were non-existent, of what would they be the conditions? If it were existent, why would it need conditions?

DOCTOR (Tb):
Neither for the nonexistent, nor for the existent, Could there possibly be conditions.
For the nonexistent, what would be conditioned?
For the existent, what role could conditions play? [I.6]

GARFIELD (Tb):
6. For neither an existent nor a non-existent thing Is a condition appropriate.
If a thing is non-existent, how could it have a condition?
If a thing is already existent, what would a condition do?

GARFIELD-SAMTEN (Tb):
6. For neither an existent nor a nonexistent thing Is a condition possible:
If a thing is nonexistent, of what would its condition be the condition?
If a thing is already existent, what would a condition do?
PINGALA COMMENTARY

1/8 There is no prior existence of effects in causes, nor prior non-existence. If an effect already existed, nothing could be called its cause, since the effect was already existent. Similarly, if the effect was all the time inexistent we could not describe something as its cause, since it would not have produced any further entity.

CANDRAKÎRTI COMMENTARY

6 A condition (in Pratyaya: In this passage one would think 'cause' in English) either of what exists or of what does not exist makes no sense:

And so he says:

How could there be a condition of the non-existent and how can 'condition' apply to what exists?

If something is non-existent, how can there be a condition of what factually is not? If some future existent is meant, something that will be, this won’t do. ‘One may refer to a future something, but it cannot be created without a present force.’ (Madhyamakavatara VI, 58) This logical flaw has been dealt with previously. If something is factually existent, already produced, the idea of its condition is simply pointless.

Refutation of the four special conditions

Having, in this way, shown that conditions in general are inefficacious because of their inability to give rise to effects, Nagarjuna goes on to show the inefficacy of the types of conditions one by one.

Someone may object: Even though, in this sense, conditions are impossible, none the less, because its definition can be given, the idea of condition is commonly accepted. For example, the definition of condition as cause (hetu) (in 1 this is the first of the four kinds of condition given in kārikā 2) is that it brings forth something. But to give the definition of something non-existent, like the son of a barren woman, does not make sense.

We reply: There would be condition as cause if it had a definable nature (laksanam). So:

KALUPAHANA COMMENTARY

Here the condition (pratyaya) is examined in relation to the effect (artha). Even though the criticism up to now has been directed on the metaphysical notion of a substantial condition, and not on a pragmatic definition understood in relation to the effect, the present verse is intended to clarify the nature of the effect. The question is: In terms of what kind of effect should a condition be defined? An existent effect or a non-existent effect? An effect existent in terms of self-nature needs no support for its arising and, as such, a condition would be meaningless. An effect that is non-existent in the sense of being absolutely different from the condition will not be related in any way to a condition.

GARFIELD COMMENTARY

6. He notes here that if entities are conceived as inherently existent, they exist independently and, hence, need no conditions for their production. Indeed, they could not be produced if they exist in this way. On the other hand, if things exist in no way whatsoever, it follows trivially that they have no conditions. (fn 30. See Bhattacharya (1979), esp. pp. 336-37, for a good discussion of this argument.) The following three verses make this point with regard to each of the four kinds of conditions:
Kārikā I.7

na san nāsan na sad asan dharma nirvartate yadā |
kathāṃ nirvartako hetur evaṃ sati hi yujyate ||7||

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 7 - When a factor of experience does not evolve from being, non-being, nor from both being and non-being, how can there be an effectuating cause? Thus (such) a cause is not permissible. - Note: This verse treats the concept of the primary causal condition (hetu-pratyaya)

JONES (Skt):
[7] So too, when no existing, nonexisting, or existing-and-nonexisting basic phenomena are produced, how is a cause admitted?

KALUPAHANA (Skt):
Since a thing that is existent or non-existent or both existent and non-existent is not produced, how pertinent in that context would a producing cause be?

MCCAGNEY (Skt):
Whenever an event that is existent, nonexistent, or both existent and nonexistent does not originate, how can a cause that thus brings [events] about be reasonable?

NISHIJIMA (Skt?):
7. When a person, who acts, is criticized,
A problem of the Real Action to do, does not appear actually to be the special object discussed at all.
If there were no chance for everyone to do anything at all, it might be very happy,
But where is it possible for anyone to have such a happy condition, even anywhere at all?

SPRUNG (Skt):
7. As no putative element of existence, whether existent, non-existent or both is brought forth, how can it make sense that a cause brings something forth?

STCHERBATSKY (Skt):
VII. Neither an Ens nor a non-Ens, Nor any Ens-non-Ens, No element is really turned out. How can we then assume The possibility of a producing cause?

ROBINSON (Skt):
When neither an existing nor a non-existing nor an existing-and-non-existing dharma generates, how can it be valid, this being so, that [there is] a generating cause?

BOCKING (Ch):
1v9 If neither an existent effect is produced - Nor an inexistent one is produced, Nor an existent–and–inexistent one is produced How can you say that there are causes?

BATCHelor (Tb):
When things cannot be established as either existent, non-existent or both, how can one speak of an “establishing cause.” Such would be impossible.

DOCTOR (Tb):
If no existent, nonexistent, or both existent and nonexistent Phenomenon comes into being, How can we speak of “effectuating conditions”? When this is the case, they do not make sense. [I.7]

GARFIELD (Tb):
7. When neither existents nor Non-existents nor non-existent non-existents are established, How could one propose a "productive cause?" If there were one, it would be pointless.

GARFIELD-SAMTEN (Tb):
7. When phenomena are established Neither as existent, nor nonexistent, nor as both, How could one propose a cause for a thing’s existence? In this case, it would make no sense.

HAGEN (paraphrase):
Since effects that exist (or don’t exist, or both exist and don’t exist) are not produced, what sense does it make to speak of what causes them?
PINGALA COMMENTARY

1/9 If causes could produce effects, then these would be of three kinds: either existent, or inexistent, or both existent-and-inexistent. As was argued in the previous verse, if the effect were already existent within its cause, then we could not say that it was produced, because it existed already, and if the effect were previously non-existent, then we could not say that it had been produced, since it did not exist, and because it would be similarly uncaused. As to 'existent-and-inexistent' effects being likewise not produced; 'existent--and--inexistent' means half existent and half inexistent, yet to speak of both at once is wrong. Moreover, existence is the opposite of inexistence, and inexistence is the opposite of existence; how could there be one dharma with two characteristics? Since these three ways of seeking for the characteristic of to producer of an effect' lead nowhere, how can you assert that there are "causal conditions"? As to the 'sequential condition';

CANDRAKĪRTI COMMENTARY

Here ‘to bring forth’ means to produce. If the element of existence (dharmā) which is to be brought forth were really brought forth the producing cause would ‘produce’ it. But it does not come forth: nothing, whether existent, non-existent or both, is brought forth. Nothing existent is brought forth, because it is in existence; nothing non-existent is brought forth because it is not in existence; nor anything both existent and non-existent, because no one thing has mutually contradictory attributes and because of the faults of each view already given. So, as no effect is produced, there is in consequence no cause. Therefore the claim that cause must be factual because its definition can be given does not make sense.

Now, with a view to refuting condition as the objective basis (alambana) Nagarjuna says:

KALUPAHANA COMMENTARY

This is an examination of the first of the four conditions referred to in I.2, namely, a primary condition (hetupratyaya).

After examining the nature of a condition (pratyaya) and the effect (arthā) or the causally arisen phenomena (pratityasamutpāna dharmā), in this and the next three verses Nagarjuna is directing his attention to the four specific conditions formulated by the Abhidharmikas.

In defining the primary condition, the Abhidharma refers to five of the six causes (hetu)(AK 2.6.1). They are (1) a "co-operative cause" (sahabhu-hetu) or factors that work together in producing another; (2) the "complementary cause" (sabhaga-hetu), which is a cause helping other causes of its kind; (3) the "associated cause" (samprayuktaka-hetu); (4) the "all pervading cause" (sarvatrage-hetu) and (5) the "fruitioning cause" (vipaka-hetu). However, the interpreters of the Abhidharma defined a primary condition (hetu-pratyaya) as a producing (nirvartaka) or a root cause (mulathena hetu upakarakatthena paccayo, Vism). Nagarjuna, in the hope of clarifying the implications of this definition, raises the question as to whether this condition is supposed to give rise to an existent (sat) phenomena or a non-existent (asat) phenomena or something that is both existent and nonexistent (sad asat). The early Abhidharmikas do not seem to have involved themselves in such speculations regarding the absolute identity or absolute difference between a condition and its effect; hence this criticism of Nagarjuna applies only to the later interpreters of the Abhidharma conception of a primary condition.

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 8 - It is said that a true factor of experience does not have an appropriating or objectively extending relational condition. If it does not exist, then again, wherein is this type of relational condition?

JONES (Skt):
[8] Something real is shown to be unsupported by another real thing. When a thing exists without such a support, what purpose would an objective support serve?

KALUPAHANA (Skt):
A thing that exists is indicated as being without objective support. When a thing is without objective support, for what purpose is an objective support?

MCCAGNEY (Skt):
This event that exists is described as without a supporting condition.
But where an event is without a supporting condition, again, why [talk of] a supporting condition?

NISHIJIMA (Skt?):
8. Just the hanging world is this world, Therefore the Real Universe has been shown already. Just in the hanging world, or in the Universe, Where is it necessary for us to find the hanging world again?

SPRUNG (Skt):
8 An existing mental content is, as such, held to be without an objective basis. If it exists without an objective basis, why would there be an objective basis subsequently?

STICHERBATSKY (Skt):
VIII. A mental Ens is reckoned as an element, Separately from its objective (counterpart). Now, if it (begins) by having no objective counterpart. How can it get one afterwards?

BOCKING (Ch):
1v10 Where an effect has not yet arisen There cannot have been cessation. Yet how can a ceased dharma be a cause? Therefore there is no 'sequential cause'.

BATCHelor (Tb):
An existent phenomenon is clearly said to have no object at all. If the phenomenon has no object, where can the object exist?

DOCTOR (Tb):
It is explained that, with existent phenomena, There are no observations whatsoever. How could a phenomenon for which there is no observation Ever relate to an observation? [I.8]

GARFIELD (Tb):
8. An existent entity (mental episode) Has no object.
Since a mental episode is without an object, How could there be any percept-condition?

GARFIELD-SAMTEN (Tb):
8. You have stated emphatically that it is not the case that An existent phenomenon has any object at all. So since phenomena are without objects, How could there be an objective condition?

HAGEN (paraphrase):
To exist is to be without need of an other. When one thing can exist without another, what purpose would the other serve?
ROBINSON (Ch):
As all-the Buddha what speak true real subtle marvelous dharma, in this inexist condition dharma, say how exist condition condition? [Verse 9 of the Chinese]

ROBINSON (Ch - Remarks):
Chu fo 諸佛 (all the Buddhas) is added by the translators.
Chen-shih wei-miao fa 真實微妙法 (real, exquisite Dharma) is redundant by three characters in order to fill out the line. Kumarajiva seems to have read saddharma (True Dharma), thus making the verse a scriptural allusion. The Prasannapada text is faulty here, and La Vallee Poussin supplies san dharma with the note, "Mss. sa dharma, sarvadharma.” Kumarajiva’s reading may be preferable.

INADA FOOTNOTE
Note: Alambana is normally translated as the object of cognition but here it hardly seems applicable to the concept of dharma (factor of experience).

PINGALA COMMENTARY

1/10 All the dharmas of thoughts and mental configurations are produced consecutively in the three periods of time. The cessation of the dharma of a present thought or mental configuration constitutes the sequential cause for a future thought. Yet for what does it constitute a sequential cause if the future dharma has not yet been produced? And if that future dharma is already existent, it is already produced, so what use does it have for a sequential cause?

There is no time when the dharmas of present thoughts and mental configurations are at rest. If they are never at rest, how can they act as sequential causes? If they were at rest, then they would be inactive dharmas. Why is this? Because active dharmas always have the characteristics of cessation. If they have ceased, they cannot act as sequential causes. If you say that a ceased dharma still exists, then this implies permanence, but if there is permanence then there can be no sin and merit, and so forth. If you hold that the moment of cessation can act as a sequential cause, then the moment of cessation must be half ceased and half not-yet-ceased. Apart from these there is no third dharma to be called the moment of cessation. Moreover the Buddha has taught that "all active dharmas cease in successive instants. There is not one single instant when they abide", so how can you say that a present dharma is both on the point of cessation and not on the point of cessation? If you assert that one instant does not include this on the point of cessation and not on the point of cessation, you deny your own dharma. Your Abhidharmist speaks of a dharma of cessation, a dharma of non-cessation, a dharma of on the point of cessation and a dharma of not on the point of cessation. The dharma of the point of cessation includes present dharmas which are about to cease; the dharma of not on the point of cessation includes, with the exception of present dharmas which are about to cease, the remaining present dharmas plus past, future and inactive dharmas; these are termed not on the point of cessation dharmas. reasons there are no 'sequential causes'.

As to the 'objective cause'.

CANDRAKĪRTI COMMENTARY

Which mental contents (dharma) are held to be dependent on an objective basis? (fn 2 In the opponent's view.) According to scripture all the contents of consciousness (cittacaitta) are. Whatever objective cause - colour or other sense object — produces the contents of consciousness that is their objective basis. It must be thought of as the cause of either existing or of non-existing mental content. In the first case there need be no objective cause of mental contents which exist; indeed the objective cause is conceived in order to explain the arising of mental content; this exists in fact prior to there being an objective cause. The contents of consciousness being thus established as independent and without objective cause, why would a connection with an objective cause be supposed? Consciousness and its contents exist factually without objective causes. To say they have objective causes is the merest caprice, for there is no connection whatsoever between them and objective causes. (fn 3 The Madhyamika view is rather that objective cause and mental content are interdependent and singly unintelligible.)

Second, an objective cause of a non-existing content of consciousness is imagined, which makes equally little sense. 'Mental content is, as such, without an objective basis’, as the kārikā says. There can be no conjunction of non-existing mental content with an objective cause.
‘An existing mental content is, as such, held to be without an objective basis.’ Our opponent would have to substitute the phrase ‘with objective basis’. If a mental content exists without an objective basis, why would there be an objective basis subsequently?’ This is a question which gives the explanation. The meaning then becomes: If, thus, a mental content is without an objective basis, it is factually non-existent; how can it then have an objective cause? The thought is that because what justifies the objective cause does not exist, the objective cause itself cannot exist.

But in what sense do the contents of consciousness have objective causes? This is a characterization which holds for the delusive everyday world, but not for the higher truth; so it is not to be faulted.

And now Nagarjuna refutes the idea of condition as the ‘immediately preceding condition’.

**KALUPAHANA COMMENTARY**

The Abhidharma defines the objectively supporting condition as all "phenomena" (sarvadharmah) (AK 2.61). It was intended to explain the occurrence of all ideas of experience. Buddhism recognized external objects as conditions for the arising of ideas of experience (in contrast to the ideas of imagination). For example, it is admitted that "depending upon eye and visible form arises visual consciousness" (cakkhun ca paticca rupe ca uppajjati cakkhuvinnam, M 1.111-112), and these serve as conditions for the ideas of perceptual experience.

During the Abhidharma period these various conditions as well as the ideas of experience came to be categorized into mind (citta), mental concomitants (caitta, cetasika), and material form (rupa), even though they were not sharply distinguished into substantially different entities as mind and matter. Yet those who defined these categories ultimately ended up recognizing mental substances and material substances, the mental substances have the capacity to perceive their own mental concomitants (caitta), even though these concomitants are conditioned by materially constituted objects. The mental substances thus became the subject, the mental concomitants the contents of perception and the material form the objective condition. Such speculation not only led to the belief in a cogito, thinking of its own subject-matter (caitta) carrying with it all the metaphysical implications, but also raised the question as to the need for an external object (alambana) as a support for the concomitants. While the question regarding the cogito is taken up by Nagarjuna in Chapter III, the need for an external objective support is raised in the present verse.

Thus, it is recognized by Candrakīrti that the question regarding objective support is raised by Nagarjuna because those whose views he was criticizing admitted a cogito (athaivam analambane dharme svatmana prasiddhe kim asyalambanayogena parikalpitena, (P) 84; (V) 29) This is similar to the refutation of a “material object” by the Western philosopher George Berkeley. If the object appears to the perceiving mind in its own form (i.e. in the form of a mental impression) (svatmana prasiddhe), there is no need for an objective support (alambana). If it does not appear to be the perceiving mind in its own form, it will never be perceived, since the perceiving mind and the material object are of completely different natures (paratman?). This is indeed not a rejection of the notion of an objective support (alambana-pratyaya) per se, but an object that is conceptualized in a metaphysical way, that is, as an object constituted of a material substance distinguished from a mental substance.

**GARFIELD COMMENTARY**

8. (8. “An existent entity (mental episode)” – fn: 31. The Tibetan is literally “yod pa’j chos, “ or existent entity. But as both Tsong Khapa (pp. 31-32) and dGe·’du n-grub (p. 12) argue, the entity in question can only be a mental episode.)

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 9 - It is not possible to have extinction where factors of experience have not yet arisen. In an extinguished state, for what use is a relational condition? Thus the sequential or contiguous relational condition is not applicable.

JONES (Skt):
[9] When basic phenomena have not arisen first, cessation does not occur. Thus, the condition of “continuity” is not applicable. And when the reality has ceased, what condition applies?

KALUPAHANA (Skt):
When things are not arisen [from conditions], cessation is not appropriate. When [a thing has] ceased, what is [it that serves as] a condition? Therefore, an immediate condition is not proper.

MCCAGNEY (Skt):
When events do not arise, cessation does not happen. Hence what condition is suitable for a noncontiguous condition in cessation?

NISHIJIMA (Skt?):
9. In the Universe, which has not been accomplished yet, The self-regulation does never appear actually at all. The ceaseless considerations can never be any kind of fetters for us at all. The Real Truth in our self-regulation might be just something ineffable.

SPRUNG (Skt):
9. The coming to an end of elements of existence which have never arisen is not logically possible. Hence the immediately preceding condition makes no sense: how could what has come to an end be a condition indeed?

STCHERBATSKY (Skt):
IX. If (separate) elements do not exist.
Nor is it possible for them to disappear.
The moment which immediately precedes Is thus impossible. And if ‘tis gone,
How can it be a cause?

ROBINSON (Skt):
When dharmas have not arisen, cessation is not a fact. And what condition is there in the ceased? Hence the immediate [preceding condition] is not valid.

BOCKING (Ch):
1v11 According to the true and subtle Dharma Taught by all the Buddhas,
In this Dharma without causes
How can there be objective causes?

BATCHELOR (Tb):
If phenomena are not born, it is invalid for there to be cessation. Therefore, an immediate [condition] is unreasonable. What, having ceased, can also be a condition?

DOCTOR (Tb):
If phenomena have not arisen,
Cessation makes no sense.
Hence, an immediately preceding condition is untenable.
If it has ceased, how could it be a condition? [I.9]

GARFIELD (Tb):
9. Since things are not arisen,
Cessation is not acceptable.
Therefore, an immediate condition is not reasonable.
If something has ceased, how could it be a condition?

GARFIELD-SAMTEN (Tb):
9. Since phenomena are not arisen,
Cessation is not tenable.
Therefore an immediate condition makes no sense.
If something has ceased, how could it be a condition?
HAGEN (paraphrase):
When a thing doesn't appear, it can't cease to appear.
When a thing ceases to appear, how can it be conditional? It doesn't exist.

ROBINSON (Ch):
Effect when not-yet arise time, then not ought exist cease.
Cease dharma how able condition? Reason inexist next number condition. [Verse 8 of the Chinese]

ROBINSON (Ch - Remarks):
Jo… shin 若…時 (when … time) renders the locative absolute. Pu ying yu 不應有 (not ought exist) stands for nopapadayate (is not a fact, is not true to fact). Wu 無 (inexist) stands for na yuktam (it is not valid). In the Sanskrit text the third and fourth padus are reversed. As Candrakīrti says: "tenaivam pathah—niruddhe ca pratayyah kah, nanantaram ato yuktam iti." My translation and the Chinese both follow this principle, the Chinese thus confirming Candrakīrti.

PINGALA COMMENTARY

1/11 For these The Buddha teaches in the Mahayana that the characteristics of dharmas – whether they have form or do not have form, whether they have shape or do not have shape, whether they have outflows or do not have outflows, whether they are active or inactive, and so forth – all these characteristics enter into the Dharma–nature; 0 everything is entirely empty and so there are no characteristics and no conditions. It is just as if everything flowed into an ocean and merged into one essence. You may believe in the true Dharma, but what is taught as an expedient does not constitute true reality. Therefore there are no objective causes.

As to the 'predominant cause':

CANDRAKĪRTI COMMENTARY

In the last sentence of this kārikā the two halves should be transposed; and the word ‘indeed’ should precede ‘come to an end’. The sentence would then be, ‘If something has indeed come to an end, how can it be a condition? The immediately preceding condition makes no sense.’ It was put the other way for the purposes of verse structure.

In this argument the definition of the immediately preceding condition (anantara) is this: the immediately preceding cessation of the cause is the condition of the effect arising (fn 4 Existence is conceived as a series of discrete moments, each perishing before the next arises, yet each being, as it were, the material cause of its successor.). This should be examined. If elements of existence in the form of effects, for example a sprout, do not in fact arise, it is not logically possible that their ‘cause’, for example a seed, could cease to exist. There being, in this way, no cessation of a cause, what could be the immediately preceding condition of the sprout? Perhaps it is held that the seed ceases to exist before the effect arises. If this is so, when the seed has ceased to exist, is nonexistent, what will be the cause of the sprout? Or what will be the cause of the extinction of the seed? Both are without cause; as Nagajjuna put it: ‘If something has indeed come to an end how will it be a condition?’ The word ‘indeed’ refers back to the phrase ‘which have never arisen’. It follows that if the sprout does not come into existence because the seed and the other factors are considered to have ceased to exist, it must be that both (fn 5 i.e. the extinction of the seed and the arisal of the sprout) are without cause. The ‘immediately preceding condition’ does not make sense.

Or it might be that Nagarjuna had in mind the general rejection of causation of the first kārikā when he said, ‘The coming to an end of elements of existence which have never arisen is not logically possible. Hence the immediately preceding condition makes no sense.’ The remaining part: ‘How could what has come to an end be a cause indeed?’ can be explained exactly as before.

And now Nagarjuna, with a view to refuting, independently, the idea of condition as ‘decisive factor’ says:

KALUPAHANA COMMENTARY

The immediately contiguous condition (samanantarapratyaya) was first formulated by the Abhidharmikas in order to account for certain kinds of relations implied in the Buddha’s statements such as: "In this way, monks there is the immediate (anantara) waning of defilements," (S 3.58). The Abhidharmikas, therefore, specified the relation as one among mind and mental concomitants (cittacaita acarama uppannah samanantararah, AK 2.62). With the acceptance of
a theory of moments (ksana), the interpreters of the Abhidharma were faced with several questions: Does this relation obtain among events of a similar nature (svajati)? How can the emergence of dissimilar events be explained? (Akb p). The problems are not different from those that are associated with the conception of a series (similar to the problems faced by empiricists like David Hume). The question as to how one momentary event can give rise to another or how one series could pave the way for a different series was discussed, in relation to the problem of knowledge, especially the knowledge of the future. Some of the interpreters of the Adhidharma recognized an unimaginable range of comprehension on the part of the Buddha (acintyo hi buddhanam buddhavisaya iti, Akb), which was probably a view advocated by the Sarvastivadins, who admitted the possibility of knowing the existence of everything (sarvam asti) belonging to the past, the present and the future. The Sautrantikas, who refused to accept such a position, maintained that the Buddha follows 'signs' (naimittako) and that even in the absence of direct perception of future events (na saksatkarī) he is able to predict them on the basis of "intention" (icchamatrena, ibid.).

Nagarjuna, realizing the difficulties inherent in such speculations, raises questions regarding the very conception of 'arising' in such a context. Neither the momentary events, nor the substances that were posited to account for the continuity of series of such events, according to Nagarjuna, can be described as "arisen" (utpanna). If they are not arisen (anutpanna), their cessation is also inconceivable. If they were to cease momentarily, they could not serve as conditions (pratyaya).

**GARFIELD COMMENTARY**

9. In I:7, Nāgārjuna is reasoning that since an inherently existent phenomenon is by definition independent, it could not have been produced by anything else. An inherently nonexistent phenomenon certainly cannot be produced; if it were, it would be existent. An existent nonexistent (for instance, something posited by a Meinongian ontology - existing in a logical space, though not in the actual world) cannot be produced since its actual production would contradict its existence and its production in some other way would contradict the inherent existence of the other sort posited for it.

The argument in I:8 is a bit different and is directed more specifically at the special, status of simultaneous supporting conditions, such as those posited in perception, as discussed above. Nāgārjuna is making the following point: If we consider a particular moment of perception, the object of that perceptual episode no longer exists. This is so simply because of the mundane fact that the chain of events responsible for the arising of perceptual consciousness takes time. So the tree of which I am perceptually aware now is a tree that existed about one hundred milliseconds ago; not one that exists now. The light took some time to reach my eye; the nerve impulses from the eye to the brain took some time; visual processing took still more time. So if the story about how the tree is the percept-object condition of my perception according to which the tree exists simultaneously with the perception and exerts a causal power on my eye or visual consciousness were accepted, perception would be impossible. Moreover, the objects of many mental episodes are themselves nonexistent (like the golden mountain). But non-existents can’t be causally responsible for anything.

Verse 9 contains two arguments. In the first half of the verse, Nāgārjuna is offering a quick reductio on the idea that immediately preceding conditions can exist inherently. By definition, an immediately preceding condition is a momentary element of a causal chain. And, by definition, something that is inherently existent is independent; hence, it cannot arise depending on something else and, therefore, cannot cease to exist. But immediately preceding conditions must arise and cease. In the final line of the verse, Nāgārjuna develops a related problem. Immediately preceding conditions must cease before their effect arises. If their existence and exertion of causal power is what explains the arising of the cause, the arising of the cause is then inexplicable. (This argument is also used by Sextus Empiricus in Against the Logicians.)

What is important about this strand of the argument? Nāgārjuna is drawing attention to the connection between a causal power view of causation and an essentialist view of phenomena on the one hand, and between a condition view of dependent arising and a conventional view of phenomena on the other. If one views phenomena as having and as emerging from casual powers, one views them as having essences and as being connected to the essences of other phenomena. This, Nāgārjuna suggests, is ultimately incoherent since it forces one at the same time to assert the inherent existence of these things, in virtue of their essential identity, and to assert their dependence and productive character, in virtue of their causal history and power. But such dependence and relational character, he suggests, is incompatible with their inherent existence. If, on the other hand, one regards things as dependent merely on conditions, one regards them as without essence and without power. And to regard something as without essence and without power is to regard it as merely conventionally existent. And this is to regard it as existing dependently. This provides a coherent mundane understanding of phenomena as an alternative to the metaphysics of reification that Nāgārjuna criticizes. Verse 10 is central in this discussion:
bhāvānāṃ niḥsvabhāvānāṃ na sattā vidyate yatab | 

satīdam asmin bhavatīty etan naivopapadyate ||10|| 

zhū fǎ wú zì xìng gǔ wú yǒu yòu xiāngxiāng 
shuí yǒu shì shì gù shì shì yōu bū rán 
| dños po rañ bźin med mams kyi | | yod pa gaṅ phyir yod min na | 
| ’di yod pas na ’di ’byuṅ žes | | bya ba ’di ni ’thad ma yin | 

**ENGLISH TRANSLATIONS**

INADA (Skt):
Verse 10 - As entities without self-nature have no real status of existence, the statement, "from the existence of that this becomes," is not possible.

JONES (Skt):
[10] Since the existence of entities without self-existence is not found, we cannot say "This reality existing, that one comes to be."

KALUPAHANA (Skt):
Since the existence of existents devoid of self-nature is not evident, the statement: "When that exists, this comes to be," will not be appropriate.

MCCAGNEY (Skt):
Since beings lacking self-nature do not occur as existence per se, this [statement] "when that is, this comes to be" does not obtain.

NISHIJIMA (Skt?):
10. All existences themselves originally do not have any characteristics, the facts of existences are never recognized as something ordered. And even though there is an idea that this world is existing relying upon the world itself, such situations of the real world can never be seen like that at all.

SPRUNG (Skt):
10 Things lacking in self-existence are never real; therefore the principle (in The earliest formulation of the Buddhist conception of ‘causality;’ it is attributed to the Buddha.) ‘this being, that becomes’ is not intelligible in any way.

STCHERBATSKY (Skt):
X. If entities are relative, they have no real existence. The (formula) "this being, that appears" then loses every meaning.

ROBINSON (Skt):
As realness does not occur for existents that lack own-being, that ‘this being, that becomes’ is not a fact, either.

BOCKING (Ch):
1v12 Since dharmas do not have self nature the characteristic of existence does not occur to assert 'because this things exists that thing exists' is not correct.

BATCHelor (Tb):
Because the existence of essence-less things does not exist, it is incorrect to say: "When this exists, that arises."

DOCTOR (Tb):
Since there is no existence of things that have no nature, saying, "this occurs because of that" would not make any sense. [I.10]

GARFIELD (Tb):
10. If things did not exist without essence, the phrase, "When this exists so this will be," would not be acceptable.

GARFIELD-SAMTEN (Tb):
10. Since there is no existence of essenceless things, the statement "When this exists, this will arise" is not tenable.

HAGEN (paraphrase):
Since things devoid of self-nature do not exist, to say "when this is, that becomes" does not make sense.

ROBINSON (Ch):
All the dharmas have no own nature, reason no exist exist mark. Speak ‘exist this fact reason, this fact exist’ not so.
ROBINSON (Ch - Remarks): *Yu hsiang* 有相 (exist mark) translates *satta* (realness, being, the fact of being). This use of *hsiang* 相 (mark) to represent the abstract noun suffixes -*tva* and -*ta* is fairly common in Kumarajiva's works. *Wu yu* 無有 (has no existence) renders *na vidyate* (is not found, does not occur). *Pu jan* 不然 (is not so, is not true) renders *nopapa-dyate* (is not a fact, is not true to fact).

**INADA FOOTNOTE**

Note: This verse treats the concept of the dominantly extending relational conditional (adhipati-pratyaya).

Stecherbskly interprets the Sankrit phrase, *satidam asmin bhavati*, as the formula for the twelve-fold causal chain as found in the Nikayas. However, Ryotai Hatani points out as a note to this particular verse that the phrase is not to be restricted to the general formula on causation but should simply mean the significance of the existence of one entity from another. To be operative, the fourth cause (adhipati-pratyaya) must assume the existence of an entity. However, Nagarjuna's fundamental standpoint is that of the non-self-nature (nihsvabhava) of an entity and therefore rules out any imputation of a causal or relational connection of entities in a one-to-one manner.

**PINGALA COMMENTARY**

1/12 In relation to the sutras' teaching of the twelve causal links, to say that 'because this thing exists, therefore that thing exists', is wrong, and why? Because dharmas are produced from causes and do not have a fixed nature of their own. Since they have no fixed nature of their own, they do not have the characteristic of 'existence'. Where the characteristic of existence does not exist, how can you say 'this thing exists, therefore that thing exist. *s*'? Therefore, there is no predominant cause. It was only in accordance with the distinction made by ordinary people between existence and nonexistence that the Buddha spoke of them.

Further,

**CANDRAKĪRTI COMMENTARY**

The definition of condition as 'decisive factor' (*adhipateyam*) assumed here is this: a factor which, on being present, something arises, is the decisive factor of the latter. But as nothing is self-existent, all things arising in mutual dependence, how can the ‘this’ be represented as a cause (*karanatva*)? And how can the ‘that’ be represented as an effect (*karyatva*)? So, though ‘decisive factor’ is defined, it has not been established.

*Final repudiation of condition, origination and effect*

Someone may object: Having seen that cloth and such things are made of threads and so on it is said that threads are the condition of the cloth. We reply: But cloth and such things do not emerge truly as self-existent effects; how will the causal efficacy (*pratyayatva*) of conditions be established?

In what sense there is no emergence of cloth and such things as effects Nagarjuna expounds in this way:

**KALUPAHANA COMMENTARY**

The notion of dominance was understood in a very general and broad way in the early discourses. For example, oneself (attā), the world (loka), and righteousness (dhamma) were considered dominant conditions (adhipateyya) in the matter of refining one's moral life (A 1.147-150). The Abhidharmikas defined the dominant condition as an active cause (karana-hetu) and this differed from the other five causes (see note on I.7) because of the dominant effect of this cause. Dominance, of course, can be of different sorts. For example, a seed may be a dominant cause of the sprout, just as much as water is. The Abhidharmikas reserved the notion of dominant condition (or active cause) to explain the latter kind of relationship, namely, that between water and the sprout. Hence it was defined as something "other than itself" (svato 'nye, AK 2.50). However, this distinction between self and other came to be "reified" to such an extreme that the later interpreters of the Abhidharma were left with the notions of serf-nature (svabhava) and other-nature (parabhava). It became almost impossible to speak of 'this' and 'that' without getting involved in a discussion of self-nature and other-nature. Therefore, when the Buddha's formulation of the general causal principle as: "When that exists, this comes to be," (asmin satidam bhavati) came up for discussion, the metaphysicians were quick to interpret sat (occurring in the locative absolute construction asmin sati)
as substantial existence of the two entities referred to by asmin (that) and idam (this).

Here too Candrakīrti, in spite of his leanings towards "no views," presents dependent arising as a position from which to criticize serf-nature or self-existence (svabhava). He argues: "Because existents are dependently arisen and, therefore, without self-nature, how can that statement: ‘Because existents are dependently arisen and, therefore, without self-nature, how can that statement: ‘When that (exists),’ be intended as an active cause?’"

(Bhavanam pratityasamutpannatvat svabhavabhave kutas tad yad asminn iti karanatvena vyapadisyate, (P) 87; (V) 30). Nagarjuna’s criticism, therefore, leaves the Buddha’s general formula of causation untouched, for it was not the Buddha’s intention to reify either "this" or "that."

GARFIELD COMMENTARY

10. Nāgārjuna is replying here to the causal realist’s inference from the reality of causal powers to their embodiment in real entities whose essences include those powers. He turns the tables on the realist, arguing that it is precisely because there is no such reality to things - and hence no entities to serve as the bearers of the causal powers the realist wants to posit - that the Buddhist formula expressing the truth of dependent arising (fn 32. A formula familiar in the suttas of the Pali canon.) can be asserted. It could not be asserted if in fact there were real entities. For if they were real in the sense important for the realist, they would be independent. So if the formula were interpreted in this context as pointing to any causal power, it would be false. It can only be interpreted, it would follow, as a formula expressing the regularity of nature. (fn 33. This verse is very often translated and interpreted in a diametrically opposed way: “Since things exist without essence the assertion, ‘When this exists, this will be’ is not acceptable.” Readings like this are to be found in Inada (1970), Streng (1967), Sprung (1979), and Kalupahana (1986). They may be suggested by Candrakīrti’s comments to the effect that this phrase would make no sense were it asserted by the realist. But such a translation is not supported by the dialectical structure of the chapter and forces an excessively negative interpretation on the chapter as a whole. Moreover, as we shall see in Chapter XXIV, this would entail an untenable absolutism with respect to the ultimate truth and a corresponding untenable nihilism with respect to the conventional world. But see Nagao (1989) for a better reading: The meaning of the traditional expressions “dependent upon this,” or “if this exists then that exists” is not that when one essence exists, then some other essence exists apart from it. On the contrary, it is because both this and that do not exist as essences that, when this exists, then that also exists. (p. 7)) In the next three verses (I: 11-13), Nāgārjuna anticipates and answers the causal realist’s reply:
**Kārikā I.11**

na ca vyastasamasteṣu pratyayeṣv asti tat phalam |
pratyayebhyah kathāṃ tac ca bhaven na pratyayeṣu yat ||11||

chāṅg guāng yīn yuán zhōng qiú guǒ bù kē dé;dei;dei yīn yuán zhōng ruò wú yún hé cóng yuán chū

| rkyen mams so so ’ dus pa la | | ’bras bu de ni med pa ŋid | | rkyen (5) nams la ni gaṅ med pa | | de ni rkyen las ji ltar skye |

**ENGLISH TRANSLATIONS**

INADA (Skt):
Verse 11 - The effect (i.e., arisen entity) does not exist separated from relational condition nor together in relational condition. If it does not exist in either situation, how could it arise out of relational conditions?

JONES (Skt):
[11] An effect does not exist in conditions that are either separate or combined. And how can what does not exist in the conditions come from those conditions?

KALUPAHANA (Skt):
The effect does not exist in the conditions that are separated or combined. Therefore, how can that which is not found in the conditions come to be from the conditions?

MCCAGNEY (Skt):
The effect is not in the conditions either separately or together. How could that which is not in the conditions be from the conditions?

NISHIJIMA (Skt?):
11. Never being scattered from each other, or accumulated together,
Because of the Real Truth, a concrete result does exist really. But how is it possible for the result to be, relying upon the True Reality.
However in that case the result is never expected because of relying upon such miscellaneous Real Truths.

SPRUNG (Skt):
11 The effect is not in its conditions, either singly or collectively; how could something which was not in conditions emerge from them?

STCHERBATSKY (Skt):
XI. Neither in any of the single causes
Nor in all of them together
Does the (supposed) result reside.
How can you out of them extract
What in them never did exist?

ROBINSON (Skt):
In the dispersed and the conjoined conditions there is not that effect. And how con that which is not in the conditions come into being from the conditions?

BOCKING (Ch):
1v13 In causes and conditions, whether summarized or at length,
You search in vain for an effect.
If an effect does not exist within conditions
How can you say that it issues from them?

BATCHelor (Tb):
There is no effect at all in the conditions individually or together. How can that which is not in the conditions itself be born from conditions?

DOCTOR (Tb):
In separate conditions and their gathering,
The effect is entirely absent.
How could something that does not exist in the conditions Ever arise from them? [I.11]

GARFIELD (Tb):
11. In the several or united conditions
The effect cannot be found.
How could something not in the conditions
Come from the conditions?

GARFIELD-SAMTEN (Tb):
11. The effect is neither in the several
Nor in the united conditions at all.
How could something not in the conditions
Arise from the conditions?

HAGEN (paraphrase):
Effects do not exist in the conditions in any way. How can what is not found in the conditions come from the conditions?
ROBINSON (Ch):
Brief expansive cause condition inside, seek effect not can get. Cause condition inside if inexist, say how from condition go-out?

ROBINSON (Ch - Remarks):
*Lueh-kuang* 略廣 (briefly and at length) mistranslates vyasta-samasta (separately and together). It looks as if Kumarajiva read the Sanskrit text aloud and an assistant picked the wrong equivalent out of a bilingual glossary. At any rate, Kumarajiva did not revise this verse carefully. The Middle Treatise commentary says: "Lueh—in the combined conditions there is no effect. Kuang—in the conditions [taken] one by one there is also no effect." If Kumarajiva understood this commentary, then he understood the verse. Yet neither he nor his assistants noted that vyasta-samasta here is not equivalent to Chinese *lueh-kuang*. This seems to be a striking instance of mechanical mistranslation. *Ch'u* 出 (go-out, come-out) renders bhavet (may be, would/could come into being).

PINGALA COMMENTARY

1/13 'Summarized' means; in the causes taken in combination there is no effect. 'At length' means; in the causes taken one by one there is likewise no effect. If there is no effect within the causes, whether taken in summary or at length, how can you say that effects issue from causes?

Further.

CANDRAKĪRTI COMMENTARY

In this case the cloth does not exist in any of the conditions taken singly, i.e. in the threads, the weaver's brush, the loom, the shuttle, the pins and so on, because it is not perceived in them and because from multiple causes, multiple effects would follow. Nor does the cloth exist in the threads and the other conditions taken collectively. As the effect as such is not present in any part, it would have to arise part by part. It follows from the absence of a self-existent effect that there can be no self-existent conditions.

KALUPAHANA COMMENTARY

Once again, the question raised in the second line: "How can that which is not found in the conditions come to be from the conditions?" is grounded on the assertion or premise mentioned in the first line. What is denied in the first line is that the effect is found in the causal conditions taken either separately or together. It does not mean a denial of the statement that the effect comes to be depending upon a condition or a group of conditions. In other words, it is a rejection of the essentialist method of looking for the effect even before it comes to be. A truly empiricist approach would not be concerned with such an enter-prize.

GARFIELD COMMENTARY

11. Here the realist argues that the conclusion Nāgārjuna draws from the unreality of causal power - the nonexistence of things (where "existence" is read "inherent existence") - entails the falsity of the claim that things dependently arise. For if there are no things, surely nothing arises. This charge has a double edge: If the argument is successful it not only shows that Nāgārjuna's own position is vacuous, but that it contradicts one of the most fundamental tenets of Buddhist philosophy - that all phenomena are dependently arisen. Moreover, the opponent charges, on Nāgārjuna's view that the explanandum is not to be found potentially in the explanans, there is no explanation of how the former is to be understood as depending upon the latter. As Nāgārjuna will emphasize in I: 14, however, the very structure of this charge contains the seeds of its reply. The very emptiness of the effect, an effect presupposed by the opponent to be nonempty, in fact follows from the emptiness of the conditions and of the relationship between conditions and effect. Nāgārjuna will, hence, reply to the opponent's attempted refutation by embracing the conclusion of his reductio together with the premises it supposedly refutes.
Kārikā I.12

INADA (Skt):
Verse 12 - Now then, if non-entity arises from these relational conditions, why is it not possible that the effect (i.e., arisen entity) cannot arise from non-relational conditions?

JONES (Skt):
[12] If the effect that develops from conditions does not exist in those conditions, why does it not develop without those conditions?

KALUPAHANA (Skt):
If that effect, being non-existent [in the conditions] were to proceed from the conditions, why does it not proceed from non-conditions?

MCCAGNEY (Skt):
Moreover, if the effect, nonexistent in those [conditions], is set in motion from those conditions, why is it not set in motion from no conditions?

NISHIJIMA (Skt?):
12. Actually there, something real, and even something concrete, Are going on following miscellaneous Real Truth itself. In the case relying upon the wrong Real Truth, all things and phenomenon will vanish, But it is perfectly impossible for result itself to go ahead at all.

SPRUNG (Skt):
12 If an effect which does not even exist can issue forth from its conditions, Why should an effect not issue forth from non-conditions?

STRENG (Skt):
12. Then the "non-real" would result from those conditioning-causes. Why then would a product not proceed also from non-causes?

STCHERBATSKY (Skt):
XII. Supposing from these causes does appear What never did exist in them, Out of non-causes then Why does it not appear?

ROBINSON (Skt):
Then [if] even though non-existing [in them] that [effect] proceeds from those conditions, why does the effect not proceed from non-conditions, too?

BOCKING (Ch):
1v14 If you maintain that causes have no effects And yet effects arise from within causes, Then why should these effects not Issue from non-causes?

BATCHelor (Tb):
If, although the effect is not there, it is born from those conditions, why is an effect not born from what are not its conditions?

DOCTOR (Tb):
If, without being present there, It were still to arise from conditions, Why would it not also arise From that which is not a condition? [I.12]

GARFIELD (Tb):
12. However, if a nonexistent effect Arises from these conditions, Why does it not arise From non-conditions?

GARFIELD-SAMTEN (Tb):
12. However, if without that, It arose from these conditions, Why does it not arise From that which is not a condition?

HAGEN (paraphrase):
If effects not found in the conditions were to come from the conditions, why wouldn’t they also come from non-conditions?

ROBINSON (Ch):
If think condition have-no effect, but from condition inside go-out, this effect why not from non condition inside this-way go-out?
ROBINSON (Ch - Remarks):

Wu 無 (inexist) stands for the participle asat (not being, non-existing). Kuo 果 (effect) is clearer than the pronoun tat (it, that) which it stands for.

PINGALA COMMENTARY

1/14 If you seek for effects within causes you cannot find them, so why should they not issue from non-causes? As an analogy, there is no jug in the clay, so why should one not issue from milk? Moreover:

CANDRAKĪRTI COMMENTARY

12ab If an effect which does not even exist can issue forth from its conditions

This would be the opinion of our opponent.

12cd Why should an effect not issue forth from non-conditions?

An effect cannot pre-exist in non-conditions either. Therefore cloth cannot issue forth from straw and other such non-conditions. No self-existent effect ever arises.

KALUPAHANA COMMENTARY

So far, most of the arguments were directed against self-causation and the substantial existence of the effect in the condition that gives rise to it. The present verse is a direct refutation of the view that the effect is different from the condition, that is, the basic premise of the theory of external causation. As implied by Nagarjuna, in such a context, the term "condition" loses its meaning, for if the cause and effect were sharply distinguished, one could maintain that anything can come out of anything. It is, in fact, the contrary of the substantialist view: "Nothing comes out of nothing."

GARFIELD COMMENTARY

12. How, the opponent asks, are we to distinguish coincidental sequence from causal consequence, or even from conventional dependence? And why don’t things simply arise randomly from events that are nonconditions since no special connection is posited to link consequents to their proper causal antecedents?
Kārikā I.13

phalāṃ ca pratyayamayaṃ pratyayāś cāsvayaṃmayāḥ |
phalam asvamayebhyo yat tat pratyayamayaṃ katham ||13||

**ENGLISH TRANSLATIONS**

**INADA (Skt):**
Verse 13 - The effect (i.e., arisen entity) has the relational condition but the relational conditions have no self-possessing (natures). How can an effect, arising from no self-possessing (natures), have the relational condition?

**JONES (Skt):**
[13] The effect is not constituted by its conditions. Conditions are not selfcreated. So how can an effect that arises from conditions that are themselves not self-created be created by those conditions?

**KALUPAHANA (Skt):**
The effect is made of conditions, but the conditions are themselves not self-made. How can that effect made of conditions [arise] from what is not self-made?

**MCCAGNEY (Skt):**
The effect is created by conditions, but the conditions are not created by themselves. How can an effect created by conditions be from what is not created by itself?

**NISHIJIMA (Skt?):**
13. Actually speaking, results are just enemies against the Real Truth.
And the Real Truths just hurts poor people.
Even though result has tendency to bring up poverty,
How is it possible for result to have the power to destroy the Real Truth absolutely?

**SPRUNG (Skt):**
13 If the effect consists of its conditions then the conditions are not, strictly speaking, conditions; if the effect arises from conditions which are not strictly conditions, how can it consist of conditions?

**STCHERBATSKY (Skt):**
XIII. The result is cause-possessor.
But causes are not even self-possessors.
How can result he cause-possessor,
If of non-self-possessors it be a result?

**ROBINSON (Skt):**
The effect is made out of the conditions, and the conditions are not made out of themselves. How can that effect which [emerges] from [conditions] that are not made out of themselves be made out of conditions?

**BOCKING (Ch):**
1v15 If effects arise from causes
And these causes have no self-nature,
Then effects arise from things which have no self-nature.
So how can they arise from causes?

**BATCHelor (Tb):**
Effects [are of] the nature of conditions. Conditions do not have own nature. How can those effects of what does not have own nature [be of] the nature of conditions?

**DOCTOR (Tb):**
The effect may be of its conditions' nature,
But these conditions have no nature of their own.
How could the effect of that which is not an entity itself
Be of the nature of that which conditions it? [I.13]

**GARFIELD (Tb):**
13. If the effect's essence is the conditions,
But the conditions don't have their own essence,
How could an effect whose essence is the conditions
Come from something that is essenceless?

**GARFIELD-SAMTEN (Tb):**
13. If the effect had the nature of the conditions,
The conditions would not have their own nature.
How could an effect of something without its own nature
Have the nature of conditions?

**HAGEN (paraphrase):**
If effects are conditional, but not the conditions themselves, how can what is conditional arise from what is not?
ROBINSON (Ch):
If effect from condition arise, this effect have-no own nature. From have-no own nature arise, how get from condition arise?

ROBINSON (Ch - Remarks):
The translation ts'ung yuan sheng 從緣生 (arise from condition/s) for pratyaya-mayam (consisting of conditions) obscures the concept of satkaryavada (inheritence of the effect in the cause) which Nagarjuna is attacking. Ho te 何得 (how get, how can) renders katham (how can). Wu tzu hsing 無自性 (no own nature) paraphrases asvamaya and asvayammaya (not made out of itself/themselves) obscurely but not incorrectly.

CANDRAKĪRTI COMMENTARY

It does not make sense to say that an effect consists of its conditions or is a mode of them, because these very conditions are not, strictly, conditions. That they are not self-existent conditions is what is meant. The opponent thinks that cloth consists only of threads. Cloth would consist only of threads if self-existent threads themselves were real. But they consist of small parts, are modifications of small parts; they are not real as self-existent. So, as the effect, which has the name ‘cloth’, arises from these small parts which have no self-nature and are not self-existent, how can it consist of threads?

It has been said: ‘Cloth is supposed to be realized from a cause and this cause from another cause; but how can what is not realized in its own right be the cause of something else?’

KALUPAHANA COMMENTARY

The first line of this verse contains two assertions. First of these is that "the effect is made of causal conditions" (phalam pratyayamayam), which is already negated at I.4 (kriya na pratyayavatī) where the term kriya is equivalent in meaning to the term phalam in the present context. So does the term pratyayavatī convey the same meaning as pratyayamayam. It is a statement asserting the identity between the condition and the effect. However, the next statement implies difference between the conditions that give rise to the effect and those other conditions that produce the conditions themselves, for the former are not "self-made" (asvayammayah). This, therefore, is a theory that attempts to accommodate both identity and difference in the causal process, and Nagarjuna sees this as a self-contradiction. It is indeed a refutation of the third theory of causation negated at I.1, namely, causation through both self and other (dvabhyam).

GARFIELD COMMENTARY

13. Finally, the opponent asks, since the phenomena we observe clearly have natures, and since those natures clearly derive from their causes, how could it be, as Nāgārjuna argues, that they proceed by means of a process with no essence, from conditions with no essence? Whence do the natures of actual existents arise? Nāgārjuna again will reply to this last charge by pointing out that since on his view the effects indeed have no essence, the opponent’s presupposition is ill-founded. This move also indicates a reply to the problem posed in I: 12. That problem is grounded in the mistaken view that a phenomenon’s lack of inherent existence entails that it, being nonexistent, could come into existence from nowhere. But “from nowhere,” for the opponent, means from something lacking inherent existence. And indeed, for Nāgārjuna, this is exactly the case: Effects lacking inherent existence depend precisely upon conditions that themselves lack inherent existence. Nāgārjuna’s summary of the import of this set of replies is terse and cryptic. But unpacking it with the aid of what has gone before provides an important key to understanding the doctrine of the emptiness of causation that is the burden of this chapter:
Kārikā I.14

Verse 14 - Consequently, the effect (i.e., arisen entity) is neither with relational nor without non-relational condition. Since the effect has no existing status, wherein are the relational and nonrelational conditions?

JONES (Skt):
[14] Therefore, an effect is not made either by conditions nor by nonconditions. But in the absence of an effect, where are conditions or nonconditions found?

KALUPAHANA (Skt):
An effect made either of conditions or of non-conditions is, therefore, not evident. Because of the absence of the effect, where could conditions or non-conditions be evident?

MCCAGNEY (Skt):
The effect is created neither from conditions nor from non conditions. How can an effect be obtained from nonexistent conditions and no conditions?

NISHIJIMA (Skt?):
14. Therefore result can never have any power to destroy the Real Truth at all. And at the same time result does never have any power to destroy wrong Real Truth at all.

When we have got from the synthetic point of view that result does never actually exist at all, Where can we find the Real World, which is constructed from the combination of Real Truth and wrong Real Truth together totally?

SPRUNG (Skt):
14 Therefore not as its conditions themselves, Nor does an effect exist as its non-conditions. As the effect is non-existent, how could there be either conditions or non-conditions?

STRENG (Skt):
14. Therefore, that product does not consist in those causes; yet it is agreed that a product does not consist of non-causes. How can there be a conditioning cause or non-cause when a product is not produced?

STCHERBATSKY (Skt):
XIV. There is, therefore, no cause-possessor, Nor is there an effect without a cause If altogether no effect arises, (How can we then distinguish) Between the causes and non-causes?

WESTERHOFF (Skt):
I.14b Because the effect is absent, where would conditions or non-conditions come from?

ROBINSON (Skt):
Therefore no effect occurs either made out of conditions or made out of non-conditions. Because of non-existence of the effect, how can conditions or non-conditions [exist]?

BOCKING (Ch):
1v16 Effects do not arise from causes And they do not arise from non-causes. Since the effects do not exist, Causes and non-causes likewise do not exist.

BATCHelor (Tb):
Therefore, [it does] not have the nature of conditions, nor is there an effect with the nature of non-conditions. Since there is no effect, what could [be its] non-conditions or conditions?

DOCTOR (Tb):
Hence, it is not of the nature of its conditions, Nor of the nature of that which are not its conditions. As there is no effect, how could there be Conditions as well as nonconditions? [I.14]

GARFIELD (Tb):
14. Therefore, neither with conditions as their essence, Nor with non-conditions as their essence are there any effects. If there are no such effects, How could conditions or non-conditions be evident?

GARFIELD-SAMTEN (Tb):
14. Therefore, effects have neither the nature of conditions, Nor the nature of non-conditions. If there are no such effects, How could there be conditions or nonconditions?
HAGEN (paraphrase):
Effects, either conditional or not, are not evident. If there are no such effects, where are either conditions or non-conditions evident?

ROBINSON (Ch):
Effect not from condition arise, not from non condition arise. Through effect no exist reason, condition non condition also inexist.

ROBINSON (Ch - Remarks):
Wu yu ku 無有故 (because . . . has no existence) translates the nominal -abhavat (because of the non-existence/absence of . . .). Wu 無 (inexists) in the last clause renders sam vidyate kutah (where/ how can it occur); a negative statement replaces an affirmative rhetorical question.

ROBINSON (Ch I Overall Conclusion Remarks)
To summarize the virtues and faults of this translation: The Chinese is often more explicit than the Sanskrit. It relies less heavily on anaphora, and so is clearer. It sometimes supplies explanatory phrases such as one finds in the prose paraphrases of Sanskrit commentaries. In verses 6 and 11 the Chinese reflects Sanskrit variants which are as good as, or perhaps better than, those in the extant Sanskrit text. The Chinese copes successfully with syntactic features such as the locative absolute and statements of reason by means of ablative noun compounds. It possesses a device for handling the highly-important abstract-noun suffixes.

As for the defects: There are several lexical mistakes, and a number of renderings that misrepresent the meaning of the original. The terms yu and wu do duty for all the derivatives of as and bhu as well as for upapadyate, uuyjate , vidyate , and their negatives. Sometimes a number-neutral Sanskrit term is pluralized in translation, and sometimes plurals are neutralized in translation. The worst defect in this chapter and also in the others is the handling of the logical operators — upapadyate, uuyjate, and prasajyate. When the latter occurs, it is usually rendered by shih shih pu jan (this thing is not so/true), which fails to indicate the exact sense—the ensuing of a logical consequence that is unwelcome to the opponent. The translations of these three terms are not consistent, however, and pu te (is not got) may render na vidyate (is not found, does not exist) as well as nopapadyate and na uuyjate . In the Prajna Sutras , te also does duty for upalabdhī (perception). This confusion of the existential, the modal, the logical, and the epistemological prevents anyone who does not know the Sanskrit from grasping the subtler points of the text.

The substitution of rhetorical questions for negative statements and vice versa is neither a virtue nor a defect. Placing attributive phrases after the headword is un-Chinese, but it adds a certain flexibility to this translation style, and does not lessen the accuracy of the translation itself.

The defects of such a translation are bothersome to the scholar who wishes to reconstruct a Sanskrit original but, with the exception of the mishandling of logical terms, I do not think that the mistranslations prevent the reader from understanding the Madhyamika system in the aggregate. Individual verses are wrong or misleading, but there is sufficient repetition in the text that if the student takes overall consistency as his standard he will not be misled very much by blemishes in the translations. He will be more likely to miss right ideas than to conceive wrong ones.

PINGALA COMMENTARY

1/16 Effects arise from causes, but these 'causes' do not have self-nature. If they do not have self-nature then they are not dharmas. If they are not dharmas, how can they arise? Therefore, effects do not arise from causes. As for not arising from non-causes; in denying causes we stated that there were non-causes, but in reality there are no such dharmas as non-causes, and therefore there is no arising from non-causes. If there is no arising from either of these two then there are no effects. Since there are no effects, there are neither causes nor non-causes.
14a Therefore not as its conditions themselves. . . .

does an effect exist. If we assume, on the contrary, that it is its non-conditions:

14b Nor does an effect exist as its non-conditions.

If cloth does not consist of threads, how could it consist of straw?

Our opponent objects: There may be no effect as such but there is in fact an inherent regularity (niyama) in both conditions and non-conditions. You say: ‘If a non-existent effect can issue from its conditions why should it not equally well issue from its non-conditions?’ But, if the effect whether cloth or straw mat — did not exist, it would not make sense that the conditions — threads or straw — should be causally effective. Therefore the effect too is real. (fn 6 i.e. certain ‘conditions’ are in fact connected with certain ‘effects’.)

We reply. The effect would exist if conditions and non-conditions existed. If the effect existed we could say such are its conditions and such are its non-conditions. After thorough investigation, however, that is not the case.

14cd As the effect is non-existent, how could there be either conditions or non-conditions?

The point is the same for conditions and non-conditions.

The conclusion is that things do not arise as entities having their being in themselves (svabhavatah).

As is said in the Ratnakara Sutra: ‘One who lives the absence of being does not exist as a fact, like the flight of a bird through the air; what in no wise possesses self-existence will never be a cause of something else.

‘What does not possess self-existence, how can it, lacking self-existence, be caused by anything else? How can what is lacking in self-existence give birth to anything else? Such is the nature of cause as taught by Buddha.

‘All the elements of existence are by nature immovable, not variable, beyond affect and blissful; they are imperceptible like a flight path in the sky and the unenlightened misconceive them.

‘As the rocky mountains are immovable so are the elements of existence immovable. They do not pass away nor do they arise: in this way has the victorious Buddha taught the truth.’

And from another source, ‘The truth of things as revealed by the victorious one, the lion among men, is neither born nor does it arise, it does not decay, it does not die. In it are merged all living beings.

‘What is not self-existent in any sense, cannot attain other existence either from within or from without, the lord is realized everywhere. Buddha has revealed the way of being at peace though no definable way has been attained; there you will walk what is called the way of liberation. Yourself free, you will free many other beings.’

KALUPAHANA COMMENTARY

Thus, the identity of condition and effect (pratyayamayam phalam), as implied in the identity theory of causation, as well as the difference between condition and effect (apratyayamayam phalam), as envisaged in the non-identity theory of causation, are both not evident (na samvidyate). The second statement is, indeed, the final conclusion of Nagarjuna in this immensely significant chapter. A superficial interpretation of this statement is bound to leave the impression, generally popular among the interpreters of Nagarjuna, that he rejected any form of causation, including the arising of an effect depending upon a cause or condition or a group of such causes or conditions (pratityasamutpada). Hence, Nagarjuna is perceived as a transcendentalist who recognized an "absolute" beyond all linguistic expression. (Following the prevalent interpretation, the present author himself has taken that position, see Buddhist Philosophy, p). A more careful contextual analysis would reveal that the effect (phala) Nagarjuna was referring to in this verse, as well as in the entire chapter, is one that is identical with the cause or different from it. It is only an effect understood in such a manner, as clearly indicated in the present statement, that he was categorically denying. If no such effect is seen, why speak of a condition (pratyaya) that is identical with an effect, or a non-condition (a-pratyaya) that is different from the effect?
14. First, Nāgārjuna points out, the opponent begs the question in asserting the genuine existence of the effects in question. They, like their conditions, and like the process of dependent origination itself, are nonexistent from the ultimate point of view. That is, they have no essence whatever. Hence, the third charge fails. As a consequence, in the sense in which the opponent supposes that these effects proceed from their conditions - namely that their essence is contained potentially in their causes, which themselves exist inherently - these effects need not be so produced. And so, finally, the effect - containing conditions for which the opponent charges Nāgārjuna with being unable to account are themselves unnecessary. In short, while the reificationist critic charges the Madhyamika with failing to come up with a causal link sufficiently robust to link ultimately real phenomena, for the Madhyamika philosopher the core reason for the absence of such a causal link is the very absence of such phenomena in the first place. We are now in a position to characterize explicitly the emptiness of causation and the way this doctrine is identical with the doctrine of dependent origination adumbrated in this chapter. It is best to offer this characterization using the via media formulation most consonant with Nāgārjuna's philosophical school. We will locate the doctrine as a midpoint between two extreme philosophical views. That midpoint is achieved by taking conventions as the foundation of ontology, hence rejecting the very enterprise of a philosophical search for the ontological foundations of convention (Garfield 1990). To say that causation is nonempty, or inherently existent, is to succumb to the temptation to ground our explanatory practice and discourse in genuine causal powers linking causes to effects. That is the reificationist extreme that Nāgārjuna clearly rejects. To respond to the arguments against the inherent existence of causation by suggesting that there is then no possibility of appealing to conditions to explain phenomena - that there is no dependent origination at all - is the extreme of nihilism, also clearly rejected by Nāgārjuna. To assert the emptiness of causation is to accept the utility of our causal discourse and explanatory practice, but to resist the temptation to see these as grounded in reference to causal powers or as demanding such grounding. Dependent origination simply is the explicability and coherence of the universe. Its emptiness is the fact that there is no more to it than that.

Keep this analysis in mind, for when we reach Chapter XXIV, in which the most explicit analysis of emptiness itself and of the relation of emptiness to the conventional world is articulated, we will see that the principal philosophical move in Nāgārjuna’s demystification of emptiness was this attack on a reified view of causality. Nāgārjuna replaces the view shared by the metaphysician and the person in the street, a view that presents itself as common sense, but is in fact deeply metaphysical, with an apparently paradoxical, thoroughly empty, but in the end commonsense view not only of causation, but of the entire phenomenal world. This theme - the replacement of apparent common sense that is deeply metaphysically committed with an apparently deeply metaphysical but actually commonsense understanding of the phenomenal world - will recur in each chapter of the text.

Chapter II: Examination of Motion
Chapter II

MAJBA (TOPICAL OUTLINE)

OUTLINE:

We are still in the first of the three parts of the text, the demonstration that dependent origination is essentially empty, and within that, we are still in the first of its two sections, the main point. Within that section we are still in the first of its two parts, the brief presentation. We have concluded the first section of the brief presentation, the refutation of the essence of phenomena through the examination of the agency and action of cause and effect [91:18], and we now turn to the second section, the refutation of the essence of the self through the examination of the action and agent of going and coming. This chapter constitutes that second section.

EXPLANATION:

Here it should be stated that although it has been explained through the refutation of arising [92] that the nonexistence of such things as cessation is established in order to establish that there is no coming or going in dependent origination, it is necessary to provide refutatory arguments specific to that topic. Here the refutation of coming and going should be understood as the refutation of coming and going as the nature of the object of uncontaminated wisdom. The commentary to the eighth chapter explains that since the goer and the action of going exist in mutual dependence, but do not exist inherently, the inherent existence of going and coming is the object of negation.
SUMMARY:

One should understand clearly the grasping by means of which one grasps the goer, the place where he goes, and the going not as posited as existing merely through the force of nominal convention, but as existing inherently. Having understood that, one should ascertain that when one searches to determine whether or not they exist in the way that they are grasped, their existence is undermined in various ways through the arguments explained above. The refutations through various analytic arguments are for the purpose of leading one to realize the untenability of the framework of action and agent in the context of inherent existence, [114] but not for the purpose of demonstrating the nonexistence of coming and going.

By understanding that, one should transform the mind which previously took all conventional things such as coming and going to exist inherently. One should then ascertain that agent and action is tenable only in the context of emptiness and going to exist inherently. One should then ascertain that when one grasps the goer, the place where he goes, and the going not as posited as existing merely through the force of nominal convention, but as existing inherently. Having refuted the inherent existence of going and the goer, one should understand that they merely exist in mutual dependence. [64b]

This can be understood through the following rearrangement:

The goer depends upon going. Going depends on the goer as well. Apart from depending arising One cannot see any cause for their existence.

First, one should ascertain the manner in which coarse manifest phenomena such as coming and going are essenceless. Thereafter one should ascertain how this applies to the case of a person coming from a previous life to this one and going to the next. With respect to the phenomena as well, one should practice by applying these arguments to that which, while arising, does not come from anywhere and which, while ceasing, does not go anywhere. One should also apply this in the same way to all cases of action and agent. Thereby one will develop profound analytic wisdom with regard to the way things really are, and all activities such as going, walking, sleeping, sitting, etc., will appear to be illusionlike.

This is the commentary on the second chapter, having twenty-five verses, called “the examination of coming and going.”

INADA (Chapter Introductions)

CHAPTER II - Examination of What Has and What Has Not Transpired

As the title suggests, this chapter is an examination of what is known to have transpired or gone (gata) and what is known not to have transpired or gone (agata). There is a temptation to translate the Sanskrit terms as simply the past and the future respectively, but on critical reading of the Karaka the argument centers on the idea of a past (transpired moment) and does not justify any assertion of a future in the ordinary sense. In developing the argument, however, the use of another term is necessitated in relating gata with agata. This term is ganyamana or the passing away in or from the present. Thus the above terms are respectively translated as "that which has transpired or passed (gata)," "that which has not transpired or passed (agata)" and "present passing away (gamyamana)."

The argument in the present chapter is undoubtedly addressed to those who maintain the idea of an individuality in things (the pudgalavadins) such as the case was with the Saimmitiya and the Vatsiputriya. The division of passage or movement (gati, gamana) in time is refruted on the grounds that to assert any one of the three moments does not necessitate the introduction of any of the other two terms. The chapter is a necessary sequence in the development of the doctrine of pratityasamutpada set forth in the opening chapter and it also engenders the mood and pattern for the critical analysis of the opponent's views expressed in the remaining chapters.

KALUPAHANA (CHAPTER OVERVIEWS)

2. Change or movement (gatagata ). Chapter II of the Karikas is an attempt to reconsider this conception of impermanence, i.e., change or movement. Such a reconsideration, like the examination of causality, was necessitated not by a desire to transcend it but by a desire to return to the original teachings of the Buddha. Here too the waters were muddied by the speculations of the Sarvastivadins and the Sautrantikas. In the first instance, Nagarjuna was compelled to re-examine the conception of causality because these two schools were confronting each other as a result of the former's recognition of a self-nature or substance (svabhava ). Why did the conception of self-nature emerge at all? As we have seen, the two schools had wrongly conceived of change and impermanence.

The Buddha described time and temporality in a more empirical way when he said that the arising of phenomena, the change of what has come to be and their cessation are evident.67 The three temporal periods of past (atita ), present (paccuppanna), and future (anagata ) in relation to phenomena were thus recognized. To refer back to the discourse on “Linguistic Conventions” (Niruttipatha) mentioned earlier, the Buddha even examined the three linguistic conventions (adhih-vacana) such as “existed” (ahosi ), “exists (atthi ) and “will exist” (bhavissati), pointing out that these should not be ignored.
However, in their enthusiasm to demarcate the boundaries of the three periods of time, the Sarvastivadins and the Sautrantikas were led to an atomic notion of time and temporality, unaware of the dangers that lay ahead of them. In order to overcome the difficulties they faced as a result of their acceptance of an atomic conception of time, the Sarvastivadins were bold enough to admit an underlying substance that remains unchanged, even though they did not realize that such a doctrine was incompatible with the Buddha’s notion of non-substantiality (anatman). The Sautrantikas, on the contrary, denying such a substance and claiming themselves to be the faithful interpreters of the discourses, still maintained the momentary destruction (ksanabhanga) of phenomena. They did not realize that their conception of the momentary destruction of phenomena was forcing them to recognize a subtle transmigrating entity. Hence, they came to be characterized by their opponents as “transmigrationists” (samkrantivadin).

Nagarjuna’s attempt, therefore, was to show that a speculative notion of time and temporality such as the one emphasized by the Sautrantikas was not an empirically justifiable one. A modern critic of a similar conception of time, William James, has provided the following analysis:

In short, the practically cognized present is no knife-edge, but a saddle-back, with a certain breadth of its own on which we sit perched, and from which we look into two directions into time. The unit of composition of our perception of time is a duration, with a bow and a stern, as it werea rearward- and a forward-looking end. The very first verse in Chapter II suggests the kind of movement or motion that is under criticism: “What has moved is not being moved.”

For someone to claim that what has already moved (= present), the underlying assumption is that even though there is a distinction in terms of temporality, there is indeed the sense in which what is being moved in the present is not different from what, on an earlier occasion, was also in a state of moving. This can easily give rise to the view that phenomena are in a constant flux, a continuous uninterrupted flow (santati). While such an explanation may account for the continuity of phenomena that are analysed into discrete events, it also explains the identity of each individual stream (santana). This latter idea, carried to its extremes, led to the metaphysical notion of a subtle but substantial personality (putgala), neither identical nor different from the aggregates (skandha). This is the school of “personalists” (pudgalavada).

Thus, following the same method that he adopted in criticizing the substantialist notion of causality, Nagarjuna focuses his attention on the metaphysical interpretations of ideas of change and movement, without attempting to deny the concepts such as “the moved” (gata), “the not moved” (agata), or “the present moving” (gamyamana) per se. After a detailed analysis of the unhealthy consequences of such metaphysical interpretations, Nagarjuna, in the end, specifies the sort of view he is criticizing when he maintained: An existing mover does not carry out the movement in any of the three ways. Neither does a nonexisting mover carry out the movement in any of the three ways. Nor does a person carry out a movement, both existing and non-existing, in any of the three ways. Therefore, neither the motion, nor the mover, nor the space moved is evident. (II.24-25.)

The ‘existing mover’ (sadbhuto ganta) is indeed similar to the ‘existant’ (bhava) possessing self-nature (svabhava) which was criticized in the previous chapter. The denial of motion, the mover, and the space moved is thus not a categorical denial but the denial of a substantialist interpretation of these phenomena. Even though the refutation of the substantialist view of existence (bhava, svabhava) remains the primary concern in Chapters I and II, the ideas examined in Chapter I seems to be predominantly those of the Sarvastivada school, while Chapter II seems to concentrate more on the tenets of the Sautrantikas, who were more aligned with the “transmigrationists” (samkrantivadin) and the “personalists” (pudgalavadin). The method developed in these two chapters provides a large framework on the basis of which the innumerable concepts are analysed in the chapters that follow.
Walking

I do not walk between
The step already taken
And the one I’m yet to take,
Which both are motionless.

Is walking not the motion
Between one step and the next?
What moves between them?
Could I not move as I walk?

If I move when I walk,
There would be two motions:
One moving me and one my feet -
Two of us stroll by.

There is no walking without walkers,
And no walkers without walking.
Can I say that walkers walk?
Couldn’t I say they don’t?

Walking does not start
In steps taken or to come
Or in the act itself.

Where does it begin?

Before I raise a foot,
Is there motion,
A step taken or to come
Whence walking could begin?

What has gone?
What moves?
What is to come?

Can I speak of walkers,
When neither walking,
Steps taken nor to come ever end?

Were walking and walker one,
I would be unable to tell them apart;
Were they different,
There would be walkers who do not walk.

These moving feet reveal a walker
But did not start him on his way.
There was no walker prior to departure.
Who was going where?

2. Motion

It may seem odd to place a chapter on motion so near the
very beginning of his work, but there are good reasons for it:
motion, after all, is a principal example of change and action;
the argument is also a template for other arguments in the
Karikas (3.3,7.14,10.13,16.7); and It is directly related to the
Buddhist soteriological concern of sentient beings moving
through the cycling of rebirths (samsara).

The argument of verses 3-11 is this: if the mover moves,
then we have separated the agent and the action into distinct,
independent, self-existent entities. If someone is a mover
without there being motion, then motion is separate and
cannot occur because it is not connected to a mover (v. 7).
There would also be a mover without motion - but by
definition, a mover moves, and so there can be no mover
without movement. There cannot be a mover that is not
moving, so we cannot find a mover independent of the
motion who has the motion. A mover must be moving and
thus does not begin to move. A mover is labeled a “mover”
only once he or she is moving – there is no pre-existing, non-
moving entity gaining a new attribute with a new action by a
distinct entity. (This reasoning occurs in other contexts. For
example, 23.17: “Errors do not arise in one who is already in
error, nor do error arise in one who is not now in error,” and
so errors cannot arise.) Again, Nagarjuna is highlighting not
only conceptual connections, but how our concepts of
“moving” and “mover” seem to make independent entities –
our conceptualizing-mind artificially parses up the situation
into distinct realities and cannot put them back together
again.

It is possible to give a spacialized reading to this chapter -
i.e., it is examining where moving begins. (See Mabbett 1984;
Westerhoff 2008, 2009: 129-52.) For example, verse 12
becomes: “Moving is not begun on the place moved over or on
the place not yet moved to, or on the place currently being
moved over - so where can moving begin?” This reading is
inspired by translators who are familiar with the Greek Zeno’s
arguments about the nonreality of motion. (Consider his
example of an arrow in flight: the arrow either occupies the
space it is in or another space. But it cannot occupy a space it
is not in, and if it occupies the space it is in, then it is not.
moving it cannot occupy more or less than the space it is in,
so the arrow is not really moving at all. All movement and by
extension all other types of changes are illusions.) But verses
12-13 are parallel to Zeno even if we do not spatialize the
argument: motion cannot begin in something that is already
moving or in what is not moving at all - so where can it begin?
The spatial reading may be a result of reading Nagarjuna
through the lens of Western philosophy rather than anything he actually meant. In fact, Nagarjuna is actually arguing the opposite of Zeno: Zeno and his mentor Parmenides thought change was an illusion, not part of true reality; for Nagarjuna, entities and activities seen as self-existent realities are the illusion, and the constant flux of what is actually real is affirmed. That is, Nagarjuna affirms there is the (empty) motion and denies any self-existent realities are involved; the Greeks denied the motion and affirmed permanent realities.

For Nagarjuna, a non-mover cannot be described in any terms of motion. This includes “non-motion” - if there is no motion, then there is nothing in reality to contrast with it. and so the concept of “non-motion” is meaningless. A “non-mover” is a change in a mover (like bhava and its absence [abhava]), not someone who has not moved. So there still is nothing stacionary, but someone who had moved (v. 15).

Note that the logical form of the second line of verse 15 is x and not-x and no third possibility: this is an implicit recognition of the law of the excluded middle - everything is either one thing or its opposite, with no third possibility in between. This will be discussed in the Essay.

A mover does not stop moving (v. 17) since one would no longer be a mover in that case. Verse 17 parallels the impossibility of anyone starting to move: no one can stop. We are either moving or not, and there is no third state of transition between them; so whether we are moving or not: no one ever stops moving.

Verses 18-20 again reveal the problems caused if we treat motion and a mover as self-existent entities. Motion and a mover are not identical - if motion is the same as the one who moves, then when the act of motion stops, the mover ceases too. But if they are distinct then there would be motion without a mover, and someone labeled “a mover” who does not move, which by definition is not possible. The next two verses reiterate the conceptual interdependence of the concepts of “motion” and “a mover.” (But as will be discussed in the Essay, a person – here, “a mover” – can exist prior to the act by which he or she gains an attribute – here, moving.)

In verse 21, Nagarjuna mentions establishing (siddhi) something for the first time. By “esta-blishing,” he means establishing that something exists – i.e., proving something supposedly that supposedly exists by self-existence actually exists by self-existence, or proving the emptiness of something (VV 21 Comm). Notice that is establishing the reality of something and not establishing a claim, as modern philosophers would do. (See below on “valid [upapanna]” in the commentary on VV 2.)

Since someone is not called “a mover” until he or she moves, there is no “mover” prior to the motion (vv. 22-23). But, on the other hand, this mover does not make a move other than the move by which he or she becomes called “a mover,” since only one move occurs; so someone who is called a “mover” does not make a new move.

Verses 24-25 suggest that motion does not exist: a truly existing mover does not move, nor does a nonexistent mover, nor does an existing-and-nonexisting mover exist. Thus, a motion, a mover, and the place of the motion are not found. But again, he is not arguing that motion is an illusion as with Zeno. Rather, he is arguing that if self-existent entities were involved, there could be no real motion and no real mover. Since we obviously see motion, Nagarjuna’s opponent’s premise of self-existence must be rejected. The result is an ontology of empty but nonetheless efficacious (and thus “real” in this sense) entities. Only motion as a substantive, self-generated reality is rejected.

GYAMTSO (COMMENTARY)

2

An Examination of Coming and Going

In the Sutra Requested by the Bodhisattva “Shining Intelligence,” the Buddha taught:

Form does not come and it does not go.

IN THIS CHAPTER, Nagarjuna proves the validity of this statement with logical reasoning.

Nagarjuna composed this chapter in answer to those who claimed, “Things are not of the nature of emptiness because they come and go—we see them coming and going all the time, so how could they not exist?” This is how it is for confused sentient beings: We see things coming and going, we think this coming and going is real, and we have experiences that seem to confirm to us that coming and going are real. As a result of these three occurrences, we conclude that phenomena are not empty of true existence.

Thus, it was necessary for Nagarjuna to demonstrate that coming and going are not truly existent in order to help his opponents, and us as well, to understand that things are actually of the nature of emptiness.

These three occurrences—that coming and going appear to be real, that we then think they are real, and that we have further experiences with regard to them that seem to confirm our belief that they are real—are not enough to prove that coming and going truly exist. All of these things happen in dreams, for example, and yet the coming and going that appear in dreams are not real at all. Similarly, they happen in illusions, in movies, with e-mail, and with water-moons. All of these examples of empty forms demonstrate that just because something appears to be real, that does not prove that it is.

Think of all the shapes and colors, all the different forms that appear to us in dreams. Whatever it might be that appears in the dream, it did not come from anywhere, and it
does not go anywhere. Similarly, all of the sentient beings in all of the six realms of samsara do not come from anywhere, and they do not go anywhere. If the beings in samsara came from somewhere else, then they would have to come from somewhere that is not samsara, meaning that they would have had to come from nirvana to samsara, and then they would go back to nirvana. That is not how it is, however— the beings in samsara did not come from nirvana to samsara, so they did not come from anywhere, and therefore they are not going anywhere either. The true nature of sentient beings is empty of coming and going.

Since sentient beings themselves neither come nor go, then this must also be the case for sentient beings’ ignorance and their mistaken belief in the true existence of the self, which are the roots of cyclic existence, as well as for the mental afflictions arising from these and the suffering that comes from the mental afflictions. These are all things that really do not come from anywhere and do not go anywhere. Their nature transcends coming and going.

In the Prajnaparamita Sutras, the Sutras of Transcendent Wisdom, the Buddha taught that all phenomena are of the nature of emptiness because they are empty of coming and going. For example, in the Heart of Wisdom Sutra the Buddha stated:

*There is no ignorance nor any ending of ignorance.*

Ignorance does not truly exist because it does not come from anywhere and it does not go anywhere, and since it actually does not exist in the first place, there can be no real ending of it either.

The first verse from this chapter reads:

*On the path that has been traveled, there is no moving, On the path that has not been traveled, there is no moving either,*

*And in some other place besides the path that has been traveled and the path that has not, Motions are not perceptible in any way at all.*

When we ask the question “Does movement really happen?” then we have to look for movement on the path where it would happen if it did actually exist. When we do, we can say that in fact there is no movement along this path, because there is no movement on the part of the path that one has already traveled; there is no movement on the part of the path that one has yet to travel; and in between those two, there is no place where you can see any movement happening at all. For these three reasons, therefore, there is no such thing as motion.

The first reason, that there is no motion on the path that one has already traveled, is valid because we have already crossed that part of the path. There is nothing happening there by definition because one has already moved along that part of the path. There is no longer any movement possible there.

The second reason is also valid. There is no motion on the path one has yet to traverse because movement there has not arisen yet. No motion has happened there yet because one has not yet been there. So there is no motion there either.

The third reason is also valid—that is that no motion is observable on some part of the path that one has neither traversed nor not traversed. The reason for this is that no such part of the path exists—there is no such place that one either has not already been or has yet to go. Besides the part of the path that one has already been on and the part that one has not been on yet, there is nothing in between. If we divide the path into these two parts, we cannot find any third part. Therefore, there is no motion there either.

Similarly, besides the motion that has happened in the past and the motion that has not happened in the future, there is no present motion; there is no action of moving. Someone may say, “There is motion after all, because there is the present movement of the legs walking.” Actually, though, that motion is just mere appearance, because in between the motion that has already happened and the motion that has yet to happen, there is no present moment of motion—you just cannot find it. For example, think of your finger moving back and forth. At any one point in time, in between the movement that has already happened and the movement that has yet to happen, you cannot find even the tiniest instant in which motion could occur. Thus, whatever point in time you are looking at you cannot find any present motion, if you think about it in this subtle way. There is no moving of the finger because in between the motion that has already happened and the motion that has yet to happen there is no present movement.

Snap your fingers and see if you can find the finger snap as it is happening. Is it happening in the present? When you snap your fingers, is that the present or the past? The first finger snap that has happened is the past—it is already over. The second snap has not happened yet, so that is the future. And in between these two, there is no present moment of the finger snap.

This is not an examination dealing with things on a coarse level; it is an examination that is looking at things from the perspective of the most subtle moments of time. For example, when we look at a finger snap, that moment can be divided into sixty-four individual units or instants, and those are said to be the most subtle moments of time in terms of what can actually be measured. But we can even go further than that. We can examine even these most subtle moments and see that they too are composed of millions of billions of tinier instants, and each of those instants is composed of an infinite number of subinstants, until finally we realize that there is no truly existent moment of time at all—there simply is no such thing as a “present moment.” Thus, since there is
no time in which motion could occur, in genuine reality it does not occur. There is no coming, no going.

Since it is the case that in genuine reality phenomena neither come nor go, that their true nature is beyond coming and going, it is also the case that our suffering neither comes from anywhere nor goes anywhere. The same is true of our mental afflictions—attachment, aversion, pride, jealousy, and stupidity—they neither come from anywhere nor go anywhere. Finally, all of our thoughts—no matter how profound or noble, no matter how vile or base—do not come from anywhere or go anywhere.

It is important for us to apply our understanding that things neither come nor go to these three things: our suffering, our mental afflictions, and our thoughts. Just as appearances in dreams, experiences in dreams, and thoughts in dreams neither come from anywhere nor go anywhere, so it is with all phenomena, and it is in this way that we have to analyze. For example, if it were the case with our suffering and our mental afflictions that some evil spirits were sending them into us, then they would in fact come to us from somewhere else. If there were some creator who was sending all of these bad experiences into us, then again they would come from somewhere else to where we are. Neither of these is the case, however, and therefore suffering, mental afflictions, and thoughts do not come to us from somewhere else, and they do not go anywhere when they are finished with us. Nevertheless, it is still the case that there are superficial appearances, mere appearances of these things, which arise due to the coming together of causes and conditions.

This is why in his Song of the Profound Definitive Meaning Sung on the Snowy Range, the lord of yogis Milarepa sang:

When you're sure that conduct's work is luminous light,
And you're sure that interdependence is emptiness,
A doer and deed refined until they are gone—
This way of working with conduct, it works quite well!

In this verse, Milarepa sang of his certainty that appearances arise in dependence upon the coming together of causes and conditions, and at the same time they appear, they have no inherent nature—their nature is emptiness. We have to apply ourselves to gaining the same certainty that Milarepa did.

Therefore, we have to take this analysis of things that shows they neither come nor go and apply it to our suffering, our mental afflictions, and our thoughts and see that these three things do not come or go. To put this into verse:

While we look with our eyes and it seems that things come and go,
When we analyze with intelligence, we cannot find any coming or going at all.
Therefore, know that coming and going are like dreams and water-moons.

A water-moon is a very good example to refer to in this analysis of coming and going. If a water-moon is shining on a lake and you walk around the lake to the right, due to the coming together of certain causes and conditions, the moon appears to follow you to the right. For your friends who are walking around the lake to the left, however, due to other causes and conditions, the moon appears to be following them to the left! And for your friends who are just standing still, the moon appears to be motionless. All the while, though, there is no moon that is moving at all. In this way, at the same time that things appear to come and go due to the coming together of causes and conditions, in reality there is no coming or going at all. To put this into verse:

When we analyze with intelligence, we cannot find any suffering:
Nevertheless, suffering is something we directly experience.
Therefore, know that suffering is appearance-emptiness, just like suffering in a dream.

When you gain certainty that the suffering that appears is empty of coming and going, the suffering will dissolve all by itself, and you will experience its true nature, which is open, spacious, and relaxed.
Supplemental Commentary

Westerhoff (Chapter 6)

6

Motion

At a prominent place at the beginning of the MMK Nagarjuna analyzes the concept of motion. This discussion, which takes up the whole of the second chapter, is concerned primarily with the investigation of two questions: first, “Where is the locus of motion?” i.e. where is motion taking place, and second, “What is the object of motion?” i.e. what is it that has the property of moving?

Imagine a car driving down a road, turning right at an intersection, then driving on. Where is it moving? We obviously do not want to locate motion anywhere where the car has just been, say twenty seconds ago, since this is not where motion is presently happening. Nor is a place where it has not been at all (say, turning left at the intersection) any better—not only is no motion presently taking place there, it has also not taken place there in the past. Neither the places the car has driven through in the past nor those it has not driven through are plausible candidates for locating its motion in the present moment. The car is obviously moving in the space it presently traverses, which constantly changes as what is present changes: for each moment, the car is presently moving where it is moving.

1. MMK 2:1.
2. MMK 2:8.
3. “As far as the place moved over does not move, the place not moved over does not move either.” gatam. na gamyate tāvad agatam. naiva gamyate. MMK 2:1a.

Second, what moves? Not the car which is parked nearby and is stationary (agantr.) but the one being presently driven. It is only the mover that moves. Now it appears that one of the main aims of Nagarjuna in this chapter is to analyze both these commonsensical answers—that present motion happens in the presently traversed space and that it is the mover that moves—in order to demonstrate that they are more problematic than they might initially seem. This impression is largely correct, but as we shall see, matters are in fact a bit more complicated.

The second chapter of the MMK has attracted considerable attention in the contemporary commentarial literature, not least among scholars interested in a certain kind of cross-cultural comparison, setting out to compare Nagarjuna’s arguments with Zeno’s paradoxes. The ways in which the chapter has been understood are very diverse and it does not seem that an interpretative consensus has yet been reached. This inconclusiveness is hardly surprising, given that this chapter in particular brings out the difficulty of doing two things at the same time: understanding the internal structure of Nagarjuna’s arguments and placing them in the argumentative context of his philosophical enterprise. After all, these arguments were not intended as particularized dialectical curiosities but occupy a central point in the structure of the MMK.

6.1. Arguments Concerning Motion

The arguments presented in the second chapter of the MMK can be best understood if we divide its 25 verses into three groups. The first group (verses 1–6, 8–11, 15–16, 22–25) investigates the locus and the object of motion by two arguments which I call the property-absence argument and the property-reduplication argument. As I will argue later on, these arguments are not specifically when that moment is the present moment. The locus of motion must be the space that is presently being traversed.

4. gamyamâne gatis. MMK 2:2b.
5. gantâ gacchati. MMK 2:10.
7. There is also a further argument supposed to show that there can be no motion in the space presently traversed. This is the so-called foot argument given by Candrakirti in his commentary on verse 1. Candrakirti presents this as a refutation of the opponent’s claim (supposedly implicit in verse 1) that motion takes place in the space presently traversed. This argument is slightly peculiar, as the opponent will explicitly make this claim in the following verse.

The argument attempts to show that the foot cannot be at the place presently traversed, since the foot is made up of atoms. But a place behind some atom at the front of the foot is already moved over, while some atom in front of some atom at the back is not yet moved over. There is some debate about how to interpret this argument (see, for example, Siderits and O’Brien [1976: 289] and Galloway [1987: 81–85] for diverging accounts).

245
motion. Nāgārjuna rather uses the example of motion to give an example of a form of argument which can be applied to a variety of subject-matters and is indeed referred to again and again in different contexts within the MMK. The second group of verses (12–14, 17) discusses the interdependence of the concepts “beginning of motion” and “end of motion” and the division of the triple division of the space and time where motion takes place. This is a division of space into a space not yet traversed, a space presently traversed, and a space to be traversed, and a division of time into the times of past, present, and future motion. Nāgārjuna’s aim in these verses is to establish that the concepts of beginning and end of motion and the triple division cannot exist independently of one another.

The third group (7, 18–21) considers the relation between mover and motion and sets out to establish that these two mutually depend on one another.

6.1.1. The Property-Absence Argument

In the property-absence argument Nāgārjuna seems to assert that some individual can be said to have a property only if it is at least conceivable that it lacks that property. An apple can have the property “red” because it is conceivable that it lacks redness and has some other property instead, such as being green. However,

[H]ow suitable is it to attribute motion to the space presently traversed, as far as attributing non-motion to it is not suitable? For whom motion is attributed to the space presently traversed, there should be such a space without motion—but “presently traversed space” means “movement takes place there.”

How suitable is it to say “a mover moves,” as far as a mover without motion is certainly not suitable? For the one who holds the position that a mover moves and who is looking for the motion of the mover, there is a mover without motion.9

Fortunately we do not have to settle this issue here, since this specific argument belongs more properly to the thought of Candrakīrti than to that of Nāgārjuna. I share Bhattacharya’s concern (1985: 8) about the mathematical gloss Candrakīrti’s commentary imposes on the reading of the first four verses of chapter 2 (see also Mabbett [1984: 409–410]). For more discussion of the “spatio-temporal” interpretation see section 6.1.1.

9. gantā tāvad gacchatītī katham evapatsyate / gamanenā vinā gantā yadā naivopapadyate // pakṣ. o gantā gacchatītī yasya tasya prasajyate / gamanenā vinā gantā gantur gamanam icchatāt. . MMK 2:9–10. In order to

We might wonder why it is a problem to say that the mover moves, or that motion takes place in the place presently traversed. After all those statements are not just true, but necessarily true. Furthermore, if “the mover moves” is true, “the mover does not move” is false. Yet Nāgārjuna asserts that if someone “holds the position that the mover moves […] there is a mover without motion.” How are we going to make sense of these statements?

What Nāgārjuna has in mind here is the difficulty of analyzing the referents of statements like the above in terms of an ontology of mutually independent objects. If we consider the referent of a statement such as “the apple is red,” it makes sense to regard the constituents of the state of affairs to which this refers (namely the individual apple and the property red) as distinct objects. After all, there are apples that are not red, and red things that are not apples. We rely here on the Humean principle that for things to be distinct we must be able to conceive of them independently of one another.10

For statements such as “the mover moves” or “bachelors are unmarried,” however, this thinking does not hold: there are no movers that are stationary, nor moving objects that are at rest; there are no married bachelors, nor unmarried non-bachelors. Nāgārjuna argues that in order to ascribe the property of motion to the individual that is the presently traversed space, or to the mover, we have to be able to conceive of this individual while the property is absent, in the same way as we can conceive of an apple lacking the property of redness, since it is green.

But in the case under consideration the individual depends11 on the property it instantiates. We therefore cannot analyze the referent of statements such as “the mover moves” in the same way as that of “the apple is red.” Such understand the structure of the argument, it is important to realize that 2:9–10 spell out the assertion made in 2:8, namely that neither the mover nor the non-mover moves. In fact Nāgārjuna considers only the first alternative; he does not specify why the non-mover does not move. But we can infer what he would say from 2:16, when he elucidates 2:15, being just the mirror-image of 2:8. 2:15 claims that neither the mover nor the non-mover is not moving. Here Nāgārjuna considers only the alternative of the mover not moving, a presupposition that is contradictory and therefore is to be discarded.

10. “We have observed that whatever objects are different are distinguishable, and that whatever objects are distinguishable are separable by the thought and imagination. And we may here add that these propositions are equally true in the inverse, and that whatever objects are separable are also distinguishable, and that whatever objects are distinguishable, are also different. […] [A]ll ideas, which are different are separable. For it follows from thence that if the figure be different from the body, their ideas must be separable as well as distinguishable: if they be not different, their ideas can neither be separable nor distinguishable.” Hume (1896: I, I, VII: 18, 24–25).

11. The dependence of the individual on the property it instantiates may be ontological or existential, depending on whether the individual has the property in question essentially. As nobody is essentially a bachelor a bachelor who marries would still continue to exist, but we would no longer describe him as a bachelor. But since ice is essentially frozen, when we heat up a block of ice to more than 30°C it is not just that we would no longer describe the result as ice, the ice would have ceased to exist.
an analysis would assume the existence of two distinct entities, a property and an individual, existing independently of one another (and therefore, as Nāgārjuna’s opponent would put it, each existing by its own svabhāva) which come together in a state of affairs where one instantiates the other.

A much later Tibetan commentary, Tsong kha pa’s rTsa she tīk chen, also detects the property-absence argument in these passages. Commenting on MMK 2:4, Tsong kha pa notes that “it is admissible to posit that agent and action are merely established by force of convention. However, it is impossible to assert that the action of going exists through its own characteristic.”12 If we regard the individual which is the agent, the one moving, and the action of motion, which is the property it instantiates as capable of existing without each other “through their own characteristics” like the apple and its redness, we are unable to make sense of how motion and mover could “fit together,” since they cannot “be taken apart.” But if we see them as two different ways of conceptualizing the same entity, as will be explained in more detail below, this difficulty does not arise.

THE SPATIO-TEMPORAL INTERPRETATION. We should note that there is a different interpretation of the two passages under discussion which, unlike the interpretation just presented, regards them as an argument specifically concerned with motion rather than more generally with the instantiation of properties.13 This spatio-temporal interpretation14 sees Nāgārjuna as concerned with refuting a particular conception of space and time by demonstrating that motion would not be possible given such presuppositions. These presuppositions are that space is infinitely divisible, but that time is not, and that it consists of a succession of temporal atoms of minimal duration. The argument then runs as follows. Let there be a moving object and consider the portion of space traversed by this object during one temporal atom. Even if this portion is very small, since space is infinitely divisible we can break it up into further portions of space. Now take some point within this portion of space. The moving object cannot have passed it during the course of its motion, since the time it would take to reach it would be a fraction of the temporal atom and since atoms are indivisible no duration that short exists. So motion cannot happen in the space presently traversed, since all that happens is that the moving object is at the beginning of the portion of space before the temporal atom, and is at its end afterward, without having moved through any of the points in between. We are thus dealing not with motion, but rather with a succession of rests. As a result, we (unsuitably) have to attribute non-motion to the space presently traversed. The same interpretation can be given to verses 9 and 10 of this chapter: a mover moving in an infinitely divisible space during a temporal atom would be a mover without motion (gamanena vinā gantā), because he does not traverse any of the infinitely many spatial points between the beginning and the end of the space traversed. Such a mover would be a mover at rest.

I do not want to deny that the spatio-temporal reading allows us to give a consistent interpretation of the individual verses discussed, as well as of some later verses in the chapter (always presupposing, of course, that Nāgārjuna really made these particular assumptions about the divisibility of space and time), and it provides an interpretative framework of which many later commentators availed themselves. Nevertheless I think that the interpretation in terms of properties and individuals has advantages which deserve to be brought out more clearly.

My main worry with the spatio-temporal interpretation (apart from a lack of explicit statements by Nāgārjuna concerning the views about space-time structure that he supposedly has in mind) is that the various references to the arguments in chapter 2 throughout the MMK15 are very hard to make sense of on the spatio-temporal interpretation. For example, Nāgārjuna remarks in the discussion of fire and fuel in chapter 10 that the remaining points concerning these have been discussed in the treatment of the presently moving object, the moved and the non‐moved.16 If we follow Candrakīrti’s interpretation that this statement means we can substitute “what has burned” (dagdha) for “what has moved” (gata), “what has not burned” (adagdha) for “what has not moved” (agata), and “what is presently burning” (dahyamāṇa) for “what is presently moving” (gamyamāṇa) throughout the second chapter,17 it becomes evident that this makes much more sense if we read it as an argument about the relation between properties and individuals rather than as an argument about the structure of space and time. For example, by substituting in MMK 2:3 we get something like the following:

How suitable is it to attribute burning to the presently burning fire, as far as attributing nonburning to it is not suitable? For whom burning is attributed to the presently burning fire, there should be such

15. In the dedication, as well as in 3:3, 7:14, 10:13, and 16:7.
16. “In the place of ‘fire,’ all the other cases can be expressed by ‘what is presently moving,’ ‘what has moved,’ ‘what has not moved.’” atrendhane sēsāmuktaṃ, gamyamāṇa-gata-gataiḥ. MMK 10:13b.
17. PP 211:8–12.
a fire without burning—but “burning fire” means “burning takes place there.”

If this argument has essentially the same structure as MMK 2:3, we should also understand it according to the spatio-temporal interpretation “as an argument against the model of motion which presupposes discontinuous time but a spatial continuum.” But this interpretation cannot be quite right, since the above passage does not refer to motion at all, so perhaps we should better say it is “an argument against the model of *change* which presupposes discontinuous time but a spatial continuum.” This solution then faces the problem that not all change involves spatial displacement; a burning flame, for example, changes while staying where it is. Is it then to be understood just as “an argument against the model of change which presupposes discontinuous time”? Of course there are some arguments in Nāgārjuna’s writing that can be understood in just such a way, such as the various formulations of the *traitākāyāsiddhi* argument (if we assume there are temporal atoms, nothing could change during the present since this change would entail that the ‘present’ atom had temporal parts”), but the above argument is not of this kind.

If, on the other hand, we refrain from interpreting the above in spatiotemporal terms, things become more transparent. If we read it as an argument about the relation between properties and individuals, we can see that Nāgārjuna makes the point that the fire and its property (i.e., burning) cannot be conceived of as mutually independent objects, like an apple and its redness, which come together in a state of affairs, for whereas it is possible for the apple and the property of redness to exist one without the other (if the apple is green, and redness is instantiated elsewhere), there cannot be an individual that is a fire and also not burning, nor can the property of burning be instantiated by something that is not a fire.  

The widespread use of the discussion of the mover, the non-mover, and the presently moving object throughout the MMK suggests, I think, (and this point will become more evident in the following discussion), that this section of the second chapter was not meant to be a specific investigation of the problem of motion and the various structural properties of time and space. Rather it uses the discussion of motion as an example to illustrate an argumentative template which can be used in a variety of contexts.

The use of the example of *motion* for the illustration of this template is explained by its centrality in the Buddhist worldview. After all, the term “mover” (*gati*, ‘gro ba) does not just denote moving objects in the everyday sense of the term, but more specifically refers to beings in transmigratory existence. In analyzing the mistaken presuppositions behind statements such as “the mover moves,” Nāgārjuna thereby attempts to clear away misconceptions likely to arise at the very core of the Buddhist view of human existence.

6.1.2. The Property-Duplication Argument

The property-reduplication argument raises another difficulty with the statements “present motion happens in the presently traversed space” and “a mover moves.” If motion is ascribed to the presently traversed space or to the mover, we suddenly end up with two motions rather than just one. If there is motion in the presently traversed space this eventuates two motions: that by which it is a presently traversed space, and also the motion itself.

Also, if the mover moves, two motions would be implied: that in virtue of which it is manifested as a mover, and, it being a mover, that [motion] with respect to which it moves.

general impossibility of action (*kriyā*); Walser (1998: 204): “Nāgārjuna’s root text indicates that there is something about the form of the argument in chapter 2 which should serve as a model or pattern for any subsequent argument”; and, interestingly enough, by Siderits and O’Brien themselves (at least concerning some verses of the second chapter): “The attack is not against motion *per se* but against a certain attitude towards language, and so its basic point will have effect wherever noncritical metaphysics is practiced” (1976: 294).

22. *gamyamānasya gamane prasaktam gamanadvayam / yena tad gamyamānam. ca yac cātra gamanam. punah. . MMK 2:5.

23. *gamane dve prasajyate gantā yady uta gacchati / ganteti cāyate yena gantā san yac ca gacchati. MMK 2:11. La Vallée Poussin’s edition has the beginning of 11b as *ganteti cayoate, “in virtue of which it is called a mover” (99:6). This is one of several places (such as 99:7, 105:15, 106:11) in the second chapter of this edition where the root *vac* (“to say”) instead of *aṇāj* (“to cause to appear,” “to manifest”) is used. The Tibetan translation as *mgon pa* supports the latter reading (see de Jong [1978: 37–38], May [1959: 62, n. 46]). The philosophical content of these passages is largely unaffected by this reading apart from the fact that the reading with *aṇāj* places less emphasis on the role of language in conceptualizing the mover as a mover.
To understand this argument, it is essential to note that Nāgārjuna regards both the presently moving object (gamyāmāna) and the mover (gantr.) as thin individuals. For an example of what I mean by a thin individual, consider the case of some object that is green, cubical, and heavy. When referring to such an object in language, we will generally form the nominalization of one of the predicates denoting its properties, which we then take to denote the object which instantiates the other two properties. Calling the object a “green, heavy cube,” we have turned the predicate cubical into the common noun cube, of which green and heavy are then predicated. According to the standard ontological interpretation of this expression, we are thereby referring to an individual with two distinct monadic properties. Let us call the property we turned into an individual by nominalizing the predicate the constitutive property, since it brings about or constitutes the individual referred to (in our example this is being cubical), and call the other two instantiated properties, since they are instantiated by the individual thus constituted (being green, being heavy). Which properties we regard as constitutive and which as instantiated depends on our choice. With equal justification we could have chosen to speak of a “heavy, cubical green thing” (so that being green is constitutive, being heavy and being cubical instantiated), or a “green, cubical heavy thing” (so that being heavy is constitutive, being green and being cubical instantiated). In each case we would have referred to a different individual with different properties.

Nāgārjuna distinguishes explicitly between constitutive and instantiated properties. The constitutive property of the presently moving object is that “by which that is a presently moving object” (yena tat gamyamānam); the constitutive property of a mover is that “in virtue of which it is manifested as a mover” (gantā iti cācyate) or “the motion by which the mover is manifested” (gatyā yayāyate gantā). An instantiated property of a presently moving object is “motion itself” (yat [. . .] gamanam); an instantiated property of the mover that “[motion] with respect to which it moves, it being a mover” (gantā san yac ca gacchati).

In the example of the green heavy cube we are dealing with a case where constitutive and instantiated properties are distinct; the cube is therefore a thick individual. A thin individual, on the other hand, is an object whose only instantiating properties are its constitutive property or properties entailed by its constitutive property.

A good example of a thin individual is a clap of thunder. A clap of thunder is a particular sound-event caused by rapidly expanding air along an electric discharge known as lightning. The particular sound made is the constitutive property of the thunder-clap; it is what makes a thunder-clap a thunder-clap. Of course a clap of thunder does not just have the property of making the sound it makes, it also has a certain volume, goes on for a certain length of time, can be heard only in a particular area, and so forth. But all of these properties are entailed by the thundering’s constitutive property of making the thundering sound. A clap of thunder does not have any other properties apart from these.

Nāgārjuna argues that in the case of thin individuals the familiar analysis in terms of objects instantiating properties no longer works. This problem is evident when we compare a statement about a thin individual, such as “The thunder roars” with one about a thick one, such as “Farinelli sings.” In the case of the latter it is clear that Farinelli existed before he started to sing, and at that time there was a silent Farinelli. But it would make little sense to apply this idea to the roaring thunder. There was no silent thunder present before it began to roar; it is the roaring as its constitutive property that brings the thunder about. We are therefore faced with essentially the same problem we encountered when discussing the property-absence argument. Since the thunder and the sound it makes are mutually dependent on one another for their existence, we cannot analyze states of affairs in which they feature in the same way in which we analyze those involving a thick individual, namely as being constructed of various independently existing entities, like the cube, the property of being green, and the property of being heavy.

If, however, we insist on conceiving of a thin object in the way in which we usually conceive of thick objects, we will end up with a duplication of properties. A thick individual has some properties that are logically independent of one another (in the case of Farinelli, for example, being a singer and having dark hair), and one of these can be used to constitute an object of which the other is then predicated as an instantiated property. But in the case of a thin object there is only the constitutive property and the properties this entails. If we think that every object is to be analyzed like a thick object, that is, by regarding

24. MMK 2:5b.
25. MMK 2:11b.
27. MMK 2:5b.
29. This concept of a thin individual should not be confused with the concept of a thin particular familiar from the contemporary metaphysical discussion. This concept denotes the object which is left when all the nonrelational properties are abstracted away. See Armstrong (1997: 109–110, 123–126).
31. MMK 2:5, 6, 23.
it as a collection of at least two distinct properties, one of which is regarded as an individual to provide the metaphysical condensation nucleus which can instantiate the other property, we end up with having to split up the single property into two: one of which does the work of a constitutive property, the other that of an instantiated property.\textsuperscript{32} Such a split is ontologically hard to make sense of, since we seem to be dealing only with one property seen in two different ways, and not with two distinct properties.

Tsong kha pa’s commentary underlines this point when he says:

The action of moving the foot is the referent of both phrases “the space which is being gone over” and “going.” As there is not more than one action of going and it would be contradictory for the action of going to be the referent of both terms, it is said that if either term was meaningful, the other would be devoid of meaning.\textsuperscript{33}

Tsong kha pa notes here that the very same motion can be conceived of both as an individual (namely the place where motion takes place) and as a property (the moving that takes place there). There is of course nothing contradictory in that, but there would be a problem if we thought that something about the nature of the motion determined that it was “really” an individual or a property. In this case one conceptualization would be objectively right in capturing the nature of motion, the other would be wrong. But both are equally feasible depending on our interests, and there is no possibility of deciding between the two in terms of some hard ontological distinction. It is a distinction that exists in our words and concepts but not in some reality beyond these.

The fundamental problem Nāgārjuna is concerned with here is that the conceptualization of some situation in terms of an individual instantiating a property is purely a result of cognitive convenience. We conceptualize something that is green, heavy, and cubical as a green heavy cube if cubes are what most interests us in the present context. But it is a mistake to rest an ontological distinction on such an intrinsically pragmatic fact by assuming that our conceptualization corresponds to the way reality itself is carved up, namely as consisting of an individual (the cube) instantiating some properties ( greenness, heaviness). The examples of thin individuals and the resulting multiplication of properties show us where the problem lies. But it is important to realize that Nāgārjuna’s arguments are not just directed against specific problems arising only for thin individuals.\textsuperscript{34} It is rather that these present a particularly extreme case indicating difficulties with the assumption of a ready-made world sliced up into individuals and properties in general.

The same problem of property duplication also arises when we consider this argument against the background of the classical Indian theory of grammar going back to Pāṇini. As Nāgārjuna makes clear, a duplication of the action of movement requires a duplication of its agent, and therefore two movers.\textsuperscript{35} Candrakīrti’s commentary on this presupposes Pāṇini’s theory of kārakas, a theory of the semantic relations between noun and verb.\textsuperscript{36} The underlying idea is that the various participants of an event described in a sentence occupy various participatory roles relative to the action denoted by the verb, roles which are generally marked by different grammatical cases.

Consider the following sample sentence:

In the palace the prince brings presents from the king to the queen on an elephant.

The event described here is one of bringing, as indicated by the verb, in which various entities participate: The prince is the agent ( kartr. , generally marked by the nominative case in Sanskrit), the princess is the object ( karman, in the accusative), the queen is the recipient ( sam. pradānam, in the dative), the king is the point of departure ( apādāna, in the ablative), the elephant is an instrument ( karanam, in the instrumental), and the palace is the location or “support” ( adhikaranam, in the locative case). The theory of kārakas provides us with a general account of how the different thematic roles the participants in an action might occupy can be expressed in Sanskrit by the various vibhaktis or cases.

Candrakīrti observes in his commentary on MMK 2:6 that the kāraka required by the verb gamyate “is moved” is an agent ( kartr) which is the mover ( gantr).\textsuperscript{37} If the property of moving thus requires a mover, given the reduplication of the agent of motion.

34. Nor do Nāgārjuna’s arguments concerning motion refute an ontology of thin particulars which tried to account for our talk of thin particulars, e.g. along the lines of trope theory (see also page 204). In fact an ontology that regarded only thin particulars each identical with its own svabhava as ultimately real might be quite attractive for Nāgārjuna’s Abhidharmika opponent. Needless to say, a Madhyamika would not accept such a theory. For some arguments why not, see Siderits (2003: 122–123).

37. “Since an action ( kriyā) necessarily depends on a means of accomplishing it ( svasādhanā) [which is] either the object ( karman) or the subject ( kartr. ) [of the action], the action of motion also involves an agent and therefore depends on an agent of motion.” yasmād avasyāmkriyā svasādhanam apanyate karma kartāram. vā | gamikriyā caivaṃ. kartary avasthitā | to gamāram apanyate. PP 96:8–9 Here sādhana is taken to be synonymous with kāraka.
of motion discussed above, we are faced with two distinct agents (one for each motion) rather than just one.

We might argue at this place that on the face of it there seems to be no problem for a single agent’s being the means of bringing about two actions simultaneously, as for example in the case of someone simultaneously smoking and typing. This does not mean that there are in fact two persons sitting at the desk, a smoker and a typer, rather than a single one, a smoking typer. Multiplicity of actions does not always entail multiplicity of agents.  

To see where the problem lies here, we have to have a closer look at the various conceptions of the nature of the kārakas or participants of an event in Indian grammatical theory. In his commentary Candrakīrti refers to Bhartrhari’s account when he claims that a kāraka is to be understood not as a substance (dravya) but as a power or capacity (śakti). The reason is that if the kāraka denoted a substance, the same object could not function in different ways in different contexts, as an agent in one and as an object in the next, or as an instrument in the third. The kāraka therefore refers to the powers of an object to fill specific roles in different contexts. The number of powers is diversified by the actions; the actions are not seen as properties of a single agent. For each action, such as smoking and typing, we therefore assume a separate power which serves as its agent. The problem now arises if we assume that the different powers assume a separate power which serves as its agent. The two actions performed, such as typing and smoking. The two are differentiated because of the different natures of the actions discussed above, we are faced with two distinct agents (one for each motion) rather than just one.

We therefore have to conclude that thin individuals cannot be analyzed in the same way as thick individuals if we want to escape the methodologically distasteful consequences of splitting up a single property and a single agent into two, thereby multiplying entities beyond necessity.

6.2. The Beginning of Motion

In verses 12–14 of the second chapter Nāgārjuna is concerned with the location of the point where motion begins (gamanasya āraṃbha). His argument can be best illustrated in the diagram in Figure 6.1.

For the sake of simplicity we consider both space and time to be discrete. There is a box which occupies different spatial points in succession: it starts off at point s1 at times t1 and t2 until it reaches point s2 at t4. The diagram thus depicts the motion of a box from the left to the right. If we ask where the motion of the box begins, the answer is obvious: the box commences its move to the right at point s2. To begin a motion at some point, an object must first be stationary at this point (so that there are at least two successive moments of time in which the box remains at the same point of space), and at the immediately following moment it must be located at an adjacent point of space. At t2 the box is located at point s2, at t3 at point s3. So point s3 satisfies the condition for being the place where motion begins.

Given that there seems to be nothing inherently problematic about this, why does Nāgārjuna claim that the place where motion begins “is nowhere perceived” (adrśyamāna sarvathā)? Nāgārjuna divides the space where motion takes place into three jointly exhaustive and mutually exclusive parts: the part already moved over (gata), the part presently traversed (gamyamāna), and the part to be moved over in the future (agata). To make things a bit more precise,
we can say that a place $i$ is presently traversed by some moving object if the object is at a spatially adjacent place $i_{-1}$ at the preceding moment $t_{-1}$, is at place $i$ at $t$ (which is the present moment), and at $i_{+1}$ at $t_{+1}$. Similarly $i$ is a place already moved over if $i$ is some moment in the past, and a place to be moved over if $i$ is in the future.

Now assume that the place where motion begins (let us call this $b$) is one of the places already moved over. In this case the moving object would have to have come from some adjacent place $b_{-1}$ at a moment before $t$ (where $t$ is in the past), reached $b$ at $t$, and moved to $b_{+1}$ at $t_{+1}$. But it is obvious that this cannot be the case, since if $b$ is the place where motion begins, the moving object cannot have gotten there from another place at the immediately preceding moment, because then $b$ would just be one of the places moved over. Since a place already moved over must have been occupied by an object coming from the immediate vicinity at the immediately preceding moment, $b$ cannot be one of these places.

If $b$ was a place already moved over, the moving object would have come from the immediately preceding point of space, so there would have to be motion from $b_{-1}$ to $b$, that is, motion before the beginning of motion. But $b_{-1}$ cannot be taken to be either a place already moved over, nor a presently traversed space, nor one yet to be moved over, since all of these are to be found after the beginning of motion. Therefore $b$ cannot be a place already moved over. Analogous arguments show that $b$ also cannot be a presently traversed place or a place to be moved over in the future. It is evident that the same argument can be run concerning the place where motion stops; for the reason just given, it cannot be located in any of the three parts of the space where motion takes place.

A simple numerical model illustrates this point: if we define a set of numbers such that for every number in it, that number’s direct predecessor and direct successor must also be in the set, it is clear that this set cannot have a smallest (or largest) element. Suppose $x$ was this smallest element; then $x$’s predecessor would also have to be in the set, but this is smaller than $x$, so $x$ cannot be the smallest.

A different interpretation of Nāgārjuna’s argument for the unfindability of the beginning of motion is given by Siderits and O’Brien. Their interpretation

44. “One does not stop after the presently traversed [space], after the [space] moved over, also not after the [space] to be traversed.” na tiṣṭhāti gamyamānāṁ na gatān nāgatād api. MMK 2:17a.

is based on the presupposition that Nāgārjuna assumes the infinite divisibility of time as a background to his argument in verses 12 to 13. Suppose some temporal interval consisted of some object first at rest, then later starting to move.

Now take the moment of time $t$ dividing the rest from motion. No matter how short $t$ is, it can always be divided further, subdividing its initial sub-moments under “rest,” and its later sub-moments under “motion.” Adding together “rest” and “motion” will then cover the entire duration of the temporal interval, without any place for $t$. On this “knife-edge” view of $t$ there is no moment where motion can begin, since $t$ is just the dividing-line between rest and motion. It is not a temporal duration where anything can happen.

We might want to note that matters don’t improve if we assume that time consists of discrete indivisible atoms. If we regarded $t$ as an atomic moment between the last moment of rest $t_{-1}$ and the first moment of motion $t_{+1}$, we are again faced with the problem of where to locate $t$ in the exhaustive division of the temporal duration into past, present, and future motion. Since the beginning of motion cannot be in the past or future, our best bet is the present motion. But then since $t$ is atomic, it cannot be the moment of present motion, since nothing moves during $t$: there can be no changes during an atomic moment of time.

A third argument for the impossibility of locating the beginning of motion in the present motion is suggested by Candrakīrti’s commentary on verse 12. Candrakīrti claims that the beginning of motion “is also not in the present motion, since that does not exist and because it [absurdly] eventuates two actions and two agents.” This statement obviously is a reference to the property duplication argument mentioned in verses 5–6 and 11. In analogy with our interpretation of this argument given above, we could here read Candrakīrti as trying to establish the impossibility of conceiving of the beginning of motion and its property of spatial location as independently existent objects. This point can then be generalized to apply to different examples of change and their respective locations.

Unfortunately Nāgārjuna’s verses do not allow us to decide which (if any) of the three arguments he had in mind. The enterprise of rational reconstruction can here only suggest plausible alternative arguments which the Mādhyaamika might want to put forward. We cannot tell what the argumentum ipsissimum of Nāgārjuna might have been.

47. nāpi gamyamāne tadabhāvāt kriyādvyaprasan’ gāt kartr. dvayaprasan’ gāc ca. PP 100:8.

We shall therefore continue the discussion by assuming that it has been established by one of these arguments that the beginning of motion is not to be found anywhere within the three parts of the space where motion takes place. Nāgārjuna now points out that this fact entails a problem for the discrimination of these three parts of space. \(^{49}\) That portion of the way that has been moved over in the past is just the collection of all the spatial points each of which is \(gata\) — that is, for each of these points the moving object must have been located at this point at some past time \(t\), and it must have been at a preceding point at \(t-1\) and at a succeeding point at \(t+1\). But in order to know how many points to include in the collection, we have to know where the motion begins. Otherwise we would not be able to distinguish those spatial points that have not been moved over from those that have. The same problem arises when we try to ascertain which collection of points forms the part of space yet to be moved over. Here we have to determine which point is the end of motion in order to distinguish the part that is yet to be moved over from that which is not.

It is now clear that in verses 12–14 Nāgārjuna is arguing for two conclusions. First, given the conceptual resources of the triple division of the space where motion takes place into the space that has been moved over (i.e., a collection of spatial points each of which is \(gata\)), the presently traversed space (the point which is \(gamyamāna\)) and the space yet to be moved over (the points which are \(agata\)), it is not possible to define the spatial point where motion begins. This is so because in order to be in one of the three divisions, a point must have had the moving object move to it at the preceding moment, whereas to be the beginning of motion, a point cannot be such that something has just moved there, since it would then just be one of the many points across which motion takes place.

But this passage is not just about the definition of concepts. Since the triple division of the space where motion takes place is seen to be exhaustive, and since the above argument shows that none of the points in the triple division can be the beginning of motion, this reasoning implies that the beginning of motion cannot be anywhere within the space where motion takes place. \(^{50}\) But this conclusion seems peculiar, since the beginning of motion is where motion takes place, not where it does not.

Second it is not possible to define two of the three divisions, namely the space that has been moved over and the one that is yet to be moved over, without reference to the point where motion begins and its dual, the point where motion stops. These two are essential cognitive resources for our understanding of motion. They must provide the dividing line between the space that has already been moved over and the one that has not, as well as that between which is yet to be moved over and that where no motion is going to take place in the future.

We are therefore faced with a paradox. The triple division of space where motion takes place presupposes the beginning of motion. The beginning of motion in turn presupposes the triple division of space in which this beginning is located. But the beginning is nowhere to be found within the space triply divided, nor would it make sense to say that it exists outside of that space. The beginning of motion therefore must both exist (since it is conceptually necessary given the triple division of space) and cannot exist (since we can demonstrate that it cannot exist at any location within this division). \(^{51}\)

The paradox can be resolved by our rejecting the assumption that the beginning of motion is findable. We thereby deny that it can be picked out by a set of properties it has independent of us, who conceive of the space where movement takes place, for example by saying that some point \(b\) qualifies as the beginning of motion if the moving object occupies it at time \(t\) but did not occupy the directly preceding spatial point at the immediately preceding moment, or by trying to squeeze \(b\) into the infinitesimal temporal moment between rest and motion. Since on such an understanding \(b\) turns out to be unfindable, we must come up with another conception of \(b\). The idea here is to deny that any point qualifies as the beginning of motion independently of us, but that it is rather our decision to regard it as such a point that makes it the beginning of motion. This does not mean that we could pick absolutely any point and take it to be the beginning of motion, but as long as certain boundary conditions are observed (e.g., that the beginning of motion must be temporally and spatially before the place presently traversed), we can pick an arbitrary point and declare it to be the beginning of motion. What this means is that we regard that part of an event which begins with the presence of the moving object at a given point and stretches up to its being located at the space presently traversed as a single event, regardless of whether the moving object occupied an adjacent point at...
the immediately preceding moment. By deciding to regard some moment as the beginning of motion, we split up the flow of events according to our cognitive needs and regard everything between this and the similarly imposed end of motion as part of a single event of motion.

In this way the paradox disappears. We can still have the triple division of the space where motion takes place and have the beginning (and end) as boundaries of this. These two points are no longer unfindable, since according to the present interpretation they are just where we draw the line between one event and another; they do not have to fulfill any additional conditions like the ones given above. As Nāgārjuna argued earlier on, the triple division of space is conceptually dependent on the notion of the beginning of motion. This, however, does not mean that the beginning of motion has to have any existence apart from the cognizing subject; in fact it is precisely this assumption that leads to the problems described by Nāgārjuna in verses 12 to 14. The beginning of motion (as well as the beginning of events in general) is not something found out there in a ready-made world, but a boundary drawn by the mind in accordance with one’s particular interests and needs. On the basis of such an imposed boundary, we can then establish the triple division of space and time into where and when an event had already taken place, where and when it is presently taking place, and where and when it will take place.

6.3. The Interdependence of Mover and Motion

Nāgārjuna observes that the concepts mover (gantr.) and movement (gamanam, gati) are existentially dependent on one another. The concept of a moving object requires that of a movement this object carries out, the concept of movement must be the movement of something, that is, of the moving object. This mutual dependence implies for Nāgārjuna that mover and movement can be regarded neither as identical nor as distinct objects. To regard mover and motion as identical would imply that agent and action are considered to be one object (ekībhāva). This would mean that no agent could ever perform two distinct actions, since to do so he would have to be identical with two distinct things. The agent must therefore vary with the action, for example by being regarded not as a substance (dravya) but as a power (sakti) to carry out a certain action, as is done by Candrakīrti in his commentary on verse 6. As these powers come into and go out of existence, there arises the problem that there would be no continuous existence of a single agent performing a sequence of actions over time. Since this point generalizes to individuals and their properties as a whole, a theory that regarded these two as identical would have difficulties in explaining how we could ever regard such a sequence of distinct individuals and properties as a single unified temporally extended object. A more specifically Buddhist difficulty would arise in connection with the concept of karma. If for every action there is a distinct agent, what reason is there for the karmic consequence of an action to apply to one agent rather than another? Since ex hypothesi none of the later agents are identical with the original one, there seems to be no justification for the karmic result to be reaped by one rather than another.

Mover and motion also cannot be regarded as distinct. It is important to note that here, as well as in other contexts, Nāgārjuna uses the word “distinct” to mean “independently existent.” If mover and motion existed independently, like a piece of cloth and a pot, as Candrakīrti puts it, it would be possible for a stationary mover to exist, or for a movement to exist that was not the movement of any object. But since the two are existentially dependent on one another, neither of these situations, is in fact possible.

While the identification of mover and motion led to problems with the continuity of an individual over time, as we have just seen, regarding them as existentially independent generates a different problem. Even if we adopt the more sensible position of interpreting independence here as meaning that motion could be instantiated in a different object from the one in which it is in fact instantiated, and that the moving object could instantiate a different motion from the one it in fact instantiates, we end up with having to postulate a thin particular, a substratum which remains once all the properties have been abstracted away. For if any property could just leave the individual and go instantiating somewhere else, how are we to characterize the individual? Since any property can exist in principle without it, it must be something which could in principle exist without any of its properties.

54. This is a familiar problem for theories that equate objects with sets of properties. As two sets are identical if they have the same members, an object could never lose a property and yet remain the same object. Compare Armstrong (1978: 37–38).

55. See Tsong kha pa Blo bzang grags pa (1973: 372). Kalupahana (1991: 128) interprets the identity of agent and action as the position of the Sarvāstivādins, who assume “identity (svabhāva) on the basis on an eternal substance (svabhāva), thereby rendering the attribute (laṅkṣaṇa) an ephemeral [sic] or impermanent come-and-go entity.”

56. PP 105:5.

The difficulty resulting from treating mover and motion as independently existent objects is also what is behind Nāgārjuna’s assertion in the final verses of chapter 2, where he says that neither an existent, nor a non-existent, nor a both existent and non-existent mover can carry out a triple movement.58 It is easiest to fit this verse into the argumentative context of chapter 2 by regarding the “triple movement” as not referring to movement in the past, present, and future,59 but by following Candrakīrti’s commentary.60 According to this interpretation “existent mover” here means one in which the activity of moving (gamikrīyā) inheres, a non-existent mover is one in which it does not inhere, while a mover that is both is an entity in which it both inheres and does not inhere. Saying that the movement, which is to be understood as the space gone over (gamyaya)61 is “triple” equally means that either the activity of motion inheres in it, fails to inhere in it, or both.

On this interpretation we are left with nine distinct possibilities: that a mover in which the activity of motion inheres moves at a place in which this activity inheres also, that a mover in which the activity of motion inheres moves at a place in which this activity does not inhere, and so forth for the remaining possibilities. The philosophical idea behind this is straightforward. We should not assert that a mover in which the activity of motion inheres moves at a place in which this activity inheres also, if this assertion is supposed to mean that the activity of motion inhering in the mover is independent of its inhering in the mover. This is so because one depends on the other: motion can inhere in a mover only if it moves at some place, a place can be the locus of motion only if something moves at it. Furthermore, it cannot be the case that a mover in which the activity of motion inheres moves at a place in which this activity does not inhere, since it would then not be a space gone over. It is obvious that the remaining examples are to be treated in a similar way. The “contradictory” third alternative of both inherence and non-inherence seems to be given by Nāgārjuna merely for the sake of completeness, as supposing that some property both inheres and fails to inhere in some object is inconsistent.62 The bottom line63 of the above arguments concerning the interdependence of mover and motion is that while the concepts of mover and motion (and, more generally, agent and action and individual and property) have to be regarded as non-identical, neither of them can be regarded as self-sufficient or existing from its own side, since the existence of each requires that of the other. It is therefore somewhat misleading to take Nāgārjuna as arguing that mover and motion are not real.64 While it is certainly correct to say that Nāgārjuna thinks that mover and motion are illusory to the extent to which the way they appear (namely as independently existent entities) is not the way they really are, their lack of reality is quite different from that of other non-existent objects, such as hares’ horns and present kings of France, which do not exist even at the level of conventional reality (samvratisat).

6.4. The Second Chapter of the MMK in Its Argumentative Context

The second chapter of the MMK must be understood as playing a double role in Nāgārjuna’s philosophical enterprise. On the one hand it is part of the discussion of a variety of different entities (such as agent and action, suffering, time, nirvāṇa and so forth), attempting to show that none of them exists substantially, that is, by svabhāva. In this context the examination of motion deserves a particularly prominent place because of its centrality in the Buddhist worldview. Cyclic existence or saṃsāra is after all nothing but the moving about (samatsa) in the various realms of rebirth. When Nāgārjuna argues that mover, motion, and so forth are empty of svabhāva, he uses the terms both in their everyday and in their soteriological sense, where the mover (gaṇī) is the subject to be reborn and motion is the move from one life to the next.

It is in the context of this discussion that Nāgārjuna’s arguments about the beginning of motion and the identity and difference of mover and motion have to be understood. If we accept Nāgārjuna’s conclusion that the beginning (and end) of motion are nothing to be found “out there” in the world, but rather

59. Siderits and Katsu (2006: 145–146). See also Garfield (1995: 133), who also translates the Tibetan of MMK 25a (yin dang ma yin gyur pa yang / ’gro rnam gsum du ’gro mi byed) as “Neither an entity nor a nonentity moves in any of the three ways,” rather than as “An object which both exists and does not exist does not carry out a movement in any of the three ways.”
61. tatra gamyata iti gamanamihocyate. PP 107:9.
are a boundary established by the mind, this notion also entails that the beginning and end of a particular motion in samsāra, that is, a particular birth and a particular death, have no objective existence either but are merely conventional ways of cutting up the flow of cyclic existence into conceptually convenient bits. Seen the other way round, the concepts of past, present, and future lives arise only once we have decided to mark particular places in the continuity of consciousness as “birth” and “death.” Read in this soteriological way, Nāgārjuna’s arguments in this section of chapter 2 of the MMK aim to establish that such central concepts as birth and death, past, present, and future lives are no objective features of reality but merely conventionally real boundaries drawn by the human mind. This concept is made more explicit by Nāgārjuna in chapter 11 of the MMK, where he notes:

Where the earlier, the later, and the simultaneous do not appear, how [is there] a proliferation [of the concepts] “birth,” “ageing,” and “death”? 65

Given the cyclical nature of samsāra, what is earlier and what is later is very much dependent on where we identify the starting point. The hands of a clock will reach “3” before “5” if we start at “2,” but they will reach “5” before “3” if we start at “4.” Since Nāgārjuna has argued that the starting point is not something “out there” but a boundary drawn by us in order to accord with our specific cognitive concerns, it becomes evident that we cannot ascribe any objectively existing referents to such concepts as “earlier” or “later,” “birth” or “death,” and “past life” and “future life.” 66

The discussion of the identity and difference of mover and motion addresses another crucial issue which will be taken up again by Nāgārjuna, namely the question of the status of the subject transmigrating through a succession of rebirths. Clearly the mover (the person in cyclic existence) cannot be identical with each different rebirth, since it would then be identical with a number of things that are taken to be distinct at the conventional level. But it can also not be distinct from them, because anything resembling an ātman-like transmigrating substance is ruled out in the Buddhist view of persons. There is therefore something fundamentally mistaken with the view that the transmigrating person and his rebirths are two entities which could be related by identity and difference.

The relevance of the arguments in chapter 2 for refuting the idea of a transmigrating person is also stressed by Tsong kha pa: 68

Then, when the notion of substance with regard to a person has been refuted, some think “Since there exists an agent who comes from the previous life to this one, and then goes to the next life, and who performs virtuous and non-virtuous actions, this does not make sense.” To refute this [Nāgārjuna presents] the two [chapters] “Examination of Motion” [MMK 2] and “Examination of the Agent” [MMK 8].

While it thus appears that the arguments in the second (12–14, 17) and third (7, 18–21) group of verses of the second chapter are concerned with the investigation of the existence of svabhāva in various entities connected with motion in both the everyday and the soteriological sense, the first group (1–6, 8–11, 15–16, 22–25) is intended to play a more general role. It is not just that the concepts of mover and motion have to be understood in more than one sense, but rather that they serve as placeholders for which a variety of other concepts denoting an individual and a property could be substituted. Nāgārjuna’s aim in these verses is therefore primarily to establish an ontological conclusion about the relation between individuals and their properties. By considering predications involving thin individuals (such as “the mover moves” or “the fire burns”), Nāgārjuna establishes that the standard analysis of predication into individuals and properties, which conceives of them as mutually independent entities combined in a state of affairs, is not satisfactory as a general analysis. Statements referring to thin individuals cannot be analyzed in this way. Furthermore, Nāgārjuna wants to argue that this problem generalizes to analyses involving thick individuals as well. Once we have accepted that talk of individuals and properties in the case of such statements as “the mover moves” is nothing more than the projection of forms of language which are mistakenly given ontological weight, we will be much more reluctant to take this analysis ontologically seriously in other contexts. We should rather conceive of this analysis as a reflection of what is cognitively convenient for us rather than as a structure of the world mirrored in our language.

65. yatra na prabhavanty ete pūrvāparasahakramāh. / prapan” cayanti tām. jātim. tai jātāmarāṇam. ca kim . MMK 11:6.

66. Jay Garfield observes that “to see particular entities as having determinate, nonconventional beginnings of existence and determine, nonconventional termini and, hence, that there are distinct times at which there is a clear fact of the matter about whether or not they exist, independent of conventions for their individuation, is to see those entities as having necessary and sufficient characteristics for their identity, that is, as having essences [i.e., svabhāva]. […] Once we see the world from the standpoint of emptiness of inherent existence, the history of any conventionally designated entity is but an arbitrary stage carved out of a vast continuum of interdependent phenomena” (1995: 199).

CANDRAKĪRTI COMMENTARY

[Chapter IV]

Denial of past, future and present movement

One may interject that, although, by denying origination as an attribute of the true way of things, it is established that neither perishing nor any of the other attributes hold for the true way of things, still, in order to prove that neither coming nor going hold of the true way of things, what additional arguments can you offer for denying to and fro movement as this is commonly understood?

We reply that, if there were something called movement (gamana), it would have to be conceived of as relating either to a path of motion already traversed (gata), or not yet traversed (agata), or just being traversed (gamyamana). Nagarjuna says that in none of these ways does movement make sense.

KALUPAHANA COMMENTARY

Chapter Two Examination of The Moved and the Not-moved (Gatagata-pariksa)

GARFIELD COMMENTARY

Chapter II Examination of Motion

The target of Nāgārjuna’s arguments in this chapter is any view of motion according to which motion is an entity, or a property with an existence independent of that of moving things, or according to which motion is part of the nature of moving things. These are versions of what it would be to think of motion as nonempty. It might be quite natural for a reificationist to reply to the arguments in Chapter I by proposing that such a view must be the case. For in Chapter I Nāgārjuna does presuppose, in developing the view that conventionally things do arise dependent upon conditions, that there is motion, or change. For if there were not, there would be no arising. And as we have seen, this would indeed be an absurd consequence for Nāgārjuna. So, one might think, even if the links between conditions and their consequences are empty, the change represented by the arising of these consequences must be real.

Nāgārjuna argues that from such a view a number of absurd consequences would follow: Things not now in motion, but which were in motion in the past or which will be in the future, would have to undergo substantial change, effectively becoming different things when they change state from motion to rest or vice versa; a regress would ensue from the need for the entity motion itself to be in motion; motion would occur in the absence of moving things; the moment at which a thing begins or ceases motion would be indescribable. Nāgārjuna concludes that a reification of motion is incoherent. Motion is therefore empty.

**ENGLISH TRANSLATIONS**

**INADA (Skt):**
Verse 1 - Indeed, that which has transpired does not come to pass nor does that which has not transpired. Separated from these (gatagata), the present passing away cannot be known. - Note: S. Yamaguchi enlightens us that the final "na gamyate" refers to the fact that a certain condition is unknowable or inconceivable.

**JONES (Skt):**
[1] What has already been moved is not now being moved. What has not yet been moved is also not now being moved. But apart from what has already been moved and has not yet been moved, any current motion is not being moved.

**KALUPAHANA (Skt):**
What has been moved, in the first instance, is not being move. What has not been moved is also not being moved. Separated from what has been moved and has not been moved, present moving is not known.

**MCCAGNEY (Skt):**
What has already gone is not what is going as much as what has not yet gone is not what is going. Separated from what has already gone and that which has not yet gone, the present process of going does not go.

**NISHIJIMA (Skt?):**
1. As a memory of action in the past 'Gone' is absolutely different from a real act to go at the present moment, Similarly a supposition of action in future 'Not Gone' is also absolutely different from a real act to go at the present moment. And leaving from a memory in the past 'Gone' and leaving from an image in future 'Not Gone', Even a present recognition of 'Is Going' is also absolutely different from a real Act dimensionally, which is actually going on just at the present moment.

**SPRUNG (Skt):**
1 There is no motion, first, in what has been traversed, nor in what has not yet been traversed, nor in what, as something distinct from what has and has not been traversed, is just being traversed.

---

259
GARFIELD-SAMTEN (Tb):
1. Now, where one has gone one does not go.
Where one has not yet gone one does not go.
Apart from where one has gone and where one has not
gone,
That over which one goes cannot be conceived.

HAGEN (paraphrase):
What has moved is not moving now. What has not
moved is also not moving now. Yet apart from
these, present motion is inconceivable.

GOLDFIELD (Tb):
On the path that has been traveled, there is no moving,
On the path that has not been traveled, there is no moving
either,
And in some other place besides the path that has been
traveled and the path that has not,
Motions are not perceptible in any way at all. (1)

PINGALA COMMENTARY
2/1 In the already-gone there is no going, since it is
already gone. If there existed an 'action of going separate
from 'going' this would not be right. The not-yet-gone
similarly has no going, since there is not yet any dharma of
going. The moment of going' means half gone and half not-
yet-gone, because it is not separate from the already gone
and the not-yet gone. Question.

CANDRAKĪRTI COMMENTARY

(exception A alternate translation might be: What has moved does
not move, or is not in motion; what has not moved does not move;
and what, as something distinct from what has and has not moved,
is just moving, does not move. Nagarjuna's analysis gains some of
its strength from the fact that his Sanskrit terms are both spatial
and temporal, inextricably.)

Where, on the path of movement (adhvajata), the
activity 'motion' (gamikriya) has ceased is said to have
been traversed. That sector which is just being entered
by a present activity of motion is said to be where
movement is (gamyate). What has been traversed —
where the activity 'motion' has ceased - because it is
associated with a present activity of motion is spoken
of as being 'in motion'. As this statement is clearly
illogical it is not tenable to say what has been traversed
is in motion (in 2 Or, that past motion moves.). The word
'first' indicates the sequence of refutation.

And now the statement 'There is no motion in what
has not yet been traversed.' The sector of the path of
movement which has not yet been traversed is where
the activity 'motion' has not yet arisen, it is the future
(anagata). But to be in motion is present, and because
future and present are irreconcilable it is equally
untenable to say what has not yet been traversed is in
motion. If a sector has not been traversed how can
there be motion there? Where there is motion how can
one say it has not been traversed?

Nor is there movement in the sector just being
traversed, for 'There is no motion in what, as
something distinct from what has and has not been
traversed, is just being traversed.' The thought here is
that the space which the mover has passed through is
for him traversed and the space he has not yet passed
through is for him not yet traversed. But we never
observe another, third sector of the path of movement
unrelated to what has and has not been traversed
called 'in traverse' (gamyamana) (in 3 Or, just being
traversed.). In this sense, therefore, there is no motion in
what is just being traversed. Being in motion cannot be
expressed intelligibly (na prajnapyate). The conclusion is
that there is no 'being in traverse'. Hence there is no
passage there of an activity 'motion'; that is, there is no
motion. There is no movement in what is being
traversed either.

Again, one might think that the place where one
walking actually places his feet would be just being
traversed. But this won't do, because feet are an
aggregate of minute particles. A place which is earlier
for a minute particle located in the tip of the toe falls
for it within the sector of the traversed, while for a
minute particle located in the tip of the heel that place
is later and falls within the sector of what has not been
traversed. But there is no foot apart from minute
particles and so there is no space just being traversed
apart from what has and has not been traversed. An
analysis, similar to this one of the foot, should be carried out of the spatial relationships of ahead and behind for the minute particles as well. As for what is just being traversed being half traversed, this was analysed earlier in connection with ‘being brought forth’. It is thus established that there is no motion in the sector just being traversed.

Denial of present movement

Someone might object that there is motion in what is just being traversed, as:

KALUPAHANA COMMENTARY

The positive statement: "What has moved is being moved" (gatam gamyate) does, indeed, carry the implication of a permanent substantial entity, an entity with which movement was associated in the past and which is also presently moving. Nagarjuna’s negative statement is, therefore, a denial of such an entity. Yet, this denial may be interpreted as involving the opposite view, namely, that an entity that was previously not associated with movement is at present moving, that is, the entity that is presently moving is completely different from the previous entity.

GARFIELD COMMENTARY

1. That is, if motion exists, there must be sometime at which it exists. Nāgārjuna in this opening verse considers the past and the future. This makes good sense. For motion requires a change of position, and a change of position must occur over time. But the present has no duration. So if motion were to exist, it would have to exist either in the past or in the future. But a thing that has moved only in the past’ is not now moving. Nor is a thing yet to be moved. One might, of course, suggest that there is a simple tense fallacy here - that things that were moving in the past were then in motion, that things that will move in the future will then be in motion. But this would be problematic. For that would mean that all motion would be in the past or in the future, and this could be said at any time. So there would be no time at which it would be true of any thing that it is in motion. (fn: 34. The parallels to Zeno’s paradoxes of motion, particularly that of the arrow, should be evident.) But this intuition is behind the opponent’s reply in the next verse:
Kārikā II.2

Inada (Skt):
Verse 2 (The opponent contends) Where there is movement, there is passage. There is movement also in the present passing away but not in that which has transpired nor in that which has not transpired. Thus passage must reside in the present passing away.

Jones (Skt):
[Objection:2] Where there is movement, there is motion - since movement is in what is the currently being moved, not in what has already been moved or not yet moved, motion is only in what is currently moving.

Kalupahana (Skt):
[opponent] Where there is movement, there is motion. For which reason movement is in the present moving, and not either in the moved or in the not moved, for that reason motion is available in the present moving.

McCagney (Skt):
Where there is moving there is going and it is in the present process of going.
Moving is not in what has already gone nor in what has not yet gone, but in going.

Nishijima (Skt?):
2. A motion of hands and feet at some place is just going forward at the place,
And in such a situation, the real facts of going on are there in the motion of going on.
Motions of hands and feet are sometimes not to go, and sometimes not to come.
Going just at the place is also belongs to going on.

Sprung (Skt):
2 Where there is bodily effort there is motion, and as there is bodily effort in space just being traversed, but no bodily effort in what has or has not been traversed, it follows that there is motion in space just being traversed.

English Translations

Bocking (Ch):
2v2 In the place of movement there is going
In this is the moment of going
It is neither already-gone nor not-yet-gone Therefore the moment of going goes.

Batchelor (Tb):
Where there is moving, there there is going.
Furthermore, because moving is within motion -- and is neither gone nor not [yet] gone, therefore, there is going within motion.

Doctor (Tb):
Where there is movement, there is going,
And movement is found where walking takes place,
Not where going has been, nor where it has yet to occur. Hence, going is found where walking takes place. [II.2]

Garfield (Tb):
2. Where there is change, there is motion.
Since there is change in the moving, And not in the moved or not-moving, Motion is in that which is moving.

Garfield-Samten (Tb):
2. Where there is motion, there is going.
Since there is motion in that which is being gone over, But neither where one has gone nor where one has not gone, It follows that going is in that which is being gone over.
HAGEN (paraphrase):
[opponent] Where there is movement there is motion.
For this reason, movement is in what is presently moving.

PINGALA COMMENTARY

2/2 Insofar as there is a situation in which there is an action done, going ought to exist in this. We see with our eyes that in the moment-of-going there is a situation of (karmic) activity. In the already-gone, the activity has already ceased, and in the not-yet-gone activity does not yet exist. Therefore we know that there is going in the moment-of-going.

Reply.

CANDRAKĪRTI COMMENTARY

Here bodily effort can be taken to be the lifting up and stretching out of the foot in walking. When one is walking there is motion in the very place where there is the bodily effort of lifting and stretching out the foot. This bodily effort is not possible either in space (desa) which has been traversed nor in space which has not been traversed but only in space which is just being traversed. There is, therefore, motion in space just being traversed. Where motion is directly perceived there space is just being traversed, that is, is being entered into in virtue of the activity ‘motion’; so there emphatically is motion just where space is being moved through. In these arguments the one verb root ‘move’ means first ‘to comprehend’, and second ‘to reach another point in space’ (fn 4 Candrakīrti might have added a third meaning, namely, ‘to attain’ or ‘to achieve’. The entire chapter could be taken in either of these two alternate senses. The primary reference, however, is to motion in space and the chapter has been so translated.).

But even on these suppositions there is no motion in what is just being traversed, Nagarjuna says.

KALUPAHANA COMMENTARY

If a Cartesian perspective were to generate metaphysical views such as those presented by the Sarvastivadins, one way of eliminating such metaphysics is by adopting the "Humean" perspective that emphasizes the "immediate present," without any reference to the past or the future. However, such an unrelated or independent static present may once again lead to a substantialist reductionism. The only way to get rid of such "essentialist" perspectives, both of the rationalists and of some of the empiricists, is by adopting a more "phenomenological" explanation where, instead of a "present," one speaks of "presencing." If so, present movement (gamyamana) could simply mean "motion" (gati, cesta) which is not found either in the past or the future. Having rejected the substantialist implications of the Sarvastivada in the previous verse, Nagarjuna is here speculating on the meaning of the alternative views of the Sautrantikas, who wrestled with the problems of atomic discreteness as well as the experienced continuity, only to reject them in the verse that follows.

GARFIELD COMMENTARY

2. This verse is important not only because it announces the obvious reply that motion exists in presently moving things, but because it introduces the connection between change in general and motion. Though this interpretative point is controversial, and several scholars have given widely different interpretations, (fn: 35. The Yen. Oeshe Yeshes Thap-Khas, for instance, argues that the chapter should be interpreted as about change in general; the Yen. Oen Lobzang Gyatso, on the other hand, argues that though the arguments could indeed be applied to change in general, the chapter is specifically about motion through space. The Yen. Lobzang Norbu Shastri argues that it is in fact specifically only about walking, and that any further generalization is illicit (all personal communication). I side with the Yen. Geshe Yeshes Thap-Khas on this point since Nāgārjuna offers perfectly general arguments against change in properties. And it would seem especially elegant for Nāgārjuna, who is attacking the tendency to reify, to begin with the two properties most subject to reification in Buddhist philosophy, in virtue of their universal applicability to phenomena and centrality to the Buddhist metaphysical framework - dependent arising and change. While the canonical commentaries I have consulted do not extend the argument in this direction, they do not preclude such an extension.) it is highly plausible that Nāgārjuna is calling attention to the fact that the attack on motion as an inherently existent phenomenon is a general attack on seeing change or impermanence as inherently existent. This suggests that even the properties that according to Buddhist philosophy characterize all things - being dependently arisen and being impermanent - are not themselves inherently existent. Nāgārjuna replies:
INADA (Skt):  
Verse 3 (Nagarjuna asserts) Indeed, how is it possible for the present passing away to have a coming to pass? For, it is not possible for the present passing away to be without a coming to pass.

JONES (Skt):  
[Reply:] 3 How is the movement within “what is currently moving” acceptable when the non-movement of “what is currently moving” is not?

KALUPAHANA (Skt):  
[Nagarjuna] How appropriate would be the movement of the present moving? For the non-movement in the present moving is certainly not appropriate.

MCCAGNEY (Skt):  
How would this going of the present process of going take place? Indeed, whenever there is no going, the present process of going does not take place.

NISHIJIMA (Skt?):  
3. The Action to go belongs to the state of going, Therefore how is it necessary for us to utilize the name of going? The states of going on have to be included into the two kinds, that is, going as concept, and the other is as a physical motion of going, And then it is not necessary for both the two images of the going itself and the physical motion of going, to manifest themselves at all.

SPRUNG (Skt):  
3 How can movement be intelligibly attributed to what is in traverse, as a dual movement in what is in traverse is not intelligible?

STRENG (Skt):  
3. Nagarjuna answers: How will the "act of going" (gamanam - visible activity & displacement) of "present going to" (gamyamana - ii) be produced, Since both kinds of the "act of going" (visible activity & displacement) as applied to an active process and to the activity of going through space simply are not produced (i.e. originating) in the "present going to" (ii)?

WESTERHOFF (Skt):

BOCKING (Ch):  
2v3 Why do you say that in the moment-of-going There must exist a dharma of going? When without the dharma of going There cannot be a moment-of-going?

BATCHelor (Tb):  
How can going be possible within motion? Because motion that is not going is impossible.

DOCTOR (Tb):  
Going where walking takes place, How could that make sense, When, without going, there cannot reasonably be Anyplace where walking takes place? [II.3]

GARFIELD (Tb):  
3. How would it be acceptable For motion to be in the mover? When it is not moving, it is not acceptable To call it a mover.

GARFIELD-SAMTEN (Tb):  
3. How could it be tenable For going to be in that which is being gone over? When there is no going, it is not tenable To say that there is going there.

HAGEN (paraphrase):  
[Nagarjuna] How correct is your statement when there is no movement in the present? A non-moving movement makes no sense. Consider that...
PINGALA COMMENTARY

2/3 'In the moment-of-going there is a dharma of going'; This is not so, and why? No moment-of-going can be found apart from a dharma of going. If there could be a moment-of-going which existed without a dharma of going, there would be going within such a moment-of-going, just like fruit in a dish. Moreover.

CANDRAKĪRTI COMMENTARY

You, good sir, are using the expression ‘in traverse’ (fn 5 ‘In traverse’ includes both (a) what is traversing and (b) the space being traversed.) only because of its association with motive activity, and you say there is motion there. But there is only one motive activity in virtue of which you may, if you will, use the expression ‘in traverse’ with respect to a path of movement. But to say ‘it moves’ is an additional connection with motive activity and does not make sense. ‘How can movement be intelligibly attributed to what is in traverse?’ Nagarjuna explains why not: ‘As a dual movement in what is in traverse is not intelligible.’ His meaning is that ‘in traverse’ and ‘moving’ are synonyms. ‘Dual movement’ means a movement found in two things. As ‘in traverse’ is fully absorbed by the one motive activity (garni-kriya) and as there is no second motive activity, and as to use the expression ‘there is motion’ in the absence of motion is obviously contrary to reason, so, to say ‘what is in traverse is in motion’ is not a statement with a completed sense. Such is Nagarjuna’s meaning. It is possible to say only ‘what is in traverse’ but, as there is no second motive activity, not that ‘it is in motion’.

On the other hand you may want to connect the motive activity with the motion itself. In such case there is no connection of the motive activity with what is in traverse. Nagarjuna says such a statement lacks a completed meaning.

KALUPAHANA COMMENTARY

As pointed out earlier, the statement “Man moves,” can have two possible metaphysical “deep structures.” The same could be said of the assertion, “The present moving moves.” After observing these two metaphysical implications of the statement: “movement of the present moving,” (gamyamanasya gamanam), Nagarjuna seems to take up the first alternative for examination and maintains that a present movement, conceived in such a manner, is indeed a non-movement (gamyamanam hy agamanam).

The Tibetan versions (text as well as commentaries) seem to preserve this original reading as do all the Chinese translations (see Inada, p), including Kumarajiva's. As such, the available reading in the Sanskrit version as gamyamane dvi-gamanam could prove to be a scribal error. This assumption is further strengthened by the fact that II.44 that follows provides a criticism of the first metaphysical assumption, while II.5 take the second metaphysical assumption for criticism.

GARFIELD COMMENTARY

3. The point here is that if motion is thought of both as inherently existent and as a property of the mover, then it should, as inherently existent, continue to exist. For something that is inherently existent depends for nothing on its existence, and so it cannot be deprived of the conditions of its manifestation. That is because inherent existence is existence with an essence, as an independent entity whose identity can be intrinsically specified. (See Chapter XV for more detail.) But movers come to rest. It would seem then that it would have to be appropriate to call something a mover, even when it is at rest, since inherently existing motion could not cease.
Kārikā II.4

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 4 - The assertion that the present passing away has a coming to pass results in a fallacy that the former can be without the latter. However, the present passing away does come to pass.

JONES (Skt):
[4] For whoever asserts that there is movement of “what is currently moving,” it follows that the current moving is itself without motion. But having motion means “currently moving.”

KALUPAHANA (Skt):
For him who asserts the movement of the present moving, it follows that there could be present moving without motion. [However,] the present moving, indeed, means being moved [i.e., the present moving, indeed, takes place].

MCCAGNEY (Skt):
His whose present process of going is a consequence of going, has already gone without the present process of going. But, indeed, the present process of going is going.

NISHIJIMA (Skt?):
4. A real act to go actually, is included into the state of going on, And a state of going on and a Real Act to go have adhered with each other tightly together. A state to be going on, moves following a motion of going on. Because the state of going on actually goes forward by itself exactly.

SPRUNG (Skt):
4 For one who holds that there is movement of what is in traverse, for him it must follow that what is in traverse is devoid of movement; that is, for such a one ‘what is in traverse moves’.

STRENG (Skt):
4. Having the "act of going" (gamanam - visible activity & displacement) of "present going to" (gamyamanasya - ii) has necessarily resulted in a lack of "the present going to" (ii) of the "process of going" (gati - real going process), For the "present going to" (gamyamana - ii) is the "being gone to" (gamyate).

WESTERHOFF (Skt):
II.4 For whom motion is attributed to the space presently traversed, there should be such a space without motion—but “presently traversed space” means “movement takes place there.”

BOCKING (Ch):
2v4 If someone asserts that. there is going in a moment-of-going. This person is in error. The moment-of-going exists without any separate 'going' Since the moment of going 'goes' in itself.

BATCHelor (Tb):
For whomever there is going within motion, for him it will follow that there [could be] no going within motion, because there is going within motion. (Or, following the structure and wording of v. 10: “To claim that there is going within motion implies that there could be no going within motion, because it is asserted there is going within motion.”)

DOCTOR (Tb):
For whomever there is going where walking takes place, It then follows That there is no going where walking takes place Because “going is found where walking takes place.”[II.4]

GARFIELD (Tb):
4. For whomever there is motion in the mover There could be non-motion Evident in the mover. But having motion follows from being a mover.
GARFIELD-SAMTEN (Tb):
4. For whomever there is going where one goes,
The absurd consequence would follow that
There could be a path over which one is going without going;
But wherever one goes there is going.

HAGEN (paraphrase):
The phrase “present moving” implies actual movement.
But in saying there is movement this instant, it
follows that there can be movement without motion.

PINGALA COMMENTARY

2/4 If someone says that in the already-gone and the
not-yet-gone there is no going, but that a going really exists
in the moment of going, this person is in error. If the
moment-of-going existed independently of the dharma of
going, then they would not be interdependent. Why is this?

CANDRAKĪRTI COMMENTARY

The one arguing the view that what is in traverse
has motion, must think that, as what is in traverse is a
mere name devoid of motive activity, motive activity is
adventitious to it. According to this view it must follow
that what is in traverse is devoid of motion; that is,
movement would be without motion! For such a one
what is in traverse moves. The abbreviation ‘that is’
means ‘hence’. As what is in traverse lacks motion
entirely, for one of such view it follows that it moves,
because the activity of motion is fully appropriated by
the ‘it moves’. The undesirable consequence follows,
therefore, that what is at present in traverse lacks
motion.

Again you may want to connect motion with both
what is in traverse and with movement. Even so,

KALUPAHANA COMMENTARY

In asserting the statement: "The movement of the
present moving," one is compelled to assume that present
moving is independent of motion and that the latter is
something attributed (adheyabhum) to the former. In
that case, the present moving should be without motion.

However, Nagarjuna seems to be ready to assume that "the
present moving indeed takes place" (gamyamanam hi
gamyate) without allowing for such metaphysical
implicatons.

GARFIELD COMMENTARY

4. In this verse Nāgārjuna begins his attack on the idea
that motion is a property with an existence independent of
movers. If, he asserts, one were to posit motion as such a
property that simply happened to inhere in movers, it would
follow from its independence that movers might not have it,
but instead its contrary, namely, nonmotion. But that is not
tenable. So it follows that motion can’t be thought of as an
independent property. This line of argument is continued in
the next two verses:
Kārikā II.5

गम्यामानश्य गमने प्रसक्तं गमनद्वयम्
येन तद्गम्यमानं च यथाचार गमनं पुनः॥५॥

ruò qù shì yòu qù zé yòu èr zhōng qù
yì wèi wèi qù shì èr wèi qù shì qù

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 5 - There are two aspects of coming to pass inherent in the passage of the present passing away. That is, one (which gives substance) to the present passing away and the other which is the coming to pass itself. - Note: Yamaguchi renders prasakta as fallacy; thus his translation from the Japanese would read: "There is a fallacy of asserting two kinds of coming to pass..." This is not without merits for it clarifies the position that Nagarjuna takes.

JONES (Skt):
[5] Thus, a twofold motion is entailed in the idea of the "movement of motion" - the movement by which there comes to be the "current moving," and the moving itself.

KALUPAHANA (Skt):
A two-fold movement is implied in the movement of the present moving: that by which there comes to be present moving and, again, the movement itself.

MCCAGNEY (Skt):
Two goings are implied in the going of the process of going; that by which there is a present process of going and again, the going therein.

NISHIJIMA (Skt?):
5. Being included by the Real Act to go, and being in the Real Act to go,
The two factors of the Real Act, that is, a state of going on and the Real Act to go itself,
With what kind of method have they been combined into one confirmed situation?.
Because in that case relying upon such a method, the Real Act to go has been realized again.

SPRUNG (Skt):
5 If movement is of what is in traverse it will follow that there must be two movements: one in virtue of which there is present traversing and the other in which there is motion.

STRENG (Skt):
5. Recognizing the "act of going" (visible activity & displacement) of "present going to" (ii) results in two kinds of "acts of going" (gamanadvaya - visible activity & displacement): One by which there is "present going to" (gamyamana - ii), the other which is the "act of going" (gamana - visible activity & displacement).

WESTERHOFF (Skt):
II. 5 If there is motion in the presently traversed space this eventuates two motions: that by which it is a presently traversed space, and also the motion itself.

BOCKING (Ch):
2v5 If the moment-of-going has going
Then there are two kinds of going.
One is called the moment-of-going
The other is the going-of-the-moment-of-going.

BATCHELOR (Tb):
If there were going within motion, it would follow that going would be twofold: that by which one becomes someone in motion [in a place] and [that by which one] goes in that [place].

DOCTOR (Tb):
If going took place where walking takes place,
It would follow that there are two acts of going:
One due to which there is a place with walking
And another that is the going that happens there. [II.5]

GARFIELD (Tb):
5. If motion is in the mover,
There would have to be a twofold motion:
One in virtue of which it is a mover,
And one in virtue of which it moves.

GARFIELD-SAMTEN (Tb):
5. If going were where one goes,
There would be a twofold going:
One by he who goes there,
And one in the going that is there.

HAGEN (paraphrase):
Two kinds of movement are implied by "present moving": (1) a mover and (2) inherent motion.
PINGALA COMMENTARY

2/5 If you assert that the moment-of-going has going, then this is an error which implies there are two goings. One is the moment-of-going which depends on going; the other is the going within the moment-of-going.

Question: What is wrong in there being two goings?

Reply.

CANDRAKIRTI COMMENTARY

The one movement (gamana) is the sector of the traverse (adhiva) which, by association with movement, is said to be present in traverse; the second movement, which is based on what at present is in traverse, is that in virtue of which traversing actually moves. These two movements necessarily follow if there is movement of what is in traverse.

Both movement and mover are unintelligible

If you say: ‘Let there be two movements, what is the harm’, there would be this unacceptable consequence:

KALUPAHANA COMMENTARY

This verse takes up the second metaphysical implication mentioned in the analysis of II 3, namely, ”the movement of the present moving” involves two forms of movement (dvigamanam). The first is the movement through designation (vyapadesa) and the other is the movement in itself (adhikaranabhuta). This seems to be the distinction between the phenomenal designation and the “thing-in-itself.” Further metaphysical implications of this understanding are presented in the next verse.
Kārikā II.6

Verse 6 - If the two aspects of coming to pass (are admitted), then there follow two kinds of passing (i.e., transpiring) entities. For, a passing away which is devoid of a passing entity does not take place.

INADA (Skt):
Verse 6 - If the two aspects of coming to pass (are admitted), then there follow two kinds of passing (i.e., transpiring) entities. For, a passing away which is devoid of a passing entity does not take place.

JONES (Skt):
[6] If this duality of "movement" and "motion" is accepted, then it would follow that there is a duality of movers - for apart from a mover, motion does not occur.

KALUPAHANA (Skt):
If two movements are allowed, it would follow that there would be two movers. For, separated from a mover, a movement is not appropriate.

MCCAGNEY (Skt):
Where there are two goings implied, two goers result. A goer separated from going does not happen.

NISHIJIMA (Skt?):
6. The two factors of a person to go and an Action to go itself, are so combined firmly,
And so the two parts of the firmly combined into one have been produced so hard.
Therefore, what might be produced, may become the object of so hard criticism,
And so there may be no sufficient possibility for such a production shall be realized actually.

SPRUNG (Skt):
6. Given two movements it must follow that there are two movers. Movement in default of a mover is not intelligible.

STRENG (Skt):
6. Two "goers" (gantarau) would fallaciously follow as a consequence of two "acts of going," (visible activity & displacement) Since certainly the "act of going" (visible activity & displacement) is not produced without a "goer". 

ENGLISH TRANSLATIONS

BOCKING (Ch):
2v6 If there are two dharmas of going
Then there are two goers
Because, unless there were a goer
You could not have a dharma of going.

BATCHelor (Tb):
If going were twofold, the goer also would be twofold,
because going is impossible without a goer.

DOCTOR (Tb):
When it follows that there are two acts of going,
It follows that there are two agents of going,
Because without something that goes,
It makes no sense for there to be going. [II.6]

GARFIELD (Tb):
6. If there were a twofold motion,
The subject of that motion would be twofold.
For without a subject of motion,
There cannot be motion.

GARFIELD-SAMTEN (Tb):
6. Since it would follow that there would be a twofold going,
The goer would be twofold.
For without a goer,
It is not tenable that anything goes.

HAGEN (paraphrase):
If so, there must be two movers since movement without a mover makes no sense.
Pingala Commentary

2/6 If there are two dharmas of going, then there must be two goers, and why? Because the goer exists by virtue of the dharma of going. One man, two goings and two goers? This is not right. Therefore the moment-of-going does not have going as well.

Question: Although it may be true that a goer does not have (a separate) going, yet there definitely are goers in the three times.

Reply:

Candrakīrti Commentary

6ab Given two movements it must follow that there are two movers.

Nagarjuna says why it follows that there must be two movers:

6cd Movement in default of a mover is not intelligible.

As an activity necessarily requires certain factors for its realization, either an agent or an object, the activity of motion must reside in an agent and so requires a mover (ganta). But in the very Devadatta (the ‘Mr Smith’ of Sanskrit) who is walking there is no second agent. As there are not two agents there cannot be two movements, and so it is logically impossible to say that what is just in traverse is moving.

One might suggest that even while Devadatta is standing, may he not talk, may he not look; may not the one agent be seen to engage in several activities? In this sense there will be two movements in the one mover.

This will not do. The agent is not an object, but a specific energy (sakti). From the difference of activity the difference of specific energy which engenders activity is established as well. There is after all no agent of speaking by reason of the activity of standing. If you say but the object (Devadatta) is the same, there is no objection. The object, however, is not the agent, but rather the specific energy is, and specific energies differ. Nor is someone in one locus ever observed to be the agent of two similar activities. So there cannot be two movements of one mover.

You may object that even if this is so none the less movement is directly perceived in Devadatta the mover because we say ‘Devadatta is going’. Hence movement does exist, because the mover, on which movement is based, exists as a fact.

We reply that this would be so if there were a mover as the base of movement. But there is not. Nagarjuna says how this is so.

Kalupahana Commentary

The assumption of two movements, as explained in the previous verse, will imply two movers (dvau gantarau). Here, then, is a basic assertion of Nagarjuna with regard to language, namely, that one cannot speak of, say, movement, in a vacuum, but only in relation to something that is moving (gantra). This is the nonsubstantialist approach in Buddhism which refuses to recognize a sharp dichotomy between substance (svabhava) and attribute (laksana), a dichotomy that has become an inalienable part of the essentialist traditions in Indian philosophy that are in pursuit of a truly real or ultimate entity.

Garfield Commentary

6. Here Nāgārjuna develops a reductio on a position according to which motion is a property of the mover only at the time that the mover is in motion. This might seem to be a much more plausible view than the earlier discussed view of motion as an essential property. But Nāgārjuna argues that this can’t work either. For it involves a multiplication of movements and agents of motion that is unacceptable to the proponent of such a theory. For if the motion is a property of the mover at all, both the mover and the motion must be moving. And this amounts to two separate motions. One motion - that in virtue of which the mover is a mover in the first place - is the motion posited by the theory. But if that motion were stationary, the mover would either also not be moving or it would “outrun” its motion and leave it behind. So there must also be a motion of the motion. Each of these two motions requires a subject. They can’t be the same subject because then the mover and the motion would be identical, which would be absurd. So in explaining the motion of a single individual, the opponent is stuck with two movers. This argument clearly can be understood as the start.
of an infinite regress. It is not at all clear whether Nāgārjuna
so intended it, as the context in which the argument is
formulated is one in which the consequence that two movers
emerge in the analysis of the motion of a single mover is
enough to refute the opponent. (fn: 36. The commentaries I have
consulted are silent on this issue, and there is no consensus among the
Tibetan scholars with whom I have worked regarding this issue.) But it
is important to see that once this multiplication of
explanatory motions and agents begins, it cannot be stopped,
and so this argument constitutes a perfectly general attack on
a view according to which motion is an entity associated
with movers. It is also worth noting that the argument
generalizes in other ways: It can be formulated as an
argument against a parallel analysis of change as an
independent property and, in general, as an argument against
properties as entities that inhere in subjects - a twofold
redness is required for a red shirt to be red because of the
possession of redness. So this is, in fact, a “third man”
argument.
Kārikā II.7

गन्तारः चेतितस्यृत्य गमनं नोपपदयते।
गमनेऽसति गन्ताय स नु व भविष्यति।॥७॥

若離於去者 去法不可得
以無去法故 何得有去者

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 7 - If now the coming to pass which is devoid of a passed entity does not take place, then, in turn, where will the passing entity be without the coming to pass?

JONES (Skt):
[7] If a “mover” is set apart from “motion,” then motion does not occur. And if motion does not occur, how could there be a mover?

KALUPAHANA (Skt):
If it is thought that a movement separated from a mover is not appropriate, then, when no movement exists, how could there be a mover?

MCCAGNEY (Skt):
Going and a goer do not occur as separate thoughts. Where going does not exist, where then will there be a goer?

NISHIJIMA (Skt?):
7. When someone has been criticized because of having made mistakes, The action, which has been done, usually would not become clear. Furthermore, usually the person, who has committed it, is not clear, In such situations where does the criminal exist even in future?

SPRUNG (Skt):
7 If movement is not intelligible in default of a mover, then, if there is no movement how can there be a mover?

STRENG (Skt):
7. If there is no going (gamana) (i.e. gamana equals "act of going") without a "goer" (gantara), How will the "goer" (ganta / self-existing subject) come into being when there is no "going" (gamana) (i.e. gamana equals "act of going")?

ENGLISH TRANSLATIONS

BOCKING (Ch):
2v7 If, apart from a goer
No dharma of going can be found.
Where there is no dharma of going
How can there be any goer?

BATCHELOR (Tb):
If there were no goer, going would be impossible. If there were no going, where could a goer be existent?

DOCTOR (Tb):
If there is nothing that goes,
Going makes no sense.
In the absence of any going,
How could there be one who goes? [II.7]

GARFIELD (Tb):
7. If without a mover
It would not be correct to say that there is motion,
Then if there were no motion,
How could there be a mover?

GARFIELD-SAMTEN (Tb):
7. If without a goer,
It is not tenable that there is going,
Then if there were no going,
How could there be a goer?

HAGEN (paraphrase):
If there is no motion without a mover, how could there be a mover without motion?
**PINGALA COMMENTARY**

2/7 If you isolate the goer, no (separate) dharma of going can be found. Now how can you assert, when there are no dharmas of going, that goers definitely exist in the three periods of time?

**CANDRAKĪRTI COMMENTARY**

It was stated [MMK II.6] that a movement not based in a mover was unreal. So if the mover is denied, there is no movement related to him; and then, in the absence of movement, how can there be a mover who lacks a raison d'être (nirhetuka)? Hence there is no movement.

You may object that movement does exist because we commonly say that the mover is endowed with movement (gama-nvat). Here the thought is that the mover is joined with movement and because he is so joined, he moves. If there were no movement we would not commonly say of Devadatta who moves, that ‘he moves’. If there were no staff we would not speak of ‘the bearer of a staff.’ (fn 6 A reference to the wandering mendicant whose insignia was a staff.)

We reply that there would be movement if the expression ‘he moves’ were acceptable. For,

**KALUPAHANA COMMENTARY**

This represents a simple refutation of the essentialist view involving substance and attribute. If there were to be no movement separated from the mover, then in the absence of the movement there could be no mover. The emphasis here is on the term tiraskrtya (separated). When there is no such separation and where the movement is dependent upon (prati tyā) the mover and vice versa, Nagarjuna sees no difficulty.

**GARFIELD COMMENTARY**

7. Nāgārjuna is here emphasizing the codependence of motion and the mover. If there are no movers, there is no motion. If there is no motion, there are no movers. This has import at both the conventional level and with respect to any discussion of the inherent existence of either the mover or motion. At the conventional level, it means that any analysis of either motion or the mover that leaves the other out, or that does not involve codependence, will fail. Neither can be established as an independent basis for the analysis of the other. But it also means that neither, therefore, can be thought to inherently exist since to exist inherently would be to exist independently.
Kārikā II.8

गन्ता न गच्छति तावदगन्ता नैव गच्छति।
अन्यो गच्छतुरगच्छ व कस्ततोऽयो हि गच्छति॥८॥

去者則不去 不去者不去
離去不去者 無第三去者

�ंता न गच्छति तावद गच्छतो नैव गच्छति।
अन्यो गच्छतुर गच्छ व कस्ततोऽयो हि गच्छति॥८॥

lí qù bù qù zhē wù dì sān qù zhē

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 8 - Indeed, a passing entity does not come to pass and
neither does a non-passing entity. Apart from these, how
could there be a third (type of) entity coming to pass? -
Note: A non-passing entity refers to an entity which is not
involved in the coming to pass process.

JONES (Skt):
[8] The mover does not move, just as a non-mover does not
move and other than a mover or non-mover, what third
possibility is there?

KALUPAHANA (Skt):
As much as a mover does not move, a non-mover too does
not move. Other than a mover and a non-mover, what
third party moves?

MCCAGNEY (Skt):
So long as a nongoer does not go, a goer also does not go.
Other than a goer and a nongoer, who is the third that goes?

NISHIJIMA (Skt?):
8. An Action to go does never go ahead,
And similarly an Action not to go does never go ahead at all.
A different person other than who goes, does never go,
And then what kind of the third person, actually goes?

SPRUNG (Skt):
8 The mover does not move, nor does the non-mover
move. What third thing, neither mover nor non-
mover, moves?

STRENG (Skt):
8. The "goer" does not go (move); consequently a "non-
goer" certainly does not go (move). What third
possibility goes (moves) other than the "goer" and
"non-goer"?

ROBINSON (Skt):
A goer does not go, and a non-goer does not go; what third
one other than goer and non-goer goes?

BOCKING (Ch):
2v8 A goer does not go
And a non-goer does not go.
Apart from goer and non-goer.
There is no third goer.

BATCHelor (Tb):
When a goer does not go, a non-goer cannot go; what
third one other than a goer and a non-goer could go?

DOCTOR (Tb):
One who goes does not go,
Nor does one who does not go.
Other than goers and nongoers,
What third party could be going? [II.8]

GARFIELD (Tb):
8. Inasmuch as a real mover does not move,
And a non-mover does not move,
Apart from a mover and a non-mover,
What third thing could move?

GARFIELD-SAMTEN (Tb):
8. Now, inasmuch as a goer does not go,
And a non-goer does not go,
Apart from a goer and a non-goer
What third thing could go?

HAGEN (paraphrase):
A mover does not move, nor does a non-mover move.
Apart from a mover and a non-mover, what third
party moves?
PINGALA COMMENTARY

2/8 There is no goer. Why is this? If there were goers, then there would be two categories, either goers or non-goers. Apart from these two, there can be no third (category of) goer.

Question: What is wrong in saying that a goer goes?

Reply.

CANDRAKĪRTI COMMENTARY

The thought is, that, to say ‘he moves’ there must be a mover. In the first alternative the mover does not move. In what sense he does not move Nagarjuna will expound in the three following verses. But neither does the non-mover (aganta) move; for what is called a non-mover is devoid of movement. Rut the word ‘moves’ takes its meaning from its connection with the activity of motion. If such is a non-mover how will he move? On the other hand, if he moves, he will not be a non-mover. If you think something quite apart from these two moves, it is not so. What third thing unconnected with a mover or a non-mover could be thought of as ‘moving’. Hence there is no movement.

You may object that it is not a non-mover which moves, nor one other than mover and non-mover, but rather it is the mover itself. But this too is false (asat). Why? Because,

KALUPAHANA COMMENTARY

Nagarjuna’s analysis now moves from the present movement to the present mover. The possible metaphysical implications he perceived in the statement “present moving moves,” are not very different from those that may be involved in the assertion that a “present mover moves” (ganta gacchati). Yet, the question raised is in a slightly different context from that embodied in II. 1 which refers to the past, that is, the moved or the one who has moved (gata), whereas the present verse relates to a present mover (ganta). It shows that metaphysical interpretations can arise not only regarding the past and the future but also in relation to the present.

GARFIELD COMMENTARY

8. Here the terms “mover” and “nonmover” must be understood in the context of the previous arguments. Nāgārjuna is clearly talking about entities that are essentially in motion or in nonmotion. He has argued that we cannot think of a thing in motion as a thing whose nature is to move. And clearly a thing whose nature is not to move cannot be in motion. So if motion is thought of as a property that is either part of the nature of a thing or incompatible with a thing’s nature, we are left with the conclusion that there is no motion. And so we have a philosophical problem: How is ordinary motion (and change) possible? Nāgārjuna emphasizes this in the following verses:
Kārikā II.9

गन्ताता तावदगच्छतीति कथमेवोपपत्स्यते।
गमानेन विना गन्ताता यदा नैवोपपद्यते॥९॥

若言去者去，云何有此義。
若離於去法，去者不可得。

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 9 - Indeed, how is it (possible) for a passing entity to come to pass when, separated from a coming to pass, a passing entity does not take place?

JONES (Skt):
[9] Indeed, how can the idea “insofar as there is mover, it moves” be appropriate when there is no mover without motion?

KALUPAHANA (Skt):
Indeed, how appropriate will be the view that a mover moves? For, a mover without movement is certainly not appropriate.

MCCAGNEY (Skt):
How does it just happen that the “goer as much as goes”?
When is there a goer where there is no going that takes place?

NISHIJIMA (Skt?):
9. A fact that a motion to go moves even a bit,
Can never occur even in future at all.
If we are relying upon only our Action to do without any personal decision to work,
Then any kinds of phenomena do not manifest themselves at all for ever.

SPRUNG (Skt):
9 How will it be intelligible that ‘the mover moves’, as the mover himself is not intelligible without movement?

STRENG (Skt):
9. It is said: "The 'goer' goes" (moves) How is that possible, When without the "act of going" (gamana - visible movement) no "goer" is produced?

WESTERHOFF (Skt):
II.9 How suitable is it to say “a mover moves,” as far as a mover without motion is certainly not suitable?

BOCKING (Ch):
2v9 If you talk about a goer going.
What does this mean
Where without a dharma of going,
There can be no goer?

BATCHelor (Tb):
When a goer is impossible without going, then how is it possible to say: “a goer goes”?

DOCTOR (Tb):
When, in the absence of going,
A goer does not make sense,
The statement “going is engaged in by the one who goes”— How could that possibly make sense? [II.9]

GARFIELD (Tb):
9. When without motion,
It is unacceptable to call something a mover,
How will it be acceptable
To say that a mover moves?

GARFIELD-SAMTEN (Tb):
9. Now, when without going,
It is untenable to call something a goer,
How could it be tenable
To say that a goer goes?

HAGEN (paraphrase):
How can it be that a mover moves? A mover without movement doesn’t make sense.
PINGALA COMMENTARY

2/9 If you say that a goer definitely exists, and he employs a dharma of going, this is not correct, and why? Because no goer can be found separately from a dharma of going. If a dharma of going definitely existed, separate from a goer, then the goer could employ the dharma of going, but this is not what happens.

Further.

CANDRAKĪRTI COMMENTARY

In the statement ‘the mover moves’ there is only one activity of motion in virtue of which we say ‘he moves’. What we call the mover is not a second activity of motion. A mover without movement is not moving, so if the mover is not possible it will not make sense to say ‘the mover moves’. One may say ‘moves’ if one wishes to, but ‘the mover’ is not possible and so the entire sentence does not make sense.

Perhaps the mover is by nature mobile, being joined with motion. Here as well Nagarjuna says that, because there is no second activity of motion, the expression ‘the mover moves’ is not acceptable.

KALUPAHANA COMMENTARY

This again is a positive assertion of Nagarjuna, who would be willing to speak of a movement in a mover, without having to assume that there are two entities involved here, namely, a mover and a movement. For him, the mover and movement are dependent or contingent; one cannot speak of the one without implying the other.

The statement, "A mover without movement is certainly not appropriate," is the ultimate refutation of a substantialist assumption that there can be a real entity about whom or which certain attributes can be predicated, the entity and the attributes being completely different.
Kārikā II.10

INADA (Skt):
Verse 10 - If it is asserted that a passing entity comes to pass then a fallacy would result in that the entity could be separated from the coming to pass. (And yet) a passing entity requires the (condition of) passing away.

JONES (Skt):
[10] For one who entertains the proposition “the mover moves” and looks for the motion of a mover, it follows that there is a mover without motion.

KALUPAHANA (Skt):
For him who entertains the view: “A mover moves,” and who looks for the movement of a mover, it follows that there is a mover without movement.

MCCAGNEY (Skt):
His whose position implies “the goer goes” seeks going and a goer where the going is without a goer.

NISHIJIMA (Skt?):
10. The opinion that one of the two between the person to go and the Action to go, goes, Has too much one-sided attitude in decision of selecting that or this.
In the action to go, there is no person, who acts.
Therefore it might be hopeful that the person, who acts, likes the action to do so much.

SPRUNG (Skt):
10 For one holding the view that the mover moves, for him, thinking that movement belongs to the mover, it must follow that the mover is without movement.

STRENG (Skt):
10. Those who hold the view that the "goer" "goes" (moves) must falsely conclude That there is a "goer" without the "act of going" (visible activity & displacement) since the "act of going" (visible activity & displacement) is obtained (icchata) by a "goer."

WESTERHOFF (Skt):
II.10 For the one who holds the position that a mover moves and who is looking for the motion of the mover, there is a mover without motion.

ENGLISH TRANSLATIONS

BOCKING (Ch)
2v10 If a goer has going,
Then there are two sorts of going. 
One is the going of the goer.
The other is the going of the dharma of going.

BATCHelor (Tb):
To claim that a goer goes implies that there could be a goer who does not go, because it is asserted that a goer goes.

DOCTOR (Tb):
For those who hold that going is engaged in by one who goes It would then follow that there is One who goes in the absence of going, For it is asserted that going is performed by one who goes. 
[II.10]

GARFIELD (Tb):
10. For him from whose perspective a mover moves, There would be the consequence that Without motion there could be a mover.
Because a mover moves.

GARFIELD-SAMTEN (Tb):
10. For him according to whose position a goer goes, The absurd consequence would follow that There could be a goer who does not go; Because it is maintained that that a goer goes.

HAGEN (paraphrase):
To believe that a mover moves, is to believe that there can be a mover without movement.
PINGALA COMMENTARY

2/10 If you say that a goer employs a dharma of going, then this involves two errors, for there is one goer but two goings. One; by means of the dharma of going, the goer is established (as a goer). The other; by means of the goer the dharma of going is established. The goer, already established, employs the dharma of going. This is not correct. Therefore, when you previously asserted that in the three periods of time there definitely exist goers, and they who employ dharmas of going, this is not right. Again;

CANDRAKĪRTI COMMENTARY

For one holding the view that it is the mover who is joined with the activity of motion, for him, thinking that movement belongs to the mover because of the expression ‘the moving mover’, the statement ‘the mover moves without movement’ would have to follow, as there is no second activity of motion. Hence it makes no sense to say ‘the mover moves’. In the phrase ‘a mover without movement’, the word ‘mover’ has the meaning ‘to move’.

Perhaps one thinks that in the sentence ‘the mover moves’ motion is joined with both parts. This too is futile.

KALUPAHANA COMMENTARY

A mover without movement is an entity without an attribute. For the essentialist tradition, an entity is an entity "in itself" without any attributes, of which attributes are predicated. An "entity-in-itself" thus becomes indefinable and indescribable. Nagarjuna has no interest in such speculations. No predication is meaningful without the predicated. These are mutually dependent (prati tya) and not independent (a-prati tya).

GARFIELD COMMENTARY

10. These verses recapitulate the argument in II: 4 and II: 7. If we simply regard motion and mover as independent phenomena, we are forced to the absurd consequence that either could be present without the other.
Kārikā II.11

gamane dve prasajyete gantā yady uta gacchati |
ganteti cājyate yena gantā san yac ca gacchati ||11||

ruò wèi qù zhě qù shì rén zé yòu jiù |
lí qù yòu qù zhě shuí qù zhě yòu qù |
| gal te ’gro po ’gro gyur na || ’gro ba gñis su thal ’gyur te |
| gaṅ gis ’gro por mñon (7)pa daṅ || ’gro por gyur nas gaṅ ’gro ba’o |

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 11 - If again it is asserted that the passing entity comes to pass then (another) fallacy would result in two types of coming to pass. One type would exhibit the fact of a passing entity and the other the coming to pass in virtue of being a passing entity.

JONES (Skt):
[11] In fact, if the mover moves two motion follow: that by which the mover is called “a mover,” and that by which a mover then moves.

KALUPAHANA (Skt):
If a mover were to move, then it would follow that there will be two movements: one in virtue of which he is spoken of as a mover, and the other in terms of which an existing mover is said to move.

MCCAGNEY (Skt):
If a goer goes, that results in two goings, one called “goer” and the other an existing goer who goes.

NISHIJIMA (Skt?):
11. In the real act to go, the two factors of a real act to go and a physical motion to go are enormously combined with each other.
And in that case a person, who goes, is also emphasized actually. In such a situation a person, who likes to get the position of the job enormously,
Will get the job relying upon the adequate method to go on.

SPRUNG (Skt):
11 If it is the mover who moves there will necessarily be two movements: the one in virtue of which we say ‘mover’ and, the mover being given, the other in virtue of which we say ‘he moves’.

STRENG (Skt):
11. If the "goer" "goes" (moves), then two acts of going (visible activity and displacement) erroneously follow; One is that by which the "going on" (ganta) is designated, and the second is the real "goer" (ganta / self-existing subject) who "goes"(moves).

WESTERHOFF (Skt):
II.11 Also, if the mover moves, two motions would be implied: that in virtue of which it is manifested as a mover, and, it being a mover, that [motion] with respect to which it moves.

BOCKING (Ch).
2v11 If someone says that a goer goes. This person is in error.
(He makes) the goer separate from going, And asserts that the goer has going.

BATCHelor (Tb):
If the goer goes, it would follow that going would be twofold: that which reveals* the goer and that which goes once [he] has become a goer.

DOCTOR (Tb):
If going is engaged in by the one who goes, It follows that there are two acts of going: One that characterizes the one who goes, And another going in that capacity, [II.11]

GARFIELD (Tb):
11. If a mover were to move, There would be a twofold motion:
One in virtue of which he is a mover, And one in virtue of which the mover moves.

GARFIELD-SAMTEN (Tb):
11. If a goer were going, There would be the absurd consequence of a twofold going: One in virtue of which he is manifest as a goer, And one in virtue of which, having become a goer, he goes.

HAGEN (paraphrase):
If a mover moved, then there would be two movements--the mover and the moved. [A (1) mover (2) moved.]
PINGALA COMMENTARY

2/11 If someone teaches that a goer can employ a dharma of going, this person makes the error (of saying that) the goer exists separately from the dharma of going. Why is this? To teach that a goer can employ a dharma of going, implies that the goer existed first and the dharma of going later on, but this is not correct. Therefore, there are no goers in the three periods of time. Further, if (both) going and goer definitely existed, they would have to have a beginning, but if you search for such a beginning in the three periods of time you cannot find it. Why is this?

CANDRAKĪRTI COMMENTARY

The movement in virtue of being joined with which one says ‘mover’ is referred to as the one movement; the mover existing, there is the movement in virtue of which he ‘moves’, that is, the activity of motion he carries out (karoti). These are the two movements which necessarily follow. The necessary consequence (prasanga) that there must be two movers should be pointed out, as this fallacy (dusana) was previously. Hence it will not do to say ‘the mover moves’.

You may object that, even though this be so, none the less, because we do in fact say ‘Devadatta goes’ movement does exist. It is not so. The only thing based in Devadatta is the enquiry how a mover who exists can move, or again how a non-mover can move or something quite separate from both. As none of these alternatives is intelligible the point is quite irrelevant.

Denial of the commencement of movement

You may object that there is movement because its commencement (arambha) is a fact (sadbhavat). The thought here is that Devadatta, by ceasing to be at rest, commences to move. But one does not commence something which does not exist like a woollen garment made from tortoise hair (a common equivalent of the ‘married bachelor’).

We reply that there would be movement if its commencement existed. For,

KALUPAHANA COMMENTARY

This is the converse of II. 5. The statement: "A mover moves" would imply two movements: the first is a mover by designation (vyapadesa) and the second, the really existent (sad) mover or "the mover-in-itself." Whether Nagarjuna is prepared to maintain that all designations are so wild in their implications or whether such is the case with only some of them needs to be carefully examined, as in the case of concepts of causal dependence.

GARFIELD COMMENTARY

11. This last verse recapitulates the important argument in II: 6 in preparation for the attack on the possibility of the beginning and end of motion. The next few verses are reminiscent both of Zeno of Elea and Sextus Empiricus:
Kārikā II.12

INADA (Skt):
Verse 12 - There is no commencing of passing away in that which has transpired nor in that which has not transpired. Neither is there a commencing in the present passing away. Wherein, then, does it commence (to pass away)?

JONES (Skt):
[12] Motion does not begin in what has already been moved, nor does it begin in what is not moving, nor does it begin in what is currently moving - where then does it begin to move?

KALUPAHANA (Skt):
Movement is not begun in the moved, nor is it begun in the not moved. Neither is it initiated in the present moving. Wherein then movement initiated?

MCCAGNEY (Skt):
To go does not begin in what has already gone, the goer does not begin in what has not yet gone.
To go does not begin in the present process of going. Where does it begin?

NISHIJIMA (Skt?):
12. It is impossible that a real act to go might be born in a memory of having gone at all,
And it is also impossible that a real act to go might be born in a supposition in future.
And it is also impossible that a real act to go might actually realize itself in recognition of going on,
Therefore in any case it is perfectly impossible for us to fix the time of starting a Real Act to go actually.

SPRUNG (Skt):
12 Motion (gantum) does not commence in what has been traversed, motion does not commence in what has not yet been traversed, motion does not commence in what is in traverse. Where does it commence?

STRENG (Skt):
12. The "state of going to" (gatum) is not begun in "that which is already gone to" (gatam - iii), nor in "that which is not yet gone to" (agatam - i); Nor is the "state of going to" begun in "present going to" (gamyamana - ii). Where then is it begun?

BOCKING (Ch):
2v12 In the already-gone there is no beginning
In the not-yet-gone there is no beginning
And in the moment-of-going there is no beginning.
So where could this beginning be?

BATCHELOR (Tb):
If a beginning of going does not exist in what has gone, [if] a beginning of going does not exist also in what has not [yet] gone [and if] there does not exist a beginning within motion, wherein is a beginning of going made?

DOCTOR (Tb):
Going does not begin where it has been,
Nor does it begin where it has yet to occur.
Going does not begin where walking takes place,
So where does going begin? [II.12]

GARFIELD (Tb):
12. Motion does not begin in what has moved,
Nor does it begin in what has not moved,
Nor does it begin in what is moving.
In what, then, does motion begin?

GARFIELD-SAMTEN (Tb):
12. Going does not begin where one has already gone;
Nor does going begin where one has not yet gone;
Nor does it begin where one is going.
Where, then, does going begin?

HAGEN (paraphrase):
Movement does not begin in what has moved, in what has not moved, or in what is moving. Where does it begin?
PINGALA COMMENTARY

2/12 Why are there no beginnings in the three times?

CANDRAKĪRTI COMMENTARY

If there were commencement of movement it would have to be in the sector of the path of motion traversed, or not yet traversed, or just in traverse. Movement does not commence in the sector traversed as it is so called because it is devoid of the activity of motion. If movement commences there it would for that reason not be already traversed because past and present are contraries (virodhat). Movement cannot commence in what has not yet been traversed because future and present are contraries. Nor in what is in traverse because that does not exist, because it would follow that there were two motions, and because it would follow that there were two movers. Thus Nagarjuna says that nowhere can the commencement of movement be observed: ‘Where does motion commence?’ In what further way movement is not possible Nagarjuna expounds thus:

KALUPAHANA COMMENTARY

Nagarjuna now moves on to the question regarding the origin of movement, a question that has left a trail of metaphysical speculations from the very early period of philosophical thinking. Metaphysical speculations regarding time, leading to a theory of existence analysed in terms of discrete momentary events into the past, present and future, coupled with the problem of explaining the origin of each moment, a scenario created by the Abhidharma interpreters, provided Nagarjuna with the opportunity to utilize a method comparable to Zeno’s paradoxes in order to expose the meaninglessness of such metaphysics.
Kārikā II.13

INADA (Skt):
Verse 13 - There is no present passing away prior to the commencement of coming to pass and also in that which has transpired. How could there be a commencement of coming to pass in that which has not transpired?

JONES (Skt):
[13] Prior to the beginning of motion, there is neither the "current moving" nor the "prior moving" in which motion might begin - how could there be motion in what is not yet moved?

KALUPAHANA (Skt):
Prior to the commencement of movement, there is neither the present moving or the moved from which movement is initiated. How could there be movement in the not moved?

MCCAGNEY (Skt):
Prior to the beginning of going, there is neither a present process of going nor what has already gone. Where is there a beginning of going in what has not yet gone? Where is the going?

NISHIJIMA (Skt?):
13. If the start of real act to go hasn't become going on, It is impossible for the state of going to appear at all, and it is also impossible for the act of having gone to stop. In such a situation it is necessary for the Real Act to go should be done actually, And it is completely impossible for the real act not to be done at all.

SPRUNG (Skt):
13 Prior to the commencement of movement there can be no present nor past traversing where movement could begin. And how could it begin in what has not yet been traversed?

STRENG (Skt):
13. "Present going to" (ii) does not exist previous to the beginning of the "act of going," (visible activity and displacement) nor does "that which is already gone to" (iii) exist where the "act of going" (visible activity and displacement) should begin. How can the "act of going" (visible activity and displacement) begin in "that which is not yet gone to" (i)?

BOCKING (Ch):
2v13 Until it has begun, there is no moment--of-going. And likewise, there is no already--gone. These two ought to have beginnings how can there be a beginning of the not-yet--gone?

BATCHELOR (Tb):
Before a beginning of going, there is not any motion or anything which has gone wherein going could begin. How can going exist in what has not [yet] gone?

DOCTOR (Tb):
Before going has been initiated, There is no place where walking occurs or has taken place Upon which going could begin. And how could there be going where there is none yet?

GARFIELD (Tb):
13. Prior to the beginning of going, there is no beginning of going or in the gone. How could there be motion in the not-gone?

GARFIELD-SAMTEN (Tb):
13. Prior to the beginning of going, there is a beginning of going neither Where one is going nor where one has gone. How could there be going where one has not yet gone?

HAGEN (paraphrase):
Before movement begins there is neither movement nor the moved. And how could there be movement in what is not moving?
CANDRAKĪRTI COMMENTARY

The thought is that so long as Devadatta is unmoving in one place he does not begin to move. Before he commences movement there is no sector of a path of movement (adhva-jata) which is being traversed nor a sector already traversed where movement could commence. As what is in traverse and what has been traversed do not exist, movement cannot begin in them. You might suggest that, even though prior to the commencement of movement there is no present nor past movement, none the less there is the sector not yet traversed and it is there that movement would begin.

We reply: How could it begin in what has not yet been traversed? The not yet traversed is the sector where the activity of motion has not yet arisen, has not yet begun. That movement should commence there is incoherent (asambaddha) Nagarjuna says: ‘How can there be movement in what is not yet traversed?’

If you suggest that, although movement does not begin in what has been, what has not been and what is being traversed, these distinctions themselves exist, because, if there were no movement, they would have no meaning.

We reply that there would be movement if these distinctions existed. You are supposing that if an activity of motion has commenced, where that activity of motion has ceased has been traversed, where it is present is in traverse and where it has not arisen is not yet traversed. As, however, there is no commencement of movement, so

KALUPAHANA COMMENTARY

Agate gamanam kutah ("How could there be movement in the not moved?") seems to be the refutation of the idea of an "unmoved mover" at a microcosmic or phenomenal level. The interpreters of the Abhidharma were probably aware of the Buddha's reluctance to discuss the absolute origin of the universe. Yet their way of handling the Abhidharma analysis, especially their understanding of change as momentary destruction (ksanabhanga), left them sometimes with four discrete moments (i.e. origin, stash, decay, and destruction recognized by the Sarvastivadins), sometimes with three (i.e., origin, stasis, and destruction, as in the case of the Theravadins) and sometimes with two (i.e., origin and destruction, as it was the case with the Sautraantikas). In all these instances, each preceding moment had to account for the succeeding moment that is different.

GARFIELD COMMENTARY

13. These two verses are alternative formulations of the same argument: If there is motion, it must begin sometime. But that moment is inconceivable. For motion doesn’t begin in a stationary thing. And once a thing is in motion, it is too late. It can’t always have begun in the past or be yet to begin, and there simply isn’t time to go anywhere in the present.
Kārikā II.14

INADA (Skt):
Verse 14 - As any form of the commencement of coming to pass cannot be seen, how could that which has transpired, the present passing away, and that which has not transpired be conceivable?

JONES (Skt):
[14] And when the beginning of motion is not seen, how can we posit “the moved,” “the currently moving,” and “the not yet moved”?

KALUPAHANA (Skt):
When the commencement of movement is not being perceived in any way, what is it that is discriminated as the moved, the present moving, or the not moved?

MCCAGNEY (Skt):
Who has already gone, the present process of going, who is not yet gone is presumed. The beginning of going is not in any way seen.

NISHIJIMA (Skt?):
14. How is it possible for having gone to be the same as going on actually? How is it possible for having gone to be the same as not having gone, or how is it for having gone to be replaced with others? The idea that there might be something, which cannot be seen, may exist as the first step, But the all cases actually belong to the Real Action to go totally.

SPRUNG (Skt):
14 What past, present and future movements are being presumed, as the beginning of movement is not observed in any of these ways?

STRENG (Skt):
14. It is mentally fabricated what is “that which is already gone to” (gatam - iii), "present going to" (gamyamana - ii) and "that which is not yet gone to" (agatam - i); Therefore, the beginning of the "act of going" (visible activity and displacement) is not seen in any way.

ENGLISH TRANSLATIONS

WESTERHOFF (Skt):
II.14 How are the [space] moved over, the presently traversed and the one yet to be moved over differentiated when the beginning of motion is indeed nowhere perceived?

BOCKING (Ch):
2v14 No (already) gone and no not-yet-gone And moreover, no moment of going; If all these have no beginnings. Why then do we distinguish them?

BATCHelor (Tb):
If a beginning of going is simply not apparent in any way, examine: what has gone? what is motion? what has not [yet] gone?

DOCTOR (Tb):
Since we never witness a beginning of going How can we conceive of the traversed, Of what is being traversed, And what has yet to be traversed? [II.14]

GARFIELD (Tb):
14. Since the beginning of motion Cannot be conceived in any way, What gone thing, what going thing, And what non-going thing can be posited?

GARFIELD-SAMTEN (Tb):
14. Since the beginning of going Cannot be perceived in any way, What over which one has gone, what over which one is going, And what over which one has yet to go, can be conceived?

HAGEN (paraphrase):
Since the beginning of movement is not perceived, what can be thought of as past, present, or static movement?
2/14 If a person has not yet started out, then there is no moment of going, and likewise there is no already-gone. If there were beginnings then they would have to be located in two places, namely, the moment-of-going or the already-gone. These two are both wrong since, at the time when a person has not yet gone, there has not yet been any beginning. So how can there be a beginning in the not-yet-gone? If there is no beginning, there is no going. If there is no going, there is no goer; so how can there be an already-gone, a not-yet-gone and a moment of going?

Question. Even if there is no going and no goer, surely there is (the antithesis) resting, and those who are at rest?

Reply.

CANDRAKĪRTI COMMENTARY

If no beginning of movement is observed what delusive (mithya) tripartite path of movement is being presumed (vikalpyate)? How can movement be the basis for such terminology? This is absurd (ayuktam).

Denial of rest

You may object that movement is a fact because its opposite (pratipaksa) is a fact. That of which there is an opposite exists, as in the case of light and darkness, this side and other side, doubt and certainty. And there is an opposite of movement, namely rest (sthanam).

We reply that there would be movement if there were its opposite, rest. But how could rest, so conceived, be supposed to apply to a mover, a non-mover or what is other than these two? Nagarjuna says that this does not make sense in any way.

KALUPAHANA COMMENTARY

Unless the metaphysics referred to above is kept in mind, it would be easy to assume that this verse represents a refutation of any form of discrimination of events as past, present, or future. On the contrary, what is being emphasized here is that the commencement of movement, as explained in the previous verses, is not perceived at all anywhere (sarvatha). As such, a question is raised regarding the validity of discriminations or thoughts regarding the past, present, and future, which are based upon that particular conception of the commencement of movement (gamanasya arambha). Nagarjuna is not claiming that there is only one way in which commencement of movement can be explained; he is merely refuting the metaphysical explanation of movement and its commencement.

GARFIELD COMMENTARY

14. After having emphasized this point, Nāgārjuna points out that all that has been said about motion (and hence implicitly about change) applies, mutatis mutandis, to rest (and hence implicitly to stasis). Things that are in motion cannot be simultaneously at rest. But to say that a stationary thing is at rest, where rest is conceived as a property or entity having independent existence, would involve us in the same paradoxes encountered above: The stasis itself would have to be either in motion or at rest. If in motion, then the static thing would have to be in motion, which is contradictory. But if at rest, then it must be at rest in virtue of possessing stasis, and we are off on the same regress:
PINGALA COMMENTARY

2/15 If there is resting, and those who rest, these ought to be either goers who are resting, or non-goers who are resting, or, apart from these two, some third who is resting, but these are not correct. A goer is not at rest, since a goer has not yet stopped. Going means the opposite of resting. A non-goer likewise is not at rest, and why? It is because of the cessation of the dharma of going that resting exists, so where there is no going, there is no resting. Apart from the goer and non-goer there is no further third one who is at rest. If there were a third type who was at rest, he would have to be found amongst either the goers or the non-goers. Therefore, you cannot say that a goer is at rest.

Further.

CANDRAKĪRTI COMMENTARY

In what way a mover does not come to rest (tisthati) (fn 7 Or ‘is at rest’; this is as much an act as movement is.) is explained in the next kārikā. The non-mover does not come to rest either because he is by nature at rest. What would be the purpose of his coming to rest a second time? In virtue of one ‘coming to rest’, he is a non-mover; in virtue of a second he is ‘at rest’. This involves the necessary consequence of two acts of resting and of two bodies resting. There is no third body quite separate from a mover and a non-mover, a fallacy pointed out earlier.

You may object that it is not the non-mover who rests, nor a body other than mover and non-mover, but rather it is the mover himself who rests.

It is not so, for,

KALUPAHANA COMMENTARY

To say that a mover is stationary (ganta tisthati) is self-contradictory. To maintain that a non-mover is stationary (aganta tisthati) is tautological. Looking for something or someone (svabhava, pudgala) to which/whom the characteristics of motion and stasis can be attributed, one merely ends up conceiving of a "hare's horn" (sasa-visana) or "crow's teeth" (kaka-danta). Such is the essentialist enterprise. This certainly does not mean the rejection of the empirical notion of relativity or dependence of motion on stasis and vice versa, as in the case of short and long. It is indeed a simple refutation of the view that there are independent entities to which the characteristics of motion and stasis can be attributed.

290
Kārikā II.16

去者若當住 云何有此義
若當離於去 去者不可得

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 16 - Indeed, how is it (possible) for a passing entity to abide when, separated from a coming to pass, a passing entity does not take place?

JONES (Skt):
[16] How will the idea “insofar as there is a mover, it is stationary” occur when a mover without motion does not occur?

KALUPAHANA (Skt):
How appropriate would it be [to say]: “A mover, at the moment, is stationary”? For a mover without movement is not appropriate.

MCCAGNEY (Skt):
How can [the statement] “a goer who stays” obtain?
A goer without going just never happens.

NISHIJIMA (Skt?):
16. A fact that a motion to go has tendency to be stagnant even a little,
Does never manifest itself even in future at all.
Without a motion to go, relying upon only the Real Action to go, The Real Action can never occur at all even at any time.

SPRUNG (Skt):
16 How will it be reasonable to say ‘the mover comes to rest’ as a mover without movement is not intelligible?

STRENG (Skt):
16. It is said that a "goer" continues to be a "goer". But how can that be possible, Since a "goer"(ganta / self-existing subject) lacking the "act of going" (gamanam - visible activity and displacement) is simply not produced?
PINGALA COMMENTARY

2/16 You say that a goer is at rest but this is not correct, and why? No goer can be had apart from a dharma of going. If the goer resides in the characteristic of going, then why do you suppose that he is at rest, since going and resting are opposed to each other?

Further.

CANDRAKīRTI COMMENTARY

If it is said that the mover comes to rest, then there can be no movement as the opposite of rest; in the absence of movement the term mover does not obtain; hence to say the mover is at rest or comes to rest is unintelligible.

You may object that movement is a fact because its cessation (nivrtti) is a fact. The thought is that the ceasing of motion is the commencement of rest. But if there were no movement it could not cease.

We reply that there would be movement if its cessation were a fact, but it is not. For,

KALUPAHANA COMMENTARY

The argument in the previous verse is made very clear by the present. Empirically, a “mover” without motion is inconceivable, just as a pure entity (svabhava) without function or characteristics is empirically meaningless. As such, the statement: “A mover, at the moment, is stationary,” can be made assuming that the entity that previously possessed the characteristic of motion (gamana) has now abandoned it in order to assume a different characteristic, namely, stasis. The Sarvastivada theory of prapti and aprapti was formulated to explain such “possession” and "non-possession" after they assumed the metaphysical notion of a substance or "pure being" (svabhava) (see Poussin, AK ii.36).

GARFIELD COMMENTARY

16. And, in the same fashion, all that applies to the initiation of motion applies mutatis mutandis, to its cessation:
**Kārikā II.17**

na tiṣṭhate gamyamānāṁ na gatāṁ nāgatād api

gamanam sampravṛttiś ca nivṛttiś ca gateḥ samā ||17||

qù wèi qù wú zhù qù shí yì wú zhù

**ENGLISH TRANSLATIONS**

INADA (Skt):
Verse 17 - There is no abiding (nature) in the present passing away, in that which has transpired and in that which has not transpired. (Otherwise) the coming to pass, arising, and cessation would be identical with (the concept of) passage.

JONES (Skt):
[17] One does not stop from moving, nor from having moved, nor from not having moved. The "beginning of motion" and the "ending of motion" are to be analyzed the same way as motion.

KALUPAHANA (Skt):
One does not come to be stationary because one is either moving, or has moved, or has not moved. Movement, commencement and cessation (of movement) are all comparable to motion.

MCCAGNEY (Skt):
He does not stay because [the goer] is either presently going, has already gone, or has not yet gone.

Going is the same as origination, and already having gone is the same as cessation.

NISHIJIMA (Skt?):
17. Leaving a state of going on, the stagnation does never exist, And leaving from having gone, or leaving from not having gone, the stagnation does never exist also.

When a Real Action to go has manifested itself, Then in the case of stopping Action, or in the case of going to act, situations are perfectly balanced.

SPRUNG (Skt):
17 One does not come to rest either from present, past or future movement. Movement, commencement and cessation are the same as for motion.

STRENG (Skt):
17. The "goer" does not continue to be a goer as a result of "present going to" (ii) or "that which is already gone to" (iii) or "that which is not yet gone to," (i) For then the act of going (gaman - visible activity and displacement) would be origination while the "process of going" (gati - real going process) would be the same as cessation.

WESTERHOFF (Skt):
II.17a One does not stop after the presently traversed [space], after the [space] moved over, also not after the [space] to be traversed.

BOCKING (Ch):
2v17 lathe gone, and not-yet-gone there is no resting And in the moment–of–going there is no resting All the dharmas of moving and ceasing which exist, Are included in the idea of going.

BATCHELOR (Tb):
There is no reversal of motion*, nor also of what has gone and what has not [yet] gone. [Reversal of] going, engagement [to stay] and reversal [of staying] are similar to going.

DOCTOR (Tb):
Stopping does not occur where walking takes place, Where going has been, or where it has yet to occur. With going, beginning, and stopping, The case is the same as with going. [II.17]

GARFIELD (Tb):
17. One does not halt from moving, Nor from having moved or not having moved. Motion and coming to rest And starting to move are similar.

GARFIELD-SAMTEN (Tb):
17. One does not halt where one is going; Nor where one has gone; nor where one has not yet gone. Going and starting And halting are similar.

HAGEN (paraphrase):
There is no coming to rest because of past, present, or static motion. Movement, its initiation and its end, are all of a piece.
PINGALA COMMENTARY

2/17 If you say that one who goes is at rest, then this person should be at rest either in the moment-of-going, or in the already-gone, or in the not-yet-gone. In none of these situations is he at rest. Therefore, when you say ‘a goer is at rest’ this is not correct. It amounts to a denial both of the dharma of going and the dharma of being at rest. It is the same with moving and stopping. ‘Moving’ is like the grain of corn developing by a continuous process into sprout, stalk and leaf, and so on. ‘Stopping’ is when, because the grain of corn dies, the sprout, the stalk and the leaf die. There is continuity of characteristics so we call it movement; there is cessation so we call it stopping. It is like the process of ignorance, causing predispositions and so forth cease because of the cessation of ignorance this being called ‘stopping’. Question: Although you have refuted going and goers and resting and those at rest in various ways, nevertheless we can see with our eyes that there is going, and being at rest.

Reply: What you see with the physical eyes cannot be trusted. If there really are going and goers, are these established in terms of one dharma, or in terms of two dharmas? Two at once would be wrong. Why is this?

CANDRAKĪRTI COMMENTARY

17ab One does not come to rest either from present, past or future movement.

The mover does not cease moving on the sector already traversed because there is no motion there; nor from the sector not yet traversed as there is no motion there either; nor does he cease on the sector in traverse, because such is never experienced and because there is no activity of motion there. Hence there is no cessation of motion.

You may object that if motion (gati) is non-existent because its opposite state rest (sthiti), does not exist, still, for the sake of establishing movement we will establish rest, and that being established, movement will be established. So let rest be real because its opposite state is a fact: movement is the opposite state to rest. It exists and so rest exists as well because its opposite state is a fact.

But this too is untenable, for,

17cd Movement, commencement and cessation are the same as for motion.

Here the term movement, used to establish rest, is the same as motion; that is, it suffers from the same fallacy as motion. (fn 8 By an appeal to movement one cannot establish the commencement and cessation of rest.) This is what the verse means. As in the verse ‘The mover does not come to rest’ (MMK II.15 & 12) and the others the fallacy of adducing rest as the ground for establishing motion was pointed out, so in the same way here the fallacy of adding movement for the sake of establishing rest can be shown by rewording the two verses thus: ‘The one at rest does not move’ and so on. Movement does not exist; and as it does not exist, neither does its opposite state, rest. In this sense movement is to be rejected as was motion.

One might argue that rest is a fact because the commencement of rest is a fact. The thought is that rest commences in virtue of motion coming to an end. How could this not be so?

We reply that the commencement of rest is to be thought of in the same way as was the commencement of motion. The commencement of movement was denied earlier in the verse, ‘Motion does not commence in what has been traversed . . .’ (MMK II.12) and so on. Similarly in this case one could say, ‘Rest does not commence in what has already come to rest; rest does not commence in what is not yet at rest; rest does not commence in what is resting; where will it commence?’ By re-wording the three verses (MMK II.12-14) in this way the commencement of rest will be analogous to motion. And the cessation of rest as well is to be denied as was the cessation of motion. In the refutation of motion the fallacy was stated in this way. ‘One does not come to rest from present, past or future motion’ (MMK II.17). Similarly in the refutation of rest the fallacy will be the same as for motion. ‘One does not start moving from being at rest, from having been at rest, from not yet being at rest.’ Thus the fallacy as for motion. There is no state of rest. As it does not exist how can motion be established by those who argue for it on the ground of its opposite, rest?

Concluding denial of movement and mover

Further, if there were movement it would exist either quite apart from (vyatirekena) a mover or not so apart. Nagarjuna says that neither alternative, on being critically analysed, is possible:
The substance/attribute distinction openly endorsed by the metaphysicians cannot account for "stasis" in terms of motion, whether that motion relates to the past, present or future. According to their analysis, stasis is distinct from motion and therefore is independent. So are concepts of commencement and cessation.

17. Nāgārjuna now develops further problems with any view regarding motion as an entity; it must be either identical to or different from the mover. Both options, he will argue, turn out to be incoherent:
Kārikā II.18

INADA (Skt):  
Verse 18 - It is not justifiable to say that the coming to pass is the same as the passing entity; nor is it justifiable to say that the passing entity is different from or alien to passage.  

JONES (Skt):  
[18] To say “The motion and the mover are the same” is not correct. However, to say “The motion is other than the mover” is also not correct.  

KALUPAHANA (Skt):  
The view that movement is identical with the mover is not proper. The view that the mover is different from motion is also not proper.  

MCCAGNEY (Skt):  
The statement “the goer is the same as going” is not reasonable. The statement “the goer is different from going” is not reasonable.  

NISHIJIMA (Skt?):  
18. When the Real Act to go motion to go balanced, The real situation is just the balanced state, but such a kind of balanced state, is never attached. In another words the balanced state is just also the motion to go. And the expression, relying upon the motion to go, is not so reliable expression.  

SPRUNG (Skt):  
18 To say that movement itself is the very mover does not make sense; to say that the mover is wholly other than movement does not make sense.  

STRENG (Skt):  
[18]  

ENGLISH TRANSLATIONS  

BOCKING (Ch):  
2v18 The dharma of going is the same as the goer'; This assertion is wrong. The dharma of going is different from the goer'; This assertion, too, is wrong.  

BATCHelor (Tb):  
It is inappropriate to say: “going and a goer are the same.” It is inappropriate to say: “going and a goer are different.”  

DOCTOR (Tb):  
The act of going and the one who goes Cannot rightly be said to be the same. The act of going and the one who goes Cannot rightly be said to be different. [II.18]  

GARFIELD (Tb):  
18. That motion just is the mover itself Is not correct. Nor is it correct that They are completely different.  

GARFIELD-SAMTEN (Tb):  
18. That going just is the goer Makes no sense. Nor does it make sense that They are completely different.  

HAGEN (paraphrase):  
That movement is the mover makes no sense. That movement differs from the mover also makes no sense.
PINGALA COMMENTARY

2/18 If the dharma of going and the goer are said to be one, then this is not correct. If different, this too is incorrect. Question: What error is there in their being either identical or different?

Reply:

CANDRAKĪRTI COMMENTARY

Nagarjuna explains in what way it does not make sense:

KALUPAHANA COMMENTARY

Having distinguished substance and attribute, the metaphysicians attempt to solve the resultant philosophical issues either by assuming identity (sa eva) on the basis of an eternal substance (svabhava), thereby rendering the attribute (laksana) an ephemeral or impermanent come-and-go entity, as the Sarvastivadins did, or by emphasizing difference (anya eva), thereby denying the substance and accepting fleeting and momentary flashes of attributes without any real connections, as the Sautrantikas did. For Nagarjuna, both are inappropriate views. The two verse that follow provide specific reasons for the rejection of these two views.
Kārikā II.19

| byed pa po daṅ las ŋid kyaṅ | | gcig pa ŋid du thal bar 'gyur |

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 19 - If the coming to pass is identical with the passing entity, then (analogically) it would be the same as falling into the error of imputing a single character to the doer and his deed.

JONES (Skt):
[19] If the motion were the mover, than the oneness of the one who acts and the act itself would follow.

KALUPAHANA (Skt):
If movement were to be identical with the mover, it would follow that there is identity of agent and action.

MCCAGNEY (Skt):
If the goer would be the same as going, then it would follow that the doer and the deed become one [are identical].

NISHIJIMA (Skt?):
19. When a Real Action to go is just the same as a motion to go, The Real Fact exists really just as the same as the example, which really exists, then, The Real Thing, which is going to become into one, And so the efforts to produce something, and the real Act to produce something, might be the same actually.

SPRUNG (Skt):
19 If movement itself were the very mover it would follow that doer and deed were one thing.

STRENG (Skt):
19. And if the "act of going" (visible movement) and the "goer" are identical, The fallacy logically follows that the "person acting" (kartus) and the action (karma) are identical.

BOCKING (Ch):
2v19 If you hold that the dharma of going Is the same thing as the goer, Then a doer, and his deed Would also be one thing.

BATCHelor (Tb):
If whatever is going were a goer, it would follow that the actor and the act would be the same too.

DOCTOR (Tb):
If that which is the going Were also the one who goes, It would follow that agent and act Would be one and the same. [II.19]

GARFIELD (Tb):
19. It would follow from The identity of mover and motion That agent and action Are identical.

GARFIELD-SAMTEN (Tb):
19. If the goer were identical with going The absurd consequence would follow That agent and action Are identical.

HAGEN (paraphrase):
If movement were the mover, then the two would be one and the same.
CANDRAKĪRTI COMMENTARY

If the activity of motion itself were not quite apart from, that is wholly other (anya) than the mover, then agent and activity would be identical; and the distinction ‘this is the activity, this the agent’ would not be possible. But the activity of cutting and the cutter are not one and the same. Hence to say that movement itself is the very mover does not make sense.

How mover and movement are not wholly other (nanyatva) either, Nagarjuna expounds in this way:

KALUPAHANA COMMENTARY

Identity (ekibhava) with regard to agent and action is here presented as a necessary implication of considering the mover and motion to be the same. The non-absolutism in Nagarjuna’s way of thinking would leave the agent meaningless independent of action and vice versa.

Nagarjuna will have no difficulty in speaking of either an agent or an action in an analytical way without reaching the extremist position of recognizing distinct entities. For him, analysis (vigraha) was meaningful and practical so long as the limits of such analysis are observed.

GARFIELD COMMENTARY

19. The identity of agent and action is absurd on its face. For then whenever an agent were to perform another act, s/he would become a distinct agent. There would be no basis for identifying individuals over time.

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 20 - Again, if it is discriminatively thought that the passing entity is different from passage, then perhaps the passing entity could exist without a coming to pass and vice versa.

JONES (Skt):
[20] But if a distinction is made between the mover and the motion, then there would be motion without a mover, and a mover without motion.

KALUPAHANA (Skt):
If the discrimination is made that the mover is different from motion, then there would be movement without a mover, and mover without movement.

MCCAGNEY (Skt):
If it is assumed the goer differs from what has gone, then there would be going without a goer and there would be a goer without going.

NISHIJIMA (Skt?):
20. In another method it is just coming back to a motion to go. And in that case consideration might be changed from Action itself. In that case the Real Action to go might move to motion to go. And the motion to go might move leaving from the Real Action to go.

SPRUNG (Skt):
20 If, on the other hand, the mover is thought to be wholly other than movement, there would be movement without anything moving and something moving without movement.

STRENG (Skt):
20. Alternatively, if the "goer" is different from the "process of going" (gati - real going process), The "act of going" (gamana - visible activity and displacement) would exist without the "goer" and the "goer" would exist without the "act of going." (visible activity & displacement)
PINGALA COMMENTARY

2/20 These two are both wrong, and why? If the dharma of going were the same as the goer, then this would confuse and negate the principle of causality. The goer exists by virtue of his going. Going exists on account of the goer. Moreover 'going' means a dharma, whereas 'goer' means a person. A person abides whilst a dharma is fleeting. If these were identical, then they would have to be either both permanent or both impermanent. These are the kinds of errors we find in (the concept of) oneness. If they were different, they would contrast with each other. The goer would have to exist even when the dharma of going was not yet in existence, and the dharma of going would have to exist while the goer was not yet in existence. Since they would not be mutually dependent one dharma could cease and the other dharma be present. These are the kinds of errors that we find in the (concept of) difference.

Further,

CANDRAKĪRTI COMMENTARY

If mover and movement were wholly other, then there could be a mover unrelated to movement, and movement would be understood as unrelated to a mover which existed separately, even as a cloth is separate from a pot. But movement is not understood as existing separately from a mover. So it has been established that it does not make sense to say the mover is wholly other than the motion.

This being so,

KALUPAHANA COMMENTARY

This verse specifically lays down the limits to which Nagarjuna was prepared to go with his analytical method. That is, the analysis should not be carried out to such an extent that leaves "motion" without a "mover" or a mover without "motion." Empirical explanation does not allow for such "pure entities" completely independent of each other.

GARFIELD COMMENTARY

20. This is more complicated. It is important to recall that the target positions here are positions that reify motion as a distinct entity, however abstract. If motion were an entity, and were distinct from all movers, then it should be possible to separate motion from movers. (In 37. The principle here is the familiar Humean maxim of metaphysical analysis: Whatever is really distinct is in principle separable.) Then we should see motion when nothing is moving and movers that are not in motion. Noticing that this is a problem for Nāgārjuna’s opponent provides us with a hint as to the positive account of conventional motion that we should take from this chapter to be discussed below: Motion can only be understood in relation to movers - as a relation between their positions at different times. Movers can only be understood as movers in relation to motion so understood. But to understand motion and movers this way is not to reify them as entities - and so to escape the dilemma of their: identity or difference. Nāgārjuna emphasizes this moral in the next verse, where we must read “established” as meaning established as existent entities.

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 21 - As they (i.e., coming to pass and a passing entity) cannot possibly be established in terms of a single character nor of a different character, how could they be established at all?

JONES (Skt):
[21] When motion and mover cannot be established through oneness or difference, how can they be established at all?

KALUPAHANA (Skt):
Whose establishment is not evident either through identity or through difference, how is their establishment evident at all?

MCCAGNEY (Skt):
Of what is either identity or difference established?
Now that their establishment is not evident, how then does it occur?

NISHIJIMA (Skt?):
21. Relying upon becoming into one totally, or accomplishing the aim,
Or relying upon miscellaneous methods, or relying upon including the method above too,
But it is impossible for us to recognize the two targets together at once,
And so, how is it possible for us to hit the two targets together at once.

SPRUNG (Skt):
21 How can a pair of things exist at all if they cannot be proved to exist either as identical or as different?

BOCKING (Ch):
2v21 These two, going and goer
Whether established as identical or different dharmas,
Cannot be established in either of these two ways
So how can you say that they are established?

BATCHELOR (Tb):
If things are not established as the same and as different, how can they be established?

DOCTOR (Tb):
When two things cannot be Established as identical,
Yet not as different things either,
How can they be established at all? [II.21]

GARFIELD (Tb):
21. When neither in identity
Nor in difference
Can they be established,
How can these two be established at all?

GARFIELD-SAMTEN (Tb):
21. When neither in identity
Nor in difference
Can they exist,
How can these two exist at all?

HAGEN (paraphrase):
When neither identity nor difference can be established, how is anything established at all?
PINGALA COMMENTARY

2/21 If you have a goer and a dharma of going, you must establish them either in terms of one dharmas, or in terms of different dharmas. Both of these are untenable, and we have already stated that there is no third dharma. If you maintain that they are established (as entities) then you will have to assert that in terms of causality there is no going, and there are no goers. Now we will discuss this.

CANDRAKĪRTI COMMENTARY

According to the argument given mover and movement do not exist either as identical or as different. In what other way could their existence be established? That is why Nagarjuna says, ‘How can a pair of things exist at all.’ He means to say that mover and movement cannot be proved to exist (nasti siddhiḥ).

You may object that it is common convention to say, ‘Devadatta, the mover, moves’, as it is common convention to say, ‘the speaker speaks sentences’, or ‘the agent carries out an activity’. In the same sense the mover carries out the motion by which he realizes himself as mover. The fallacy urged does not hold.

But this too is false. For,

KALUPAHANA COMMENTARY

Here again, Nagarjuna is mining the concepts of substance and attribute. For him, these are not established either through identity or through difference. The question then is: “How is their establishment evident at all?” The rejection of the substance/attribute distinction as admitted by the Sarvastivadins and the Sautrantikas does not mean the rejection of all conceptualizations or discriminations (vikalpa). It is this particular form of conceptualization that is being questioned, not any form of conceptualization.
Inada (Skt):
Verse 22 - The passing entity which is known or described by passage does not initiate the latter because it cannot exist prior to the latter. Yet, any entity somehow does come to pass.

Jones (Skt):
[22] The mover does not make the motion by which the mover is called “the mover” since he does not exist as “a mover” prior to the motion. So who or what is it that moves?

Kalupahana (Skt):
Whatever motion in terms of which a mover is spoken of, he does not move by that motion. Because he does not exist prior to motion, who or what is it that moves?

Mccagney (Skt):
Whatever goer is said to have gone, he does not go by that going because he does not exist prior to going. So is there anyone who goes?

Nishijima (Skt?):
22. Relying upon a concrete motion to go, it is possible for us to set away the Real Action to go. The subject of going and the object of going do not go ahead actually. Therefore before the motion to go doesn’t exist really, Some kind of receptacle with subjective layers and objective layers, goes on ahead.

Sprung (Skt):
22 The mover does not carry out that motion in virtue of which he is called the mover. Because he does not exist prior to the motion. It is a someone who moves toward a something.

Streng (Skt):
22. The “goer” is defined by that which is in the “process of going” (real going process); he does not go to that destination which is determined by the “process of going” (real going process) because there is no prior "process of going." (gati - real going process) Indeed someone goes somewhere.

Bocking (Ch):
2v22 We snow a goer by virtue of his going. But he cannot employ this going. Because no dharma of going previously existed. Therefore, it is not a case of a goer going.

Batchelor (Tb):
That very going by which a goer is made evident does not [enable a goer to] go. Because there is no [goer] before going, who would be going where?

Doctor (Tb):
“The one who goes does not engage in the going That characterizes him as someone who goes, Because there is no one who goes before going. Someone goes somewhere. [II.22]

Garfield (Tb):
22. The motion by means of which a mover is manifest Cannot be the motion by means of which he moves. He does not exist before that motion, So what and where is the thing that moves?

Garfield-Samtren (Tb):
22. The going in virtue of which a goer is manifest Cannot be the going in virtue of which he goes Because he does not exist before that going. So who goes and where does he go?

Hagen (paraphrase):
The motion by which a mover is a mover is not the motion by which the mover moves. Since the mover does not exist prior to the motion, what or who is it that moves?
PINGALA COMMENTARY

2/22 Whatever may be the dharma of going by which we recognize a goer, that goer cannot employ such a dharma of going. Why is this? At the time when the dharma of going is as yet inexistent, there is no goer; neither is there a moment-of-going, an already-gone or a not-yet-gone, as if there were first a person, and a city or town which he is to reach, and there is the place from which he is to start. A dharma of going and a goer is not correct. The goer is established by virtue of the dharma of going, and the dharma of going by virtue of the goer. Moreover:

CANDRAKĪRTI COMMENTARY

22ab The mover does not carry out that motion in virtue of which he is called the mover.

Devadatta, an existing mover, does not carry out that very motion in virtue of which he realizes himself as mover. He does not attain it if you like; the idea is that he does not carry it out as agent.

22c Because he does not exist prior to the motion.

‘Prior to the motion’ means the agent prior to the motion. If the mover existed prior to the motion he would be able to effect it. Why? Because

22d It is a someone who moves toward a something.

KALUPAHANA COMMENTARY

It is possible for one to speak of a mover depending upon motion. However, when that mover is distinguished from motion, then we are left with a pure entity or person (svabhava, pudgala) to which or whom the motion is attributed and, in that case, the entity or person should precede movement. Such an entity or person is not evident in experience. Hence the statement: “He does not move by that motion.”

GARFIELD COMMENTARY

22. In this verse and in the next, Nāgārjuna is simply emphasizing the interdependence of motion and the mover. In II: 22 he notes the absurdity of the supposition that the mover and the motion are known independently. If they could be, then the mover would have to have one motion in virtue of which he was a mover and a second independent motion in virtue of which he now moves. But since prior to being in motion, no mover exists, it cannot be that the mover exists as a mover independently of the motion. This then demands an answer to the question, What moves? In II: 23 Nāgārjuna answers this in a very straightforward way: The mover who is a mover in virtue of his motion (and that motion is a motion in virtue of being carried out by a mover) is what moves. Hence, the mover is dependent for his identity as a mover on the motion; the motion is dependent for its identity on the mover. Neither has an intrinsic identity, and both are empty of inherent existence.
Kārikā II.23

गत्या ययोध्यते गन्ता ततोनय्यां स न गच्छति।
गती दले नोपपद्यते पस्मादेके प्रगच्छति॥२३॥

因去知去者 不能用異去
於一去者中 不得二去故

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 23 - The passing entity which is known or described by
passage does not initiate a different kind of passage because
in a single coming to pass there cannot possibly be two
kinds of passage.

JONES (Skt):
[23] But that mover does not make a move other than the
move by which he becomes called “a mover” since when
one mover moves, two moves do not occur.

KALUPAHANA (Skt):
Whatever motion in terms of which a mover is spoken of,
he does not carry out a motion that is completely
different from it. A two-fold motion is not appropriate,
since it is only one person that moves.

MCCAGNEY (Skt):
Whatever goer is said to have gone, he does not go by this
[being a goer] or that [having gone].
Two goings do not occur because there is only one setting
out.

NISHIJIMA (Skt?):
23. Relying upon a concrete motion to go, some expansion actually
goes, is development.
And actually speaking, anything other than that does not go really.
A concrete going does never appear being divided into two.
Therefore relying upon such a situation, it is possible for us to keep
authority relying upon only going on.

SPRUNG (Skt):
23 The mover does not carry out a motion other than
the one in virtue of which he is called a mover,
because, as there is only one mover, two motions
are unintelligible.

STRENG (Skt):
23. The "goer" does not go to that destination other than
that "process of going" (real going process)- by which
he is defined as "goer", Because when one goes
somewhere (i.e. else) two "processes of going" (real
going processes) cannot be produced.

BOCKING (Ch):
2v23 It is because of (his) going that we recognize a goer
He cannot employ a separate going
Since, within one goer
There cannot be two goings.

BATCHELOR (Tb):
[A going] which is other than the going by which a goer is
made evident does not [enable a goer to] go. Because
it is impossible for going to be twofold within a single
goer.

DOCTOR (Tb):
The one who goes does not engage in going other than
The going that characterizes him as someone who goes,
The reason being that for a single agent of going,
It does not make sense for there to be two acts. [II.23]

GARFIELD (Tb):
23. A mover does not carry out a different motion
From that by means of which he is manifest as a mover.
Moreover, in one mover
A twofold motion is unacceptable.

GARFIELD-SAMTEN (Tb):
23. The going in virtue of which a goer is manifest
Cannot be different from the going in virtue of which he
goes,
Since in one goer
A twofold going is untenable.

HAGEN (paraphrase):
The motion by which a mover is a mover does not
differ from the motion by which the mover moves.
Since only one mover moves, two motions are not
discerned.
PINGALA COMMENTARY

2/23 By whatever dharma of going we recognize a goer, the goer cannot employ any separate dharma of going. Why? Because there cannot be two dharmas of going within one goer. Again:

CANDRAKĪRTI COMMENTARY

A mover who is already in existence does not carry out a motion other than the one in virtue of which he realizes himself as mover, because it would follow that there were two motions: one, that in virtue of which he is realized as a mover, the second, that other motion which he - already a mover carries out. These would be the two entailed motions. But in the one mover there are not two motions; this would go against reason (ayuktam). On the same grounds the statements ‘the speaker speaks sentences’, ‘the agent carries out an activity’ are to be rejected.

This being so,

KALUPAHANA COMMENTARY

The distinction between the "mover" and "motion" also does not mean that the "mover" carries out a motion that is different from himself. If such a distinction is recognized, then, as explained earlier, there would be two movements, the movement as a result of which one comes to be called "mover" and the movement itself. No such dual motion is found, nor are there two movers corresponding to the twofold motion. The fact is that it is only one person that moves.
Kārikā II.24

sadbhūto gamanāṃ gantā triprakāraṃ na gacchati
nāsadbhūto ’pi gamanāṃ triprakāraṃ sa gacchati ||24||

jué dìng yǒu qù zhē bù néng yòng sān qù
bù jué dìng qù zhē yì bù yǒng sān qù

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 24 - The real state of a passing entity does not initiate three kinds of coming to pass nor does its unreal state. -
Note: The three kinds of coming to pass refer to those involved in (1) real state (sadbhuta), (2) unreal state (asadbhuta), and (3) both real and unreal state (sadasadbhuta.)

JONES (Skt):
[24] A truly existing mover does not move by thought, word, or deed, nor does a nonexistent mover.

KALUPAHANA (Skt):
(not translated)

MCCAGNEY (Skt):
A true goer going does not go in three ways.
Neither does one who does not exist as going go in three ways.

NISHIJIMA (Skt?):
24. The Real Existence, the Real Action to go, and the Real Motion to go,
Those three kinds of Real Existences are Real, but those each three does never go on separately.
The not-real existences can never be the Real Act to go,
And the three kinds of Real Existence go on as the Reality.

SPRUNG (Skt):
24 An existing mover does not carry out movement in any of the three ways; a non-existing mover (that is, one not actually moving) does not carry out movement in any of the three ways.

STRENG (Skt):
24. A real "goer" does not motivate three kinds of "acts of going:" real, non-real, and real-and-non-real; Nor does a non-real "goer" motivate three kinds of motion.

ROBINSON (Skt):
A real goer does not go the threefold going; an unreal goer does not go the threefold going; nothing real-and-unreal goes the threefold going.
24. The three ways in question are past, present, and future. Something that is inherently a mover has been shown to be incapable of motion in any of these periods. This is simply a way of emphasizing the moral of the entire chapter: Movers cannot be thought of as being movers intrinsically. Moreover, nonexistent movers - movers that are not even conventionally movers - certainly don’t move. It must therefore be that neither do movers move intrinsically nor that there is no motion. There must be a sense in which motion and movers exist, but do not do so intrinsically. The final verse must hence be read with “entity,” “nonentity,” and “existent” as asserted in the ultimate sense:
Kārikā II.25

INADA (Skt):
Verse 25 - Both the real and the unreal states (of the passing entity) do not initiate three kinds of coming to pass; therefore there are no passage, passing entity, and that which is to be transpired.

JONES (Skt):
[25] Nor does an existing-and-nonexisting mover exist. Thus, a motion, a mover, and the place of the motion are not found.

KALUPAHANA (Skt):
An existent mover does not carry out the movement in any of the three ways. Neither does a non-existent mover carry out the movement in any of the three ways. Nor does a person carry out a movement, both existent or non-existent, in any of the three ways. Therefore, neither motion nor the mover, nor the space to be moved is evident.

MCCAGNEY (Skt):
An existent or non-existent going does not go in three ways. Therefore, the going, the goer, and the gone do not occur.

NISHIJIMA (Skt?):
25. A Real Action to go, the Real World itself, and the Unreal World, Those three kinds of layers do never go ahead at all. Therefore the going to go, the persons to have worked, And the processes, which have been realized, are completely impossible for everyone to see at all.

SPRUNG (Skt):
25 A mover who both exists and does not exist does not carry out movement in any of the three ways. Therefore there is no motion, no one moving and no space traversed.

STRENG (Skt):
25. Also, a real-non-real "goer" does not motivate three kinds of motion. Therefore, the "process of going" (gati - real going process), the "goer" (ganta /self-existing subject) and "a destination to be gone to" (gantavyam) do not exist (inherently).

ROBINSON (Skt):
Therefore going, goer, and what-is-gone-to do not occur.

BOCKING (Ch):
2v25 Whether the dharma of going is fixed or not fixed The goer cannot employ the three (goings). For this reason, neither going, nor the goer, Nor the place of going exist.

BATCHELOR (Tb):
One who is and is not [a goer] also does not go in the three aspects of going. Therefore, going and a goer and also that which is gone over do not exist.

DOCTOR (Tb):
Someone who does and does not go does not engage In any of the three kinds of going either. There is, therefore, no going, No one who goes, and nothing traversed. [II.25]

GARFIELD (Tb):
25. Neither an entity nor a non-entity Moves in any of the three ways. So motion, mover and And route are non-existent.

GARFIELD-SAMTEN (Tb):
25. One that both is and is not a goer Does not go in any of the three ways. Therefore, going, goer And that which is to be gone over are non-existent.

HAGEN (paraphrase):
Neither an existent nor a non-existent movement is displayed by a mover [who is] of any of the three ways. Thus neither motion, mover, nor the space traversed are evident.
PINGALA COMMENTARY

2/25 'Definitely fixed means having real existence from the beginning and not arising on account of a dharma of going. 'Dharma of going' means the movement of the body. 'These three' means not-yet-gone, already-gone and moment-of-going. If the goer has a definite, fixed existence, then such a goer ought to exist separately from the dharma of going, though he should not be at rest. This is why it is said that a definitely fixed existent goer cannot employ the three goings. As for 'if the goer is not definitely fixed'; 'Not definitely fixed' means really nonexistent from the beginning. Since it is by virtue of the dharma of going, that we identify someone as a goer, where there is no dharma of going, he cannot employ three goings. It is by virtue of a dharma of going that a goer exists. If there is no dharma of going, then there is no goer, so how can you maintain that a goer not definitely fixed can employ the three dharmas? If we thoroughly investigate and contemplate in this way upon, the dharmas of going, the goer and the place of going, we are able to regard these goings as all mutually dependent; the goer existing by virtue of the dharma of going, and the dharma of going existing by virtue of the goer. Because of these two dharmas, there exists the situation in which going can take place. It cannot be said to be definitely existent, and it cannot be said to be definitely non-existent. In this way we may have definite knowledge that these three goings are false and insubstantial. They are empty and have no existence, being merely unreal designations, like illusions or apparitions.

CANDRAKĪRTI COMMENTARY

25ab A mover who both exists and does not exist does not carry out movement in any of the three ways.

In these verses movement means 'being in motion' (gamyate), and an existent (sadbhuta) mover is one connected with an activity of motion. A non-existent (asadbhuta) mover is one who is devoid of the activity of motion. A mover who is both existent and non-existent embraces both possibilities. It should be realized that movement too is three-fold according to its relation to the activity of motion. In this context a real mover does not carry out movement in any of its three modes - as real, unreal or both. This will be explained in the chapter ‘The Agent Subject and his Doing’. Similarly an unreal mover does not carry out movement in any of the three ways. That a mover both real and unreal does not, Nagarjuna will demonstrate in the same place. It follows, thus, that neither mover, movement nor space traversed (gantavyam), on being critically examined, exist.

25cd Therefore there is no motion, no one moving and no space traversed.

As is said in the Aksayamati Nirdesa Sutra, “Coming”, venerable Saradvatiputra, is a word meaning union; “going”, venerable Saradvatiputra, is a word meaning separation. Where there is no word for either union or separation, that is the language (padam) of the wise ones, because theirs is a language beyond ordinary words (apadayogena). The movement of the wise ones is neither coming nor going.’ (in 9 The further meanings of the verb gam must come to mind here: (a) attainment; (b) comprehension.)

If the seed itself passes over into the sprout, the sprout would be seed and not sprout which entails the fallacy of eternalism. If the sprout arises from something other than the seed that would entail the fallacy of causelessness. But nothing can arise uncaused, for example the horns of a donkey.

That is why the illustrious one said, ‘Given a seed there will be a sprout; but the seed is not one with the sprout. It is not other than nor identical with it. In the same way the nature of things is neither perishable nor imperishable.

‘The seal becomes visible in the imprint but does not in fact pass over into it. It is neither in the imprint nor divorced from it. Even so compound things are neither perishable nor eternal.’

And ‘A man catches sight of a pretty female face in a mirror or a dish of oil. The foolish man, conceiving a desire for her, starts in pursuit of his love. But as the face does not pass into and exist in the reflection, he will never attain it. As he generates his passion in error, even so, you should know, are all the elements of existence.’
The conclusion is very specifically stated in these two verses. It is not any kind of mover or movement that is rejected as being impossible. It is the really or substantially or independently existent (sad) mover or movement that is rejected. This is a criticism of (sasvata-vada). The opposite view, namely, a non-real, non-substantial and non-independent existence (asad) was the kind of impermanence advocated in annihilationism (ucchedavada) which, in the Buddhist context, is commensurate with momentary destruction (ksana-bhanga), rather than the impermanence (anitya) advocated by the Buddha on the basis of "dependent arising" (pratityasamutpada). The combination of the two metaphysical views of existence and non-existence does not lead to a happy synthesis. Change and impermanence understood in this metaphysical way do not contribute toward a reasonable and empirical explanation of the motion, the mover, or even the space moved.

25. So far so good. But then is motion completely nonexistent? Is the entire universe static according to Madhyamika philosophy? If we simply read this chapter in isolation, that conclusion might indeed seem warranted. It would be hard to distinguish emptiness from complete nonexistence. We would be left with an illusory world of change and movement, behind which would lie a static ultimate reality. But such a reading would be problematic. For one thing, it would be absurd on its face. Things move and change. For another, it would contradict the doctrine of dependent origination and change that is the very basis of any Buddhist philosophical system, which Nāgārjuna has already endorsed in the opening chapter. How, then, are we to read this discussion more positively? Answering this question is hermeneutically critical not only for an understanding of this chapter, but for a reading of the entire text, which if not read with care, can appear unrelentingly nihilistic. The positive account we are after emerges when we read this second chapter in the context of the first chapter: All phenomena, including motion, are dependently arisen and, hence, empty of inherent existence. The conclusion that motion is empty is simply the conclusion that it is conventional and dependent, like the putatively moving entities themselves. Since there is no implicit contrastive, inherently existent, ultimate reality - say of the static, or of stasis - this conclusion does not lead us to ascribe a "second, class" or merely apparent existence to motion or to movers. Their nonexistence is simply their lack of existence as substantial entities. Existence - of a sort - is hence recovered exactly in the context of an absence of inherent existence.

But existence of what kind? Herein lies the clue to the positive construction of motion that emerges. The existence that emerges is a conventional and dependent existence. Motion does not exist as an entity on this account, but rather as a relation - as the relation between the positions of a body at distinct times and, hence, as dependent upon that body and those positions. (fn 38. See also Kalupahana (1986), p. 131.) Moreover, it emerges as a conventional entity in the following critical sense: Only to the extent that we make the decision to identify, as a single entity, things that differ from each other in position over time, but are in other respects quite similar and form causal chains of a particular sort, can we say that whatever is so identified moves. And this is a matter of choice. For we could decide to say that entities that differ in any respect are thereby distinct. If we did adopt that convention for individuation, an entity here now and one there then would ipso facto be distinct entities., And so no single entity could adopt different positions (or different properties) at different times, and so motion and change would be nonexistent. It is this dependence of motion on the moved, of the status of things as moved on their motion, and of both on conventions of individuation that, on this account, constitutes their emptiness. But this simply constitutes their conventional existence and provides an analysis of the means by which they so exist. The emptiness of motion is hence seen to be its existence as conventional and as dependent, not other than its conventional existence. In understanding its emptiness in this way, we bring motion, change, and movable and changeable entities back from the brink of extinction. (fn 39. Again, the affinities to Hume are intriguing: The Humean analysis of external physical objects and of personal identity appears at first to deny the reality of either. But what emerges from a more careful reading is that Hume shows that only the reified substantialist versions of objects and selves are nonexistent. The objects and selves with which we have actual perceptual and cognitive commerce, on his view, are perfectly existent, but only in virtue of being dependent upon conventions ("custom") for their identity and existence. It is a clear analysis of their conventional character that allows us to coherently assert their existence.)

cakṣurādīndriyaparīkṣā nāma tṛtiyāṃ prakaraṇam  ||

Chapter III: Examination of the Senses
We have now completed the brief explanation of the two selflessnesses. The second major portion of the text is the extensive explanation of the two selflessnesses. It comprises five sections: the distinct explanation of the selflessness of phenomena and the selflessness of the person, the presentation of the emptiness of essence of mere phenomena, the mode of engaging with the selflessness of things as they really are, the presentation of the emptiness of essence of time, and the presentation of the emptiness of essence of the continuum of life. We now begin the first of these sections—the extensive explanation of the selflessness of phenomena and the selflessness of the person—which has two parts: the explanation of the selflessness of phenomena and the explanation of the selflessness of the person. The first of these has two sections: the explanation that the three kinds of phenomena are selfless and the refutation of the argument that they have a self. The first of these sections has three parts: the refutation of the phenomenal self of the faculties, the refutation of the phenomenal self of the aggregates, and the refutation of the phenomenal self of the elements. This chapter is the first of these three parts.
EXPLANATION:

This section has two parts: advancing the opponent’s argument and its refutation.

SUMMARY:

When the six objects are posited as that which is to be grasped, the six sense faculties are posited as the means by which they are grasped, and the six kinds of person are posited as the graspers, one should recognize that the mode of grasping of these phenomena is not as merely posited through the power of nominal convention, but that they are grasped as existing inherently. One should ascertain, as established by arguments, that there would be no grounds for positing agent, object, and instrument if they existed in the way that they are grasped. Thereafter, it will spontaneously become apparent that all of these eighteen phenomena, although they do not exist inherently, appear through the power of nominal convention, but that they are grasped as existing inherently. One should ascertain, as established by arguments, that there would be no grounds for positing agent, object, and instrument if they existed in the way that they are grasped. Thereafter, it will spontaneously become apparent that all of these eighteen phenomena, although they do not exist inherently, appear respectively as illusion-like agent, object, and instrument.

Then, it should be ascertained that all that is posited, such as the eye, seeing, etc., are completely tenable only as phenomena, although they do not exist inherently, appear respectively as illusion-like objects. This rational analysis is an investigation into whether or not such things as the eye exist inherently, but not an investigation into whether or not they merely exist. Therefore, when they are not found through the analysis, their essential existence is refuted, but such things as the eye are not refuted at all. As the commentary to Catuhsataka says, when they are not found through the analysis, their essential existence is refuted, but such things as the eye are not refuted at all. [127] As the commentary to Catuhsataka says, when they are not found through the analysis, their essential existence is refuted, but such things as the eye are not refuted at all. Therefore, their mode of existence is as presented here: The seer depends on seeing. Seeing also depends on the seer. Apart from this No cause is seen for their existence.

Through this, the rest should be understood. Although the arguments presented in the earlier chapters can refute the true existence of the faculties, this chapter has been composed so that one might understand the specific arguments refuting the essence of such things as seeing. This should be understood in the context of other chapters as well. Through such analysis, one will develop boundless wisdom, particularly with respect to the analysis of the way things really are; and it will be apparent that all experience of the six kinds of object is like that of an illusory person experiencing an illusory object.

INADA (Chapter Introductions)

CHAPTER III - Examination of the Eye-faculty, etc.

This chapter deals with the field or sphere of action of the six sense organs. However, the line of thought in the discussion necessarily entails the understanding of the logic involved in the previous chapter. There we have seen that, strictly speaking, the three concepts of gata, agata, and gamyamana cannot be maintained. In the present chapter Nagarjuna takes up only the first of the six sense organs, i.e., the seeing activity, and demonstrates its non-possibility insofar as seeing itself and others are concerned because of basic objectification or attaching an unwarranted self-nature (svabhava) to any activity.

Thus, it would follow that there is no seeing agent as such. In a similar fashion he assumes that he has demonstrated beyond doubt the non-possibility of imputing any “enduring” characteristic to the rest of the five sense organs, among which the mind is considered as the sixth sense organ.

KALUPAHANA (CHAPTER OVERVIEWS)

Part II (Dharma-nairatmya) As mentioned earlier, Chapters III and XV deal with almost all the major Abhidharma categories that are treated under general rubric “dharma.” Of these various categories, the most important are aggregates (skandha), faculties/spheres (indriya/ayatana), and elements (dhatu). This is the order in which these are normally enumerated. However, Nagarjuna was interested in epistemology, and therefore it is natural for him to take up the faculties (indriya) for examination at the very outset.

3. Faculties (indriya). Chapter III, verse 1, refers to the six faculties and their spheres. Yet, there is no denial of any one of them. This may be compared with Nagarjuna’s statement in Chapter I, verse 4, that refers to the four causal theories, all of which were instantly denied. However, in verse 2, Nagarjuna criticizes a particular definition of “seeing” (darsana) and that definition involves the “perception of itself” (svatmanam darsanam). This undoubtedly is the Indian version of the Cartesian “cogito” which led to the belief in a permanent and eternal self during the period of the Upanisads and continued to flourish in the speculations of the later Indian philosophical schools. It is the definition that produced the most metaphysical of ideas, such as the conception of the “inner
controller” (antaryamin) that turns out to be the permanent and eternal self or soul (atman). Any form of perception, for them, involved self-awareness as a necessary pre-condition, after which every other form of activity follows. In fact, later on Nagarjuna devotes an entire chapter (IX) to an examination of this notion of an antecedent self. Whether this view influenced the Yogacara conception of “serf-perceiving consciousness” (svasamvedakavijnana) remains to be seen. For Nagarjuna, however, such a definition was not satisfactory, since it implies the conception of a substantial entity.

Here again, after making a categorical denial of “seeing” as “seeing itself,” Nagarjuna proceeds to draw the implication, as he did in his criticism of other-nature (parabhava, I.3), that “if seeing cannot see itself, how can it see another?” Such a criticism on the part of Nagarjuna would still leave intact the Buddha’s own explanation of perceptual experience in terms of the principle of dependence (pratityasamutpada). In fact, it is for this reason that later on Nagarjuna was able to speak of visual perception (caksur-vijnana) as a product of causal dependence (see XXVI.4).

The criticism of “seeing” (darsana) in III.4 is similar to the criticism of causal condition in I.5. Nagarguna assumes that the implication of the substantialist notion of “seeing” is that “seeing must always see.” Thus, if the Sarvastivadins were to recognize a “self-nature” (svabhava) in “seeing”, then it could possibly not be “not seeing” even on some occasions, for the very nature of seeing is to see. Therefore, when Nagarjuna asserts that “there cannot be a non-seeing seeing” (na apasyamanam darsanam), he was merely stating the substantialist definition of the Sarvastivadins. Hence the second statement “seeing sees” (darsanam pasyati) becomes a mere tautology and, as such, is not appropriate. The rest of the chapter deals with a criticism of all forms of perception conceived in the above manner, indicating that “grasping” (upadana), etc. will remain inexplicable in such a context.

**BATCHelor (POETIC “TRANSLATION”)**

**Seeing**

If my eyes cannot see themselves,  
How can they see something else?  
Were there no trace of something seen,  
How could I see at all?

Neither seeing nor unseeing see.

Seeing reveals a seer,  
Who is neither detached  
Nor undetached from seeing.  
How could you see,  
And what would you see  
In the absence of a seer?

Just as a child is born  
From father and mother,

So consciousness springs  
From eyes and colorful shapes.

Without these eyes,  
How could I know  
Consciousness, impact,  
Feeling and thirst?

Clinging, evolving,  
Birth, aging and death?

Seers seeing sights explain  
Hearers hearing sounds,  
Smellers smelling smells,  
Tasters tasting tastes,  
Touchers touching textures,  
Thinkers thinking thoughts.
3. The Senses

In classical India, the mind is considered one of the senses, and its objects - ideas that the mind generates - thus are "sense-objects." Hence, ideas are treated the same way that material objects are, and emptiness applies equally to them.

In verse 2, Nagarjuna asserts that seeing cannot see itself and that what cannot see itself cannot see anything else. In the Seventy Verses on Emptiness 51, it is the eye that cannot see itself. The obvious objection, to use a modern example, is that scissors can cut something else even though they cannot cut themselves. The argument does not turn on whether the senses or acts of sensing are self-existent or not. Nagarjuna's only reply is to apply the analysis of motion and the mover from Chapter 2. He is not arguing that there are no senses, acts of sensing, or sense-objects, but only that none of these are self-existent - they, like "motion" and "the mover," are interdependent, and we cannot dissect any sense-awareness into three unconnected, self-existent components.

GYAMTSO (COMMENTARY)

3

An Examination of the Sources of Consciousness

In the Sutra of the Great Mother Prajnaparamita, the Buddha taught:

The eye is empty of the eye.

THERE ARE THREE VERSIONS of the Great Mother Prajnaparamita Sutras: the extensive, middle, and concise editions. The extensive, or great, sutra has one hundred thousand verses and encompasses twelve volumes. The meaning of the passage quoted here from the longest version is that the eye with which we see is empty of inherent nature. It is empty of its own essence.

Just as the eye is empty of its own essence, so the ear is empty of its own essence, and the nose, tongue, body, and mind are all the same—all six inner sources of consciousness (ayatanas) are empty of their own essence; they are all empty of what they appear to be.

In Karmapa Rangjung Dorje’s Mahamudra Aspiration Prayer, the second line of the ninth verse reads:

As for mind, there is no mind! Mind is empty of essence.

This expresses a very similar meaning: Mind has no inherent nature; it is empty of true existence.

It is the same with the six outer sources of consciousness: Form is empty of form, sound is empty of sound, smell is empty of smell, taste is empty of taste, tactile sensation is empty of tactile sensation, and phenomena that appear to the mental consciousness are empty of themselves as well. The example that helps us to understand this more clearly is when these twelve sources of consciousness appear in a dream. When the twelve sources of consciousness appear in dreams, they are dependency arisen mere appearances that are empty of themselves, empty of being anything, empty of any inherent nature. This is what we have to think about.

The Heart of Wisdom Sutra teaches that there is "no eye, no ear, no nose, no tongue, no body, no mind; no form, no sound, no smell, no taste, no tactile sensation, no phenomenon"—going through all of the twelve sources of consciousness. It does not use the exact same language as the passage from the Sutra of the Great Mother quoted here, but its meaning is the same. Therefore, the meaning of the statement "There is no eye," for example, is not that there is no appearance of the eye, but rather that the eye that appears is empty of essence.

You may be familiar with the life story of the great Tibetan siddha Machig Labdron (fn Siddha means "one who has gained accomplishment." It refers to the great Buddhist practitioners who have gained direct realization of the true nature of reality.). She was the fastest reader in the history of Tibet. In Tibet there is a tradition of reading all the volumes of the Buddha’s teachings on special occasions in monasteries, nunneries, or the homes of sponsors. A good reader can read one volume in a day; someone who is exceptionally fast can read three volumes in a day. Well, Machig Labdron could read all twelve volumes of the extensive Great Mother Prajnaparamita Sutra in a single day, which she did on one occasion for thirty days in a row. When she did this, she read, for example, that form, the first of the six outer sources of consciousness, is not white, it is not red, it is not rectangular, it is not circular—form is empty of inherent nature. As a result of reading this again and again, she realized emptiness directly and became known as the Prajnaparamita siddha, the siddha who realized emptiness by means of the Prajnaparamita Sutras. After she passed away, her son, Gyalwa Dondrup, sang a song in which he praised her for this incredibly unique feat, because while most other siddhas gain realization through Vajrayana (fn Vajrayana, or “adamantine vehicle,” is the set of Mahayana practices that is kept secret.) practices, she was able to do so from simply reading the Prajnaparamita Sutras’ descriptions of emptiness. In honor of her accomplishment, Gyalwa Dondrup praised her as “Mother, Prajnaparamita siddha-mother.” Thus we can see that it is indeed possible to realize the nature of reality by gaining an understanding of emptiness. By meditating on emptiness, if we become skilled at it, we too can become siddhas.
Nagarjuna composed this chapter in answer to those who argued that phenomena are not empty, that they truly exist, because each of the six inner sources of consciousness perceives its respective object among the six outer sources of consciousness. For example, they would say, “This flower exists because my eyes perceive it.” Thus, in order to help these people overcome this mistaken belief, Nagarjuna analyzes the sources of consciousness and demonstrates that they do not truly exist after all.

In the course of his analysis, Nagarjuna asks, “If these six inner and six outer sources of consciousness truly exist, then how do they exist in terms of their time sequence?” There are three possibilities: first, that the inner perceiving sources of consciousness exist before the objects they perceive; second, that the perceived objects exist before the subjects that perceive them; and third, that the perceiving subjects and perceived objects come into existence simultaneously.

In fact, all three of these possibilities are logically impossible. The perceiving subject cannot exist before the perceived object, because then there would be a perceiving subject without any object to perceive. Similarly, it cannot be that the perceived object exists before the perceiving subject, because a perceived object cannot exist if there is no subject perceiving it—the term perceived object necessarily implies the presence of a perceiver. Thus, the perceiving subject and the perceived object cannot exist sequentially.

They also cannot come into existence simultaneously, because two things that exist simultaneously cannot have any connection or relationship with each other. They cannot have the relationship of being cause and result, for example. This is because something that arises simultaneously with something else has no opportunity to be that second thing’s cause. It only arises at precisely the same time as its supposed result, so how could it have produced that result? It would have had no time to do so. It can therefore only be that things that arise simultaneously do so independent of each other.

In this case, it would be impossible for the perceived object and the perceiving subject to be unrelated in the way that two things that come into existence simultaneously are unrelated, because the perceived object and perceiving subject are cause and result—the cause for there being a perceiving consciousness is that there is an object to perceive. If they arose simultaneously, however, they could not have such a relationship, because the perceived object would have no opportunity to cause the perceiving consciousness to arise.

Thus, we see that in fact there is no way that the inner and outer sources of consciousness can truly occur, because they cannot occur sequentially, they cannot occur simultaneously, and there is no other possibility. So then what are they? They are mere appearances, like illusions, like e-mail, and like movies. They have no true existence.

Snap your fingers and then analyze by asking, “What comes first, the finger snap or the ear consciousness perceiving it?” We have to analyze based on our own experience, so how did they happen? Did the finger snap come first? Or did the ear consciousness perceiving the finger snap come first? Or did the finger snap and the ear consciousness perceiving it occur at the same time?

The snap you perceived could not have come before the consciousness that perceived it, or else there would have been a perceived object without any perceiver of that object. Similarly, the consciousness that perceived the finger snap could not have come first because then it would have preceded the finger snap that it perceived. Finally, the consciousness perceiving the finger snap and the finger snap could not have truly occurred simultaneously, because if they did, they would have been unrelated entities—the finger snap would not have been the cause of the arising of the consciousness that perceived it. Thus, they did not exist sequentially, they did not exist simultaneously, and there is no other possibility. Your finger snap and the consciousness that perceived it, therefore, were dependently arisen mere appearances that did not truly exist.

This is an analysis using logical reasoning that Nagarjuna first applies to the eye seeing forms, but, as we have just seen, it is also applicable to the ear hearing sounds and to all the other sense experiences as well. The verse that explains this is the eighth in the chapter:

Know that these reasonings refuting the faculty that sees
Refute the faculties that hear, smell, taste, touch, and the mental faculty as well,
Refute the hearer and the other perceiving consciousnesses,
Refute sound and the other perceived objects.

Sometimes it might seem as if the object exists before the consciousness that perceives it. For example, when we light a candle in the morning, we might come back a little while later and see the candle again, so it seems that the candle flame existed before our perception of it. That is not really the case, however, because what we are doing in that situation is mixing together all of the moments of the continuum of the candle flame and thinking that they are all the same thing. They are not just one thing, though, because each moment is completely individual, different from every other moment; each individual instant of the candle flame arises only in dependence upon its own independent set of causes and conditions, then ceases, and then is replaced by a completely different candle flame in the next instant. Thus, the individual moments of flame arising and ceasing one after the other in succession are not all the same thing, but rather they are many different things that only look alike, which is why it is so easy to mistake them for being just one thing. So the candle flame we perceive when we walk back into the room did not exist for even the slightest instant
before the moment we perceived it to be there. In the same way, whenever we talk about a perceived object, whatever it is, we are talking about something whose existence is only momentary, perceived by an equally momentary consciousness. Analyzing in this subtle way helps us to see why an object that is perceived cannot exist before the consciousness that perceives it.

We can also look at the case of a father and his son and see that the father cannot really exist before the son, the son cannot exist before the father, and they cannot come into existence simultaneously either, so they too cannot be real. If we asked people, “Who comes first, the father or the son?” everyone in the world would answer, “The father comes first.” The reason people would say that is that they mistake an entire continuum of separate instants for one thing. If it were really the case that the father existed first, then the man would have been a father before the birth of his son, and even when that man was a little boy he would also have had to be a father. That is not the case, though, because every instant in the continuum of his existence is different from all the other instants.

We have to see how it is that we confuse individual entities in a continuum for one thing, how these confused appearances exist in accordance with worldly convention, and then we have to distinguish this confused way things appear from the way things actually are, which we can determine with logical analysis.

Thus, the father cannot exist before the son, because if he did, he would be a childless father. The son cannot exist before the father, because if he did, he would be a fatherless son. They cannot exist simultaneously either, because if they came into existence at the same time, one would have no opportunity to bring the other into existence. Therefore, they do not truly exist. They are not real. Then what are they? They are mere appearances that arise due to the coming together of causes and conditions, like dreams, water-moons, and rainbows. Their true nature transcends conceptual fabrications. It is open, spacious, and relaxed.
Epistemology

An account of the theory of knowledge is important for Nāgārjuna’s investigation for at least two reasons. First of all, objects of knowledge and means of accessing them form an essential part of our conceptualization of the world and our place in it. The means of knowledge are instruments used by the self in order to apprehend objects of knowledge which connect our inner world with that of a world of outside objects. Given the centrality of these key notions of epistemology, it is obviously important to investigate whether any of these could be regarded as existing with svabhāva. Second, Nāgārjuna’s account of epistemology also has to provide the foundations of his own project. Given that the knowledge of the theory of universal emptiness is what Nāgārjuna wants to establish, it is important for him to describe the epistemology on the basis of which such knowledge is to be gained.

The Indian philosophical tradition distinguishes a variety of means of knowledge (pramāṇa) by which objects of knowledge (prameya) are epistemically accessed. Which means of knowledge are accepted and how their function is understood differs among different philosophical theories. In his discussion of epistemology Nāgārjuna lists four such means of knowledge: perception, inference, recognition of likeness, and testimony.

Nāgārjuna’s primary concern is not a discussion of the nature and interrelation of these different means of knowledge, but the question of how to establish any particular set of means of knowledge, whether it is the one just indicated or a different one. Once we have agreed that the existence of objects of knowledge is established by the means of knowledge (as for example the existence of the desk in front of me is established by my perceptual abilities, in this case primarily non-defective vision), we then have to address the further question of how to establish the means of knowledge. How do we know that these means of knowledge are good guides to the objects out there in the world?

There are three different ways in which we could try to establish the means of knowledge. First of all we could regard them as established by mutual coherence: perception is an adequate means of knowledge of the desk because its accuracy is established by other means of knowledge indicating its presence as well. Having the receipt of the delivery of the desk allows me to infer that there must be a desk in my room (since if I have such a receipt, the item in question must have been delivered), my perceptual recognition of the desk is in important ways like the perception of other medium-sized dry goods, such as tables and chairs, and finally, I can rely on the testimony of other people who also see the desk in my room. In a similar way we could then argue for the establishment of inference by the fact that the conclusions inferred are supported by perception, likeness, and testimony, and so on for all the other means of knowledge.

Second, we could assume that the means of knowledge justify themselves. We do not have to go beyond perception to realize that perception usually delivers an accurate picture of the world, but perception itself presents a faithful representation of the world and of its own validity. A popular example illustrating this point is that of the lamp which illuminates other objects at the same time as illuminating itself. We do not need another lamp in order to illuminate the lamp.

Finally, one could regard the means of knowledge and their objects as mutually establishing each other. The means of knowledge establish an object of knowledge by giving us epistemic access to it. But we could also argue that the object in turn establishes the means of knowledge. Given that we manage to interact with the objects of knowledge more or less successfully (as confirmed

by the evolutionary success of our species), there must be something among our cognitive means that gives us a relatively accurate account of the way things are. In this way epistemic success allows us to establish the means of knowledge via the objects successfully cognized.

Nāgārjuna does not devote a great deal of discussion to the first alternative, the establishment of the means of knowledge by mutual coherence. This seems sensible, for even if the argument succeeds, the kind of establishment of the means of knowledge that can be derived from it is not exactly what Nāgārjuna’s Naiyāyika opponent is looking for. He is trying to argue that the means of knowledge provide us with information about the nature of independently existing reals. But it is clear that the mutual establishment of means of knowledge can do no such thing. All it can do is establish the coherence of statements arrived at by different means of knowledge. But the mere coherence of some set of statements is not sufficient for showing that there is anything with an independent existential status that they describe. There are, after all, coherent fairy-tales.

Let us therefore now consider the remaining two possible ways of establishing the means of knowledge.

8.1. Means of Knowledge as Self-established

Regarding the means of knowledge as self-established has the immediate advantage of avoiding two difficulties. First, we get around the infinite regress of establishing the means of knowledge by other means of knowledge, which then in turn need yet other means of knowledge to establish them, and so forth. Unlike other forms of infinite regress that Nāgārjuna accepts (such as an infinitely extended chain of causes and conditions), this regress is vicious, since the burden of proof is transferred in its entirety to the preceding stage, since preceding means of knowledge would have to establish all the succeeding ones.

Second, the self-establishment of the means of knowledge allows the opponent to hold on to the assumption that everything knowable is established by the means of knowledge. It might be attractive to give up this assumption in order to escape the vicious regress, but doing so then makes it necessary to give a special reason (vīṣeṣaḥahetu) explaining why ordinary objects are established by means of knowledge, but the means of knowledge themselves are not.

8.1.1. Means of Knowledge Compared to Fire

In support of the self-establishment of the means of knowledge, we are presented with the following example:

Fire illuminates itself as well as other objects. In the same way, the means of knowledge establish themselves as well as other objects.

This argument is based on a recognition of likeness (upamāṇa). Because the means of knowledge are like the fire, to the extent to which fire illuminates objects in the dark and thus brings them to our attention, in the same way the means of knowledge retrieve objects from the darkness of ignorance. Now it would be absurd to suggest that there is a vicious regress involved in the illumination of the fire, with someone arguing as follows: “Because we can see the object, it must be illuminated by something. It is illuminated by the fire. But we can see the fire too. So something must illuminate it. So there must be a second fire, which is either invisible or visible. But how can it be invisible, since it illuminates a visible object (namely the fire)? So it must be visible. But then we need a third fire to illuminate the second fire, and so forth.” It is clear that the error occurs through the assumption that there must be a different fire illuminating the fire: a fire can illuminate both itself and other things. Therefore, given the similarity of fire and means of knowledge, and thereby of arguments presented in NS 2, 1, 8–20, confuses the pragmatic question of how our epistemic enterprise should proceed with the philosophical question of its justification. See also Siderits (1980: 331); Siderits (2003: 141).

14. Some references supporting the close connection between illumination and cognition in Indian thought are given by Burton (1999: 163–164). He also offers a different reading of this argument, claiming that as an illuminated object manifests the existence of light, the existence of a known object manifests the existence of a means of knowledge (161). This, however, appears to conflate this argument with the establishment of means of knowledge by their objects, discussed separately below. This reading is also not very satisfactory from a hermeneutical perspective, given that it lets all of Nāgārjuna’s arguments dealing with self-illumination come out as very problematic (as Burton sets out to argue on pages 165–172).
the relations of illumination and establishment, the means of knowledge can establish both themselves and other things.\textsuperscript{15}

Nāgārjuna tries to counter the use of the example of fire to demonstrate the means of knowledge as self-established by arguing for two claims:

- Fire does not illuminate other objects.
- Fire does not illuminate itself.

Note that the establishment of either of these theses is sufficient for refuting the opponent, because each one would demonstrate that an argument by the recognition of likeness between the means of knowledge and fire cannot be used. Nāgārjuna sets out to establish both claims.

In order to argue for the first claim, he observes that in order to illuminate an object, a fire has to illuminate the darkness concealing that object. In order to do so, fire and darkness must come into causal contact, so that one can remove the other. Such a situation, however, is impossible:

A lamp cannot illuminate when it is connected with darkness since their connection does not exist. Why are the lamp and darkness not connected? Because they are opposed. Where the lamp is, darkness is not. How can the lamp remove or illuminate darkness?\textsuperscript{16}

The point Nāgārjuna wants to make here is that darkness and light cannot be understood as two independently existent objects one of which acts on the other when they come into contact\textsuperscript{17}. The illumination of darkness by light is not analogous to the dissolution of salt by water, because darkness is the mere

15. We might want to note the similarity of this argument to the “glue” objection to Bradley’s regress. This regress occurs once we think that what unifies two constituents of a state of affairs (such as an individual and a property) is the instantiation relation holding between them, and that this instantiation relation has a distinct ontological status; because then we need a further relation to connect the instantiation relation with the individual and the property and so forth. To see what goes wrong here, we can argue that when glueing two things together we do not require superglue to first glue the glue to the objects and then super-super-glue to glue the super-glue to the glue and so forth. It is the glue itself that can connect to the objects, as well as connecting the objects themselves.

16. \textit{re zhi} \textit{mar me ni mun pa dang phrad nas gsal bar byed par mi ’gyur te phrad pa med pa’i phyir ro} | gang gi phyir mar me dang mun pa ni phrad pa yod pa ma yin te | \textit{’gal ba’i phyir ro} | gang na mar me yod pa de na mun pa med na ji ltar mar me ’di mun pa sel bar byed pa’am gsal bar byed par ’gyur. \textit{VP(S) 24:2–8. See also VV 38, MMK 7:10.}

17. Another example where Nāgārjuna rejects this assumption (even though we are here dealing with mutually dependent rather than with mutually exclusive entities) is the case of fire and fuel. Nāgārjuna argues that we cannot conceive of these as two distinct entities which produce an effect (heat and illumination) when put together, in the same way in which the union of man and woman produces an effect, i.e., a child (MMK 10: 1, 21. See also Garfield (1995: 191–192)). This is so because fire is existentially dependent on fuel, while fuel is at least notionally dependent on fire.

\textit{absence} of light\textsuperscript{18}; it is wherever light is not. For this reason the two can never come into spatial contact.

Nāgārjuna’s opponent argues in VV 38 that light and darkness might coexist during the process of origination (\textit{utpadyamāna}) of light. So light and darkness would both be present at the same time for a single moment, and then the light would start to act on the darkness in order to remove it. But this theory leaves us with the problem of explaining what causes light to remove the darkness in its second moment of existence but not in the first. If light does not have the causal power to remove darkness in the moment of its origination, how could it have this power later on?\textsuperscript{19}

On the other hand it would be highly unsatisfactory to regard light and darkness as independently existing objects which interact without coming into contact. For if light could act on darkness at a distance without spatial contiguity (as the planets were seen to act on human beings in ancient India,\textsuperscript{20} and as we now know such forces as gravity and magnetism to work) without influencing it causally, it is difficult to explain why for example a certain lamp can dispel only a certain darkness (namely the one in this room) but not other ones (such as the darkness in the room next door).\textsuperscript{21}

The refutation of the second claim (that fire illuminates itself) proceeds by analysis of the notion of illumination. For something to be illuminated, it must first exist hidden in darkness and subsequently made visible by light shining on it.\textsuperscript{22} But it is obvious that this is not true of the fire: it does not first exist hidden away in darkness, like a pot in a dark room, and is then made visible by shining its own light onto itself.\textsuperscript{23} If we conceive of illumination as the prevention of darkness (\textit{tamasah. pratigātah.}),\textsuperscript{24} we would have to assume that darkness is somewhere in the fire or encapsulating it to hide it from view.\textsuperscript{25} But this would mean that we are again thinking of darkness as an independently existing substance preventing illumination, something like a thick lampshade which prevents the light from reaching our eyes. But as Nāgārjuna has argued above, this view of darkness as a substance is thoroughly unsatisfactory, since darkness is nothing but the absence of light.

24. VV(S) 66:10.

25. VP 10. See also BCA 9:18.
Nāgārjuna also adds a second argument against the self-illumination of fire. He first claims that since the illumination by fire proceeds by the consumption of fuel, self-illumination would entail self-consumption, that is, fire would burn itself as well as its fuel. Of course we cannot argue that if one quality of an object acts on itself, any other of its qualities will do so as well. An oven may heat a piece of wax as well as itself, and melt the wax, but not melt itself. Nāgārjuna must therefore regard the fire’s burning of fuel and its illumination of objects as the very same process. But we do not have to say that the fire burns down because there is less fuel (it being gradually consumed by the fire) and less fire (because it gradually consumes itself). Fire is just the burning of the fuel rather than some distinct entity acting both on the fuel and also on itself. Therefore, if there is no self-consumption of fire, there should also be no self-illumination.

Second, if fire illuminated itself, and perception was to be understood as structurally similar to illumination, the different modes of perception should also be able to perceive themselves: seeing should be able to see itself, hearing hear itself, and so on. Vision would be possible in the absence of any distinct object, because vision could act as its own object of sight. Visual perception would then be regarded not as an intrinsically relational phenomenon, but as something based solely on some essentially perceptive quality of vision. Since such a non-relational understanding of visual perception (and of any other kind of perception as well) is unsatisfactory, Nāgārjuna argues that if the parallel between perception and illumination is maintained, fire cannot be seen as self-illuminating.

Third, since darkness is the opposite of light, if light illuminates itself, darkness should conceal itself. But then we should not be able to perceive

26. VV 35.
27. As pointed out by Burton (1999: 167).
29. It is interesting to note that the Madhyamaka argument against the Yogācāra view of the mind as self-illuminating (sva-prakāśa) given by Śāntideva in the BCA is another reason by recognition of likeness (upamāṇa): that of a sword that cannot cut itself (9:17). The Yogācāra view is also criticized by Śāntarakṣita in the Upaniṣadānārāyaṇa 3:2, and in his commentary on the Br. hadāran. yāka Upaniṣada 4:3:7. For further references to this “anti-reflexivity principle,” see Siderits (2003: 32, na). It is important to note, however, that even though the example of the lamp or fire is used in the discussion of both, the question of whether the mind is self-illuminating and the question whether the means of knowledge are self-established are distinct. See Siderits (1980: 334–335, n. 4), Burton (1999: 155–156).

35. MMK 3:3.

Apart from attempting to find fault with the opponent’s example based on the supposed self-illumination of fire, Nāgārjuna also presents us with positive arguments against the self-establishment of the means of knowledge. First of all, if a means of knowledge, such as visual perception, were self-established, it should be able to exist independently of the existence of an object of vision. But if we then assume that it is an essential property of visual perception to see, visual perception must be able to function as its own object, because otherwise there might be no other object to be seen. This reasoning, Nāgārjuna claims, then leads to the same problem encountered in the analysis of motion. Because the mover and the place being moved over cannot exist simultaneously, since motion takes time, vision cannot see something that exists simultaneously with it (such as itself), since vision takes time too.

Second, observing again that if the means of knowledge are self-established, then they will be established independently of the objects known, Nāgārjuna argues as follows. Assume that we wanted to chose those among all the different means of cognitive access to the world that deliver accurate knowledge of the nature of the objects known, that is, that qualify as means of knowledge. We would select all those that have a specific internal quality (such as the cognitive equivalent to self-illumination). The possession of this quality would then guarantee that its possessor delivered accurate information about the nature of the objects cognized. But how is the connection between the specific internal quality and the correct representation of the object justified? After all there are all sorts of properties our means of cognitive access to the world can have, so how do we know that a specific one is a guide to accurate representation?

Suppose we are presented with a set of fancy mechanical devices and are asked to select the five best can openers from these. No detailed study of the
internal properties of each will allow us to accomplish that task. We have to analyze each in relation to a can and try to determine the way in which it might open it. Only then would we be able to conclude which particular properties of the mechanisms are correlated with good can-opening abilities. In the same way, we can regard an internal quality of a way of accessing the world only as a characteristic of a means of knowledge once we have assessed it in relation to the objects cognized. Only then can we conclude that this particular property really leads us to the knowledge of the nature of the object, rather than doing something else. But in this case the establishment of the means of knowledge can no longer be regarded as self-establishment, since it incorporates reference to other objects (namely the objects known) at an essential place.

8.2. Means of Knowledge and Their Objects as Mutually Established

If the argument for the self-establishment of the means of knowledge is not successful, the remaining option is to argue that the means of knowledge and the objects of knowledge mutually establish one another. Assume that I see an apple on the table. The existence of the apple, the object of knowledge, is established by the means of knowledge that is perception. But we could equally argue the other way around: that the object known establishes the means of knowledge. This argument would invite the immediate objection that we then need prior cognitive access to the object known, and if we have this we must already have established the means of knowledge. We are therefore pointlessly establishing it twice. But if somehow gain access without relying on the means of knowledge, the whole project of establishing these means seems futile, since it is precisely the justification of our means of gaining knowledge of the world which we have set out to scrutinize.

We will therefore need a different argumentative strategy to argue for the mutual establishment of objects known and means of knowledge, and in particular for the establishment of the latter by the former. One way of going about this (which does not commit us to the viciously circular mutual establishment criticized by Nāgārjuna) is to argue that the object of knowledge is perceived, there must be something bringing about such a perception, and this is the means of knowledge. In this case the apple establishes the existence of the means of knowledge by which it is known. An essential prerequisite for this latter direction of establishment is of course success. Because we successfully apprehend an apple, our means of apprehension is regarded as a means of knowledge. If we were susceptible to frequent apple-hallucinations which disappeared once we tried to touch them, we would not regard perception as a reliable apple-detector, that is, as a means of knowledge. But since we are generally successful in our cognitive interactions with the world and normally only perceive the existence of apples which are indeed there, the very fact that we successfully apprehend a world of outside objects serves as an argument for regarding the successful means of apprehension as means of knowledge.

An immediate difficulty with this procedure is that we also need a means of knowledge for establishing the success of our cognitive actions, that is, we need to ascertain whether we really are perceiving the apple or just an apple-hallucination. Nothing seems to rule out that there are some means of knowledge that first deceive us about what we see and later deceive us about the outcome of whatever procedure we use to establish whether the first cognition was successful. But this possibility need not rule out any attempts of mutually establishing the means and the objects of knowledge if we do not use epistemically suspect procedures (which we know to have led to unsuccessful cognitions in the past) to establish the success of our cognitive actions.

A more worrying question is whether the mutual establishment of means and objects of knowledge—if successful—actually delivers the account of means of knowledge that Nāgārjuna’s opponent wants to defend. In order to see whether it does, we have to note first that the notion of “successful cognitive apprehension” referred to above cannot just be an act of cognition which leads to a successful action, since many of our cognitions (and many of the beliefs subsequently acquired) are never acted upon. We therefore also have to include coherence with other cognitions or beliefs as a criterion for the success of some means of knowledge as well. Our cognition of the apple on the table might therefore be deemed successful either if it leads to a successful action.

43. This way of establishing the means of knowledge is what Nāgārjuna criticizes in VV 51 by saying prasiddhah [..] bhavati na ca prameyaih [..] pramānān ānāṃ.
means of knowledge and their objects, Nāgārjuna argues, father and son would not be distinguished by any substantial difference.51

This is a familiar argumentative move we encounter repeatedly in Nāgārjuna’s works. A different and more unusual response to the proposal of mutual establishment is given in the VP. Nāgārjuna observes:52

Potness is perceptible, but the pot is not. That which is the object of the sense-faculty (dbang po la rab tu phyogs pa’i don), that is perceived. If we apply the term (brda) “visual sense-faculty” then the object [of that faculty] is perceptible and depends on conditions like light and so forth. Thus pot and so forth are established as perceptible.

The idea behind this argument is to deny the establishment of the means of knowledge by the object known by denying that the object of knowledge (the prameya) is an external, independently existent real. The Naiyāyika opponent wants to argue that since our cognitions are generally successful, and since this success serves as an indication of the existence of an external, mind-independent reality, the means of knowledge are just those things that allow us access to this reality. Nāgārjuna replies that in fact the object perceived by our sense-faculties is not the external object, but a mental representation of the object. Nāgārjuna here embraces a representative theory of perception which does not assert (as a naïve realist would) that we have direct and unmediated cognitive access to the objects of the external world.53 What is directly perceived is the sense-datum (what Nāgārjuna calls the object of the sense-faculty [dbang po la rab tu phyogs pa’i don]), on the basis of which information about the external object is inferred. If, for example, we look at a white disc under red light at an angle, our sense-datum will be a red ellipse, though, knowing some basic facts about vision and about the peculiar lighting conditions, we perceive a white disc. Nāgārjuna stresses the contribution of inference to knowledge gained by

52. bum pa nyid mngon sum yin gyi bum pa ni ma yin te dbang po la rab tu phyogs pa’i don gang yin pa de ni mngon sum yin par byas nas mig gi dbang po la dbang po’i brda byas la de la rab tu phyogs pa’i don gang yin pa de ni mngon sum yin zhing de yang snang ba la sogs pa’i rkyen la lhos pa ste de phyir bum pa la sogs pa nyid mngon sum du yongs su grub pa yin. VP(S) 29:6–13.

53. Burton (1999: 192) “suspects that Nāgārjuna actually means that [. . .] the knowledge-episode itself is constitutive of the object known.” This is indeed the case. Burton is also correct in claiming that there is not much of an argument for this position in Nāgārjuna’s texts. But given the generally elliptic nature of the VP, this philological gap does not necessarily entail the existence of a gap in Nāgārjuna’s philosophical argumentation as well. Tola and Dragonetti (1995b: 12) suggest that the Yogācāra flavor of VP 18 could be interpreted as evidence for locating the composition of the VP after the appearance of the Yogācāra school, about 350 a.d., which would speak against its attribution to Nāgārjuna. Given the somewhat isolated nature of VP 18 in Nāgārjuna’s argument, this suggestion does not seem to me to be able to bear much weight.

(we reach out, grasp the apple, and eat it) or if it coheres with other means of knowledge (for example, with my memory of buying a bag of apples and putting them on the table). However, the difficulty with employing coherence in this way is that we have to select a certain set of cognitions or beliefs which we hold fixed, so that we can then evaluate the status of other cognitions relative to them. One problem now is of course how to ensure the accuracy of this selected set: if they are not accurate themselves, coherence with them has very little weight. But let us assume for the sake of argument that they are indeed accurate and constitute an epistemological fixed point relative to which other means of knowledge could be justified.

The remaining worry is that Nāgārjuna’s Naiyāyika opponent wants to establish the means of knowledge as something which gives us cognitive access to a world of independently existing reals. But as long as we do not know the initial set to be accurate (even though it may be), it is hard to see why coherence with the selected set should provide us with such access. Since we cannot establish the accuracy of the initial set without circularly assuming that we have already established some means of knowledge, the possibility remains that a different selected set would have provided us with a different set of means of knowledge coherent with it. As Mark Siderits observes: “Since at no point in our proof is there appeal to any facts other than those concerning logical relations among cognitions, we cannot legitimately include in the resultant theory of the pramāṇas the claim that they yield direct knowledge of their objects.”50 There is no explanation why coherence with the selected set should assure us that the means of knowledge indeed “reach out” to provide us with knowledge of an independently existent world of objects as long as we do not have an independent way of establishing the accuracy of the selected set.51 But if such could be done, the entire attempt of mutually establishing means and objects of cognition would be superfluous.

The argument against the mutual establishment of means and objects of knowledge just presented is very much a rational extrapolation: it is what Nāgārjuna (as well as a Mādhyamika more generally) should say in response, even though we do not find such a detailed argument in Nāgārjuna’s texts. The argument in the VP fundamentally boils down to the observation that the mutual establishment of the means and objects of knowledge excludes the possibility of either existing by substance-svabhāva, that is, independently of any other object. If father and son were mutually established in the same way as

49. 1980: 318.

perception. He notes that in the same way in which the inferential process is based on some perception in order for us to arrive at some piece of nonperceptual knowledge, such as when we infer fire from smoke, there is an inferential process at work in ordinary perception as well, which, on the basis of the object of direct acquaintance (the sense-datum) subsequently produces the object of perception. But it is evident that for the proponent of a representative theory of perception, an object of knowledge cannot serve as establishing a means of knowledge in the way the Naiyāyika requires. Since all we are directly acquainted with is the sense-datum, we cannot use this acquaintance to support the view that there are epistemic processes which give us direct access to a world of external, independently existent reals.

8.3. Temporal Relations between Means and Objects of Knowledge

Apart from the question of how the means of knowledge are established, Nāgārjuna also investigates the question of how they are related to the objects of knowledge. The two stand in a causal relation. In the case of perception, for example, the contact between the sensory faculty and the object perceived brings about the object of knowledge which for Nāgārjuna is not an external object but a sense-datum. It is therefore hardly surprising that Nāgārjuna sees the relation between means of knowledge and objects of knowledge as facing the same difficulties as those of other causes and effects. He concentrates specifically on the problematic nature of their temporal relation.

If the means of knowledge exists before its object, there is no justification for calling it a means of knowledge, since Nāgārjuna argued earlier that being such a means cannot be a purely intrinsic feature of some cognitive way of accessing the world. A different interpretation of this difficulty is found in

54. See Matilal (1986: chapter 8).
55. “In the same way [in the case of inferential knowledge] based on the connection between fire and smoke there is an inference preceded by a perception.” de Zeeuw du me dang du ba la ’brel pa las mngon sum sngon du ’gro ba can rjes su dpag pa yin no. VP(S) 29:14–16.
56. The role of inference (or, as contemporary cognitive science would prefer to put it: the implicit reliance on biologically hard-wired rules in interpreting perceptual input) in the formation of visual perception in particular is now well supported by empirical research. See Hoffman (1998) for an accessible summary.
57. See VV(S) 70:17–18 where the means of knowledge is described as the cause (kāraṇa) of the object of knowledge.
60. Vātasya’s Bhāṣya on the NS 2.1.9. Here the means of knowledge is regarded not as the perceptual faculty, but as a specific act of perception, and the object of knowledge as the object in the world which, when in contact with the sense-organ, produces the perception. The prior existence of the means of knowledge would then be equivalent to the existence of the effect before the cause.
61. If it existed after the knowable object, there is no justification for calling the object of knowledge an object of knowledge, since there is not anything yet by which it is known. Nāgārjuna also identifies another difficulty when he argues that an arisen and a non-arisen thing cannot abide together. If two things are such that one exists only now and the other only at a later moment, it cannot be the case that the second has any effect on the first, such as making it known.
62. The final possibility is that the means of knowledge and its object exist simultaneously. The difficulty is here that for two simultaneously existing things (such as the two horns of a cow, which Nāgārjuna gives as an example, but also, e.g., the two ends of a see-saw moving in opposite directions), it becomes problematic to establish which is the cause and which is the effect. For Nāgārjuna the means of knowledge brings about the object of knowledge, the sense-datum. Therefore the means of knowledge is a cause, the object of knowledge its effect. But in this case we would better not assume that they exist.

63. For the Naiyāyika this dependence is purely notional (Jha [1984: 609, n. 4]), whereas for Nāgārjuna it is both notional and existential, as argued in our discussion of causation on page 98 of this book.
64. ma skyes pa dang skyes pa dag bhan cig mi gnas pa. VP(S) 28:24–25.
65. In his commentary on NS 2, 1, 11 (NS 421–424) Vātasya argues that the problem is that if means and object of knowledge existed at the same time, there could be no sequence of cognitions. The point seems to be that if, for example, we hold a pot in our hand and thereby have both a visual and a tactile perception of it, the optical and haptic properties of the pot exist at the same time—and so should the corresponding perceptions. In our consciousness, however, they occur as successive, and indeed this non-simultaneity occupies an important place in the Nyāya theory of mind (see NS 1, 1, 16).
simultaneously, since it is the temporal ordering which characterizes one item as a cause, the other as an effect.66

One potential way of dealing with the difficulty of the temporal relation between means and object of knowledge is outlined by Vāt.syāyana in his commentary on NS 2, 1, 11.67 He claims that the term pramāṇa is to be applied to something that has been the cause of apprehension of an object in the past, is so at present, or will be in the future. Similarly, the term prameya is to be used for an object that was apprehended in the past, is presently being apprehended, or will be apprehended in the future. Only in this way can we make sense of somebody saying “Bring the cook to do the cooking,” since he has not cooked yet—otherwise the term “cook” would fail to refer. In this case we use “cook” just as a synonym for “whoever will do the cooking.” The problem with this reply is that in this case it is obvious that being a cook is not regarded as an essential property of the person referred to. Since statements about the future are contingent, the expression “whoever will do the cooking” must be able to refer even if it turns out that person designated does not cook in the end. But now it is evident that someone who takes “cause” and “effect” to denote essential properties of things—as Nāgārjuna’s Naiyāyika opponent does—cannot help himself to this reply. Because a statement referring to a cause or a means of knowledge might really be talking about what this thing is likely to do in the future, it must be possible that the thing picked out does not cause anything, or does not give us access to an object of knowledge—otherwise its intelligibility now would depend on what happens in the future. Since this is not the case (we know what “what is going to be a means of knowledge in the future” etc. refers to, and we do not know what is going to happen in the future), being a cause or a means of knowledge cannot be an essential property of the thing, since it could lose this property while remaining that very thing.

8.4. The Aim of Nāgārjuna’s Arguments

Nāgārjuna’s aim in his discussion of epistemology is not to argue that means of knowledge and their objects do not exist at all.68 Such an argument immediately generates a paradox, for the non-existence of the means and objects of knowledge is itself an object of knowledge arrived at by some means. But then there must be at least one means and object of knowledge, something that was previously denied.69

What Nāgārjuna sets out to do is refute the existence of either means or objects of knowledge with substance-svabhāva.70 He thus wants to show that there are no procedures that are intrinsically and essentially means of knowledge, nor are there independently existent reals of which they give us knowledge. Means of knowledge and their objects are notionally interdependent: without its ability to give us epistemic access to some thing, we would not label a cognitive procedure a means of knowledge. Similarly something cannot be called an object of knowledge unless there exist a means which allows us to know it. We can also argue that the two are existentially dependent on one another. The existence of certain objects of knowledge allows us to divide off certain types of our cognitive procedures and label them as means of knowledge; it is not the case that this division proceeds along certain fissures which had been there all along. Since our consciousness is a continuous flow without ready-made fissures, the objects of knowledge can be regarded as bringing the means of knowledge into existence. Similarly if the object of knowledge is to be identified with a mental representation (as Nāgārjuna argued above), it is evident that the means of knowledge brings this object about by unifying information received through the different sensory modalities. Means of knowledge and their objects therefore cannot be regarded as distinct substances.

This point is also stressed by Nāgārjuna’s argument that each can assume another’s role: a means of knowledge can be an object of knowledge and vice versa. There are two different ways to argue for this position.

First of all,71 building on the familiar Nyāya definition that a means of knowledge is what produces the knowledge of something,72 we can argue that since the object of knowledge is what brings the means of knowledge about, it is an essential part of what produces the knowledge of something, and therefore is an essential part of a means of knowledge. A similar argument can be applied to means of knowledge.73

Alternatively we could argue that a means of knowledge at one time can be an object of knowledge at another time, and vice versa. For example, when we establish a certain cognition as correct, this means of knowledge is an object of knowledge is itself an object of knowledge arrived at by some means. But then there must be at least one means and object of knowledge, something that was previously denied.69

66. I disagree with Burton’s claim (1999: 193) that Nāgārjuna “provides no justification […] for his unusual and far from self-evident assertion,” since this matter is extensively discussed in those passages where Nāgārjuna deals specifically with causation (rather than with causal issues in epistemology). See chapter 5, section 5.4.3.
67. NS 421–424.
68. As claimed by Burton (1999: 194, 198).
70. VP 2.
71. See Vātsyāyana’s Bhāṣya on NS 2, 1, 11 (NS 421–424).
knowledge. And what is thus known to be correct and is an object of knowledge can in turn be a means of knowledge for knowing other objects of knowledge later on. Vātsyāyana illustrates this point with the example of a piece of gold which can be both the object tested (if we want to determine how heavy it is) or a testing object itself (if we want to check the accuracy of a pair of scales). In fact, as Nāgārjuna points out, the Naiyāyikas themselves count ideas (buddhi, blo) both as a means of knowledge and as an object of knowledge. Either way it becomes evident that means of knowledge and their objects cannot exist as essentially different entities.

It is important to realize that Nāgārjuna’s rejection of the essentially existing means and objects of knowledge is presented within the discussion of the knowability of emptiness. His opponent argues that if all things are empty, means and objects of knowledge are empty too. But if ultimately there are no objects of knowledge, emptiness cannot be an object of knowledge. And if there are ultimately no means of knowledge, if nothing has the intrinsic nature that is characteristic of a means of knowledge, then emptiness, even if it obtained, could never be known. There appears thus to be a fundamental inconsistency in the Madhyamaka project of establishing the truth of emptiness.

Nāgārjuna’s response to this difficulty is to investigate the realist’s way of accounting for means and objects of knowledge with characteristic natures as means and objects, in order to demonstrate that all possible ways of establishing them fail. This sequence of arguments, which has already been discussed above, is to be seen not so much as a tu quoque move on the side of Nāgārjuna but as an assessment of the realist’s epistemological position which lets emptiness come out as unknowable. For the realist, means and objects of knowledge have intrinsic characteristics, and there are invariant relations of epistemic priority, that is, cognitive procedures which are means of knowledge in all possible contexts. On this account of epistemology it is indeed impossible to establish emptiness. But as we saw earlier in this chapter, Nāgārjuna tries to argue that this is not the right account of epistemology. Even though there are no means of knowledge that are intrinsically such, that deliver knowledge in every context, there are still cognitive procedures which function as means of knowledge in the specific context in which they are employed, regimented by certain background constraints and other pragmatic features. By using these procedures (which, Nāgārjuna argues, are all the means of knowledge there are anyway) we can achieve knowledge of emptiness even though ultimately there are neither means of knowledge nor objects of knowledge. Certain procedures can still count conventionally as means of knowledge within the framework of certain aims and directions of inquiry.

Nāgārjuna’s arguments about epistemology have therefore to be seen as fulfilling two purposes. First, they continue his general project of examining different types of objects one by one and arguing that none has substance-svabhāva by considering means of knowledge and their objects. Second, and more specifically, they establish the necessary background epistemology needed for understanding how emptiness could in fact be known. It is this second aim which is particularly interesting, since it provides us with the outlines of a specific Madhyamaka theory of knowledge.

Language

In contrast to such topics as causation, motion, the self, and the theory of knowledge, language is not given much explicit discussion in Nāgārjuna’s works. This does not mean that such matters were not important to Nāgārjuna but merely that his extant writings do not contain an extended connected discussion of the impact of his theory of emptiness on our view of language. Nevertheless it is possible to extract some of Nāgārjuna’s views on this philosophically highly interesting issue from remarks found at different places in his works.

9.1. Nāgārjuna’s View of Language and the “No-Thesis” View

A good starting point for the discussion of Nāgārjuna’s conception of how the theory of emptiness affects our view of language is his so-called no-thesis view. This is without a doubt one of the most immediately puzzling philosophical features of Nāgārjuna’s thought and is also largely responsible for ascribing to him either sceptical or mystical leanings (or indeed both). The *locus classicus* for this view is found in verse 29 of the VV:

If I had some thesis the defect [just mentioned] would as a consequence attach to me. But I have no thesis, so this defect is not applicable to me. ́

1. yadi kācana pratijñā syān me tata eṣa me bhaved doṣah. / nāsti ca mama pratijñā tasmān naivāsti me doṣah.

That this absence of a thesis is to be regarded as a positive feature is stressed in YS. 50, where Nāgārjuna remarks about the Buddhas:

For these great beings there is no position, no dispute. How could there be another’s [opposing] position for those who have no position?²

Now it is important to observe that when these passages are considered in isolation, it is very hard to make any coherent sense of them, for even if we assume that the Buddhas do not hold any philosophical position anymore (having perhaps passed beyond all conceptual thinking), how are we to make sense of the first quotation which, in the middle of a work full of philosophical theses, claims that there is no such thesis asserted at all?

In fact this first statement is even more difficult to interpret than the famous last sentence of Wittgenstein’s *Tractatus*, which is preceded by the equally famous ladder-metaphor.³ Although Wittgenstein here denies that his preceding statements are of anything but instrumental value, claims that they turn out to be nonsensical *after* they have fulfilled their instrumental role, and that there is something outside of the grasp of these statements, at least he does not deny making any statements at all!

9.2. VV 29 in Context

In order to get a clearer understanding of what these passages might mean, it is important to consider them in the argumentative context in which they occur. The VV, which contains the first passage given above, is a work of seventy verses, accompanied by Nāgārjuna’s autocommentary. As its title—which translates as “The Dispeller of Objections”—suggests, its main aim is to answer objections which had been advanced concerning Nāgārjuna’s theses. Its being of a rather technical and specific nature makes it plausible to assume that the VV was written later than his main work, the MMK, and was meant to deal with particular problems arising from the arguments set out there.⁴ The first twenty verses and their commentaries contain criticisms of Nāgārjuna’s

2. che ba’i bdag nyid can de dag / rnams la phyogs med rtso pa med / gang rnams la ni phyogs med pa / de la gzhon phyogs ga la yod.

3. 6.54 My propositions serve as elucidations in the following way: anyone who understands me eventually realizes them as nonsensical, when he has used them—as steps—to climb up beyond them. (He must, so to speak, throw away the ladder after he has climbed up it.) [. . .] 7. Whereof one cannot speak, thereof one must be silent.

position, which are answered in the remaining verses and their commentaries. Verse 29, given above, specifically addresses the problem raised by the opponent in verse 4.

The principal point the opponent makes at the beginning of the VV concerns the status of Nāgārjuna’s claim of universal emptiness. The opponent argues that Nāgārjuna faces a dilemma whose horns are inconsistency and impotence. If he assumes his claim not to be empty, he has contradicted his own thesis of universal emptiness (because there is now at least one thing that is not empty). If, on the other hand, Nāgārjuna takes his own claim to be empty too, the opponent argues, this claim is then unable to deny the existence of independently existing phenomena that the opponent asserts. As becomes clear later in verse 22, Nāgārjuna accepts the second horn of the dilemma: everything is empty, and his claim that everything is empty is empty too. As he stresses in the next verse, this reasoning, however, does not entail that the claim could not carry out its philosophical function. A key can open a door in a film even though it is only a key in the film, not a real key.5 Verse 4 now considers a specific comeback Nāgārjuna could make in reply to the difficulty arising from accepting this second alternative, the charge of the argumentational impotence of his claim of universal emptiness. Nāgārjuna could argue that if universal emptiness renders his own claim impotent, the opponent’s claims, being also subsumed under the universal statement of everything being empty, are similarly impotent and therefore cannot act as a refutation of Nāgārjuna’s claim either. But as the opponent is quick to point out, this thinking involves a blatant petitio principii: only if we already accept that everything is empty will the opponent’s arguments be rendered empty and impotent. But this is exactly the thesis the opponent denies. For him at least, some things are not empty, and in particular his own statements are not subject to Nāgārjuna’s claim of universal emptiness. The difficulty the opponent raised is one that arises because of the specific character (laksana) of Nāgārjuna’s system, namely the claim that everything is empty. It does not apply to someone who does not make that assumption.

Verse 29 then is made in reply to this supposed counterargument and its rejection as a petitio. There Nāgārjuna claims that the particular defect (of his thesis of universal emptiness rendering his own philosophical assertions impotent) would indeed apply if he had any position. But given that he has no position, the difficulty therefore does not apply to him.

Now it will strike the reader that this is a rather curious reply to make. It is evident that the opponent’s criticisms formulated in verse 4 as well as in the preceding verses rest on a misunderstanding of the central term “emptiness.” What exactly this misunderstanding amounts to is less clear. In fact the above set of arguments would make sense if we assumed that the opponent understood “empty” to mean “false,” or “meaningless,” or even “nonexistent.”6 But as a reply to a criticism based on misunderstanding of this kind Nāgārjuna’s reply in verse 29 seems a little extreme, given that it would have been perfectly sufficient and far less controversial for him to point out that emptiness entailed neither falsity nor meaninglessness nor non-existence and that he thereby could assert that his claims both are empty and simultaneously are able to refute the opponent’s objections (in fact he makes exactly these points in verses 21 and 22). Even if we agree with Mabbett that it may be the case that the objection addressed by a given verse has already been essentially refuted, but in turning to each new objection Nāgārjuna seeks to make a fresh rebuttal in order to administer the coup de grâce7

Nāgārjuna here seems to use a sledgehammer to crack a nut. Why deny holding any proposition whatsoever if it would have been perfectly sufficient to point out that since “empty” does not mean “non-existent,” it is completely unproblematic to claim that one’s own position is as empty as everything else?

We can distinguish at least three different ways in which Nāgārjuna’s crucial statement that he has no position can be interpreted. I will refer to these as the semantic, argumentational, and transcendent interpretations. According to the semantic interpretation Nāgārjuna does not claim to hold no thesis whatsoever, but claims only to accept no statements that are taken to have a particular semantics. If we follow the argumentational interpretation, Nāgārjuna makes a claim about how one should proceed in debates, namely by always refuting

6. Indeed we might think that the argumentative context makes it most likely that the opponent misunderstands “empty” as “nonexistent.” In this case the problem that nonexistent statements cannot really refute anything seems to be most pressing. But in the case of the other two alternatives other problems become more serious. If Nāgārjuna meant “meaningless” when he said “empty,” his claim that everything is empty would obviously just be false, given that we perfectly well understand the claim he makes (in the same way as somebody saying “all statements, including this one, are not grammatically well formed” would be uttering a falsehood). If, however, “empty” meant “false,” Nāgārjuna’s thesis of universal emptiness would reduce to the liar paradox and there is no good textual evidence that this is the problem the opponent had in mind. On this last point compare also the discussion in Mabbett (1996) and Sagal (1992).

opponents via reductio arguments, without ever adopting any thesis oneself. The transcendent interpretation finally reads Nāgārjuna’s statement as the assertion of the existence of an inexpressible reality beyond concepts and language.

All three of these interpretations have historical predecessors in the commentarial tradition. The semantic and argumentational interpretation can be found in works of the dGe lugs tradition, in particular those of Tsong kha pa4 and mKhas grub rje,5 while a variety of views which can all be regarded as some kind of transcendental interpretation can be found in the writings of scholars like rNgo grol blo Idan shes rab,6 Go rams pa,7 and dGe ’dun chos ’phel.8 The following discussion will be restricted to an exposition of the semantic interpretation, primarily because this appears to give us the clearest understanding of the role of verse 29 in the context of Nāgārjuna’s arguments.

The argumentational and transcendent interpretations tend to use Nāgārjuna’s denial of a thesis as a textual peg on which to hang an argument concerned with quite different matters from those dealt with in the VV. Tsong kha pa, for example, refers to this verse in the context of expounding the distinction between Svātantrikas and Prāsaṇgikas; Sa skya Pandita9 offers the transcendent interpretation in the context of a debating manual (advising the reader on how to debate with somebody who does not put forward a position); dGe ’dun chos ’phel’s work, despite its title, is not a study of Nāgārjuna’s thought in particular, but is concerned mainly with criticizing the then prevalent dGe lugs interpretation of Madhyamaka philosophy more generally.

This is not to say, of course, that the argumentational and transcendent interpretations are for this reason deficient or lacking in interest within the context in which they are presented. However, it is important to be aware that these contexts were not Nāgārjuna’s context. There is certainly no reason for suspicion toward later Indian or indeed non-Indian works as not giving a valid interpretation of Nāgārjuna’s thoughts. Nevertheless, the most interesting of these for the present purpose of a philosophical analysis of Nāgārjuna’s thoughts are those that allow us to understand passages from his works in their argumentative context, rather than using them as a starting point for presenting their own ideas on a particular topic.

9.3. The Semantic Interpretation

If we consider the major dGe lugs pa commentaries on verse 29 it becomes evident that these usually regard Nāgārjuna’s statement as elliptical. What Nāgārjuna really means when saying that he has no position, these commentaries claim, is that he has no positions that are non-empty.14

The key to understanding the point made in these commentaries lies of course in a precise understanding of what it means for a position or statement to be empty. An object is empty if it does not exist from its own side and is therefore dependent on other objects, so that its existence is not grounded in its “own-nature” (svabhāva, rang bzhin). The Buddhist commentarial tradition considers a variety of dependence relations in which objects stand and which prevent them from existing in a non-empty way. These dependence relations include causal dependence, dependence of a whole on its parts, as well as dependence on a cognizing subject.15 While in the case of certain objects their independent existence seems at least a prima facie plausibility which the Mādhyamika then attempts to refute by appropriate arguments, the emptiness of statements appears to be entirely uncontroversial. Material objects might be considered to exist in causal and mereological dependence, but independent of a cognizing subject; abstract objects, platonistically conceived, will be assumed to be independent in all three ways. Statements, however, can hardly be taken to “exist from their own side” in any of the three senses.

As even Nāgārjuna’s opponent affirms in VV 1, token utterances are events that arise in dependence on causes and conditions like all other events. When we consider utterances as types, it is equally clear that, assuming a compositional semantics, these are mereologically dependent on their parts, since the meaning of the sentence type is a function of the meanings of its constituents or parts. Finally, considering a constituent like the expression “red,” we realize that its referring to the color red is no property the word “red” has independent of everything else: the connection of this particular phonetic or typographic object with the property is a convention that holds for speakers of English; for speakers of French the same property is connected (by a different set of conventions) with “rouge,” for speakers of Tibetan with “dmar po,” and so forth. That

14. “It is not being said that the Madhyamika has no theses; he merely has not theses that inherently exist.” Hopkins (1983: 471). The same point is made in mKhas grub rje’s commentary on this passage; see Ruegg (2000: 179).
“red” refers to the color red depends on a complex framework of conventions connecting a community of cognizing subjects that share a language. Unless we mistakenly consider “empty” to mean “false” or “meaningless” or “nonexistent,” the claim that utterances conceived of as either tokens or types are not empty seems to be a position it is hard to make sense of.

Despite the prima facie strangeness of their claims, theories of the nonemptiness of language have found their defenders. Perhaps the most extreme example is the view of language defended by the Mīm. āmsākas.\(^\text{17}\) A primary motivation of the Mīm. āmsā theory of language was to provide a justification of the authoritative status of the Vedas. As opposed to the Naiyāyikas, who justify the Vedas by their divine authorship, the Mīm. āmsākas regard them as authorless (apaurusêya). The elements of the Vedic language are assumed to exist eternally, without the necessity of a speaker. Any particular human utterance of course depends on a phonetic or typographical instantiation of a piece of language, but the types thus instantiated exist ante rem, without depending on the tokens instantiating them. The referents of expressions, which the Mīm. āmsākas take to be eternal and unchanging universals, are related to these expressions via a set of objective and necessary relations.\(^\text{18}\)

While the Mīm. āmsā view of language attracted plenty of criticism from the Buddhist side (centred around Dignāgas apoha theory).\(^\text{19}\) there is no good evidence that this is the view Nāgārjuna’s opponent in the VV wants to defend.\(^\text{20}\)

There is, however, some interesting evidence that at least some of Nāgārjuna’s Indian commentators saw him as opposed to similar conceptions of language. When commenting on MMK 2:8 in his Prajñāpradīpa, Bhāviveka raises the question why the verbal root gam, “to go,” is used in its ātmanepada form “gacchate” rather than being conjugated in the usual parasmaipadu manner as a “gacchati.”\(^\text{52}\) Bhāviveka lists a variety of quotations from Indian grammarians illustrating the perils of wrong grammar. When the god Tvaśtr created a serpent to destroy Indra, he exclaimed indraśatrur vardhasva, intending to say “May you prosper, destroyer of Indra!” Since he intended the compound to be a tatpurusā, it should have been stressed on the ultimate syllable. Unfortunately Tvaśtr stressed it on the first syllable, turning it into a bahavrīhi meaning “having Indra as a destroyer.” The words did what they meant rather than what Tvaśtr intended them to mean, and Indra destroyed the snake, not the other way round.\(^\text{21}\) Bhāviveka then continues to observe that Nāgārjuna’s irregular use of gacchate not only was intentional, but served a philosophical purpose. By demonstrating that no disaster would strike from an irregular use of grammar, Nāgārjuna was aiming to convince his opponents to give up their attachment to mere words, together with the assumption that there was a substantial nature (svārūpa) of words which determined that they could appear only in certain grammatical forms.\(^\text{22}\)

Nevertheless, for the purposes of interpreting the VV it makes better systematic sense to ascribe a different (and less extreme) theory than that to Nāgārjuna’s opponent. According to this theory, whether a statement is empty or not does not depend on the mind-independent existence of language in some Platonic heaven but on the semantics we employ when interpreting the statement. Even if we accept that the link between “red” and the property of redness is conventional, this fact does not imply that we also think that the property of redness only has conventional existence as well. It can still be a property that exists in the world independent on human conventions and intentions. Moreover, even if the linkage of particular words to their referents should prove to be conventional, the linkage of entire sentences to the world might not be. For example we might suppose that the statement “The apple is red” linked to the state of affairs it refers to by a relation of structural similarity, by their sharing of a common logical form, which in turn is not a product of convention. Once we have linked up the simple signs of our language with the simple objects in the world, we then do not need a further set of conventions to link up the complex signs (the sentences) with the complex objects (facts or states of affairs), in the same way as once we have settled by convention how the different chessmen are to move we do not have to bring in further conventions to decide whether a particular distribution of chessmen on the board will allow white to mate in five moves. This can be decided just by reference to the initial conventions, and in the same way the truth-conditions of a sentence such as “The apple is red” can be worked out by considering the simple signs it is made up of and how these are put together in the sentence.

\(^{22}\) Ames (1995: 342, n. 65). Notes 64–70 provide very useful information for identifying some of the authors Bhāviveka quotes.

In fact both the assumptions behind this picture of the non-emptiness of statements—the assumption that there is a “ready-made world,” to borrow a phrase of Putnam’s, and the assumption that there is a structural link between language and the world—are extremely widespread, so widespread indeed that we might refer to them jointly as the “standard picture.” This standard picture provides us with a good idea of what is meant by the notion of *svabhāva* in the context of language, as opposed to an ontological understanding of *svabhāva* in terms of substance, or a cognitive understanding in terms of a superimposition (samāropa) which conceptualizes objects as permanent and observerindependent. The standard picture therefore represents the third, the semantic dimension of *svabhāva* mentioned in chapter 2.

It is evident that the standard picture does not sit well with the thesis of universal emptiness. Neither the existence of a world sliced up “at the joints” into particulars and properties nor the existence of an objective structural similarity between sentences and the world would be acceptable for the Mādhyamika. A Mādhyamika-compatible semantics would deny the existence of a world differentiated objectively into different logical parts and would try to replace the structure-based picture of the language-world link by a different one, perhaps by a theory built on speaker conventions.

There is good historical evidence that the standard picture is indeed what Nāgārjuna’s opponent presupposes if we take into account how closely many of the arguments in the VV engage with the NS. Garfield24 points out:

[In the Nyāya-influenced logico-semantic context in which these debates [in the VV] originate the dominant view of meaningful assertion (the one that Nāgārjuna calls into question) is one that from our vantagepoint best be characterized as a version of Fregean realism: meaningful assertions are meaningful because they denote or express independently existent properties. A proposition is the pervasion of an individual entity or groups or entities by a real universal or sequence of universals.]

On this understanding of the emptiness of statements we can read the opponent as claiming in VV 1 that because of Nāgārjuna’s thesis of universal emptiness, the Mādhyamika cannot accept the standard semantic interpretation for his utterances. For Nāgārjuna both questions of ontology (how the world is sliced up) and of semantics (how language and the world are linked)

must be settled by appeal to conventions. The opponent, on the other hand, can assume that there is a “ready-made world,” as well as an objective, structural way of linking this to our language.26 Now the opponent argues that on this picture Nāgārjuna never gets out of his system of conventions to connect his claims with the things—and that is the reason why his claims are unable to refute the opponent’s claims, which manage to connect with the things. Nāgārjuna’s arguments can no more refute the opponent than the rain in a meteorological simulation can moisten real soil.27 Nāgārjuna’s opponent thus considers the interesting case of a language in which we have two kinds of statements: some are interpreted according to the standard semantics (referring via an objective reference relation to objects that exists independently of us), some are interpreted according to Nāgārjuna’s semantics (which does not make these assumptions). The opponent argues that statements of the second kind could not possibly influence the first kind. To see this point, consider a similarly structured case. Assume we recognize two kinds of norms, norms that are real, objective, “out there,” and norms that are the product of human convention. (Moral realists take certain ethical norms to be of the first kind, rules for the regulation of traffic are generally considered to be of the second kind.) Now it is clear that although the two kinds of norms could be in conflict, a norm of the second kind could never override one of the first kind, since the former are part of the objective normative framework of the world while the latter are only a supplement of human design.

Although he does not explicitly say so, Nāgārjuna’s arguments seem to imply that he agrees this situation would indeed be problematic. If there are two kinds of statements, the latter would be as impotent compared to the former as a film would be to reality: we could not escape the burning cinema by entering the scene projected onto the wall. Nāgārjuna counters the charge of impotence by denying that there are two kinds of statements, which differ like film and reality. All statements are to be interpreted in the same way, so that their interaction is not ontologically any more problematic than the interaction of different characters in a film.28

26. Another manifestation of the Naiyāyika opponent’s conception of a harmonious word-world link is the view that the simple terms of our language cannot fail to refer (as is discussed in chapter 3).

27. In VV(S) 43:2–6 the opponent claims, that “A fire that does not exist cannot burn, a weapon that does not exist cannot cut, water that does not exist cannot moisten; similarly a statement that does not exist cannot deny the *svabhāva* of all things.” na hy asatāgūṇinā śakyaṁ. daydhum | na hy asatā śastreṇa śakyaṁ. chettum | na hy asatābhir adhiḥśaktamkledayitum | ēvaṃ asatā vacanena na śakyaḥ. sarvabhāvasvabhāvapraśīṣedhay. kartum.

28. See particularly VV 23, 27; MMK 17:31–33.
of the argument in VV 4. Remember that there the opponent claims that Nāgārjuna might want to say:

According to this very method, a negation of negation is also impossible; so your negation of the statement negating the intrinsic nature of all things is impossible.\(^{29}\)

The opponent has just claimed that because Nāgārjuna’s theory entailed a nonstandard semantics, his assertions did not manage to connect with the world and were therefore meaningless. But if the opponent then sets out to refute the thesis of universal emptiness, this attempt means either that he takes it to be meaningful after all (and therefore deserving refutation) or that the statement he wants to defend (which is the negation of Nāgārjuna’s claim) is meaningless as well, since plugging in the word “not” will not help to turn nonsense into sense.

The opponent could reply to this charge by pointing out the difference between internal and external negation. While it is plausible to assume that the internal negation of a nonsensical statement is nonsensical too (“the number seven is not yellow [but rather some other color]” is as problematic as “the number seven is yellow”), this is not the case for an external negation (“it is not the case that the number seven is yellow” is not just meaningless but also generally taken to be necessarily true). Nāgārjuna’s opponent could then claim that his negation of the claim of universal emptiness is external only and therefore not affected by the lack of meaning in the claim it negates.\(^ {30}\)

It is possible that the opponent had argued like this because a distinction between the different scopes of negation, as well as between the accompanying presuppositional and nonpresuppositional readings, was made in the philosophical literature of the time.\(^ {31}\) It has to be noted, however, that the passage in question fails to make any direct reference to different kinds of negation being involved.\(^ {32}\)

A more abstract way of employing the distinction between the two kinds of negation in the opponent’s reply consists in rejecting Nāgārjuna’s peculiar semantics. Here the opponent points out that he does not have to accept Nāgārjuna’s semantics, since it is a particular characteristic (laksana) of Nāgārjuna’s

\(^{29}\) pratisedhayapratisedho ‘py anenaiva kalpenanupapannah, tatra yaddhavan sarvabhaavasyapratijnanupapannam, pratisedhayati tad anupapannam iti. VV(S) 45:16–18.

\(^{30}\) Garfield (1996: 12) reads the argument in this way and argues that the opponent just wants to negate Nāgārjuna’s position, without asserting the contrary.

\(^{31}\) For present purposes we can assume a (simplifying) identification of paryudāsa with internal negation and of prasajyapratisedhu with external negation. For further differentiation, see Ruegg (2002: n. 6, 19–24) as well as the discussion in chapter 4, section 4.1.

\(^{32}\) Compare also the discussion in Ruegg (2000: 117).

system but nothing the opponent would be forced to take on board.\(^ {33}\) The opponent negates not just Nāgārjuna’s claim of universal emptiness, but the entire non-standard semantics which comes with it. If prasajya-negation is seen as a presupposition-cancelling negation which negates not just a proposition but also that proposition’s presuppositions,\(^ {34}\) and if the semantics according to which a speaker wants the set of his utterances interpreted is included among these presuppositions, denying a claim together with the semantics it comes with can be regarded as an example of prasajya-negation.

9.4. The Specific Role of Verse 29

It is interesting to note that verse 29, which is meant to be a reply to the opponent’s argument given in verse 4, does not attempt a comeback in trying to argue that the opponent’s negation of Nāgārjuna’s claim of universal emptiness is somehow impossible after all. Instead Nāgārjuna addresses a difficulty (doṣa) arising from the “specific character” of his system which the opponent raises at the end of verse 4.

In mKhas grub rje’s sTong thun chen mo, an influential dGe lugs commentary which deals with the interpretation of this passage,\(^ {35}\) this difficulty is taken to be inconsistency. If Nāgārjuna assumed that his thesis of universal emptiness was non-empty itself (rang bzhin gyis yod pa) and, on our interpretation, would therefore have to be supplied with a semantics according to the standard picture, his position would be inconsistent (at least until he proposed a special reason why this statement should be excepted, which Nāgārjuna does not do). But, mKhas grub rje argues, since none of Nāgārjuna’s claims of universal emptiness are taken to be non-empty, the difficulty of inconsistency does not arise.\(^ {36}\) The same point is made by Tsong kha pa.\(^ {37}\)

Therefore, the issue as to having or not having theses is not an argument about whether [Nāgārjuna] has them in general. It is an

\(^{33}\) “The objection applies only to the specific character of your proposition, not to that of mine. It is you who say all things are void, not I. The initial thesis is not mine,” tava hi pratijñālakṣāprāptam. na mama | bhavān bravīti śūnyāh. sarvabhāvā iti nāham | pūrvakah. paks.o na mama. VV(S) 45:19–66:2.

argument as to whether the words of the thesis “all things lack intrinsic nature” have intrinsic nature. [Therefore the meaning of the lines from the VV is this:] If I accepted that the words of such a thesis had an intrinsic nature, then I could be faulted for contradicting the thesis that all things lack intrinsic nature, but because I do not accept that, I cannot be faulted.

What is unsatisfactory about this interpretation is that Nāgārjuna has already made the point ascribed to him here in verse 22. There he claims that his claim of universal emptiness is also empty, and he gives reasons why he thinks it can still have argumentative force, thus avoiding the charge of impotence. Unless we assume Nāgārjuna to be unnecessarily repetitive, it is not clear why we should assume that he makes the very same point once again a couple of verses later, and also formulates it in a much more obscure manner than the first time.

It is important to note that verses 21–28, which deal with the objections raised in the first three verses of the VV, are concerned primarily with solving the dilemma of inconsistency and impotence which is faced by Nāgārjuna’s claim of universal emptiness. Verse 29, however (pace mKhas grub and Tsong kha pa), is not again concerned with the thesis of universal emptiness. Nāgārjuna realizes that the twin problem of inconsistency and impotence is a problem not just for his thesis of universal emptiness, but for any other claim he holds as well. Any other claim either will face the problem of being a counterexample to Nāgārjuna’s assertion that all claims should be given a non-standard semantics, or will fail to connect with the world in the way sentences with the standard semantics do, and will therefore be meaningless. I want to argue that this is the difficulty arising from the “specific character” of Nāgārjuna’s system to which the opponent refers in verse 4 and which Nāgārjuna takes up again at the beginning of verse 29. He is not interested in defending the claim (attributed to him by the opponent in verse 4) that his thesis of universal emptiness could not possibly be negated. Instead he takes up the opponent’s more important point that apart from defending his claim of universal emptiness from the twin problems of inconsistency and impotence, he should better say something about the status of his other assertions as well. This is why he says in verse 29 that none of his other assertions should be regarded as propositions with standard semantics (pratijñā) either.

The plausibility of this interpretation rests on there being two meaning of “thesis” (pratijñā) in play here, one referring to theses with standard semantics (which Nāgārjuna rejects) and one referring to theses with nonstandard semantics (which Nāgārjuna does not reject). In fact there appears to be good textual evidence that the notion of “thesis” is indeed used in two different ways in Madhyamaka literature.

Candrakīrti’s commentary on Nāgārjuna uses one sense of thesis (pratijñā) to refer to statements with clearly unproblematic status; indeed some utterances by Nāgārjuna himself are regarded as theses in this way, while theses in another sense are firmly rejected. We might want to refer to the first kind of theses as propositions, and to the second as views. How are we to understand the distinction between them? It has been claimed that views are theses with philosophical or metaphysical commitments and, more specifically, that they postulate an independently existing entity (bhāva). Propositions, on the other hand, do not make such commitments and are therefore philosophically unproblematic. It is important to note at this point, however, that what distinguishes a view from a proposition is not just that the former asserts the existence of objects existing by svabhāva while the latter does not. On this understanding the statement “Object x does not depend in any way on any other object” would be a view concerning x, while “Object x stands in a variety of dependence relations with other objects” would not be. Ontological commitment comes into play only at the level of semantics. Whether someone asserting that the average man has 2.4 children is committed to an object that acts as the reference of the expression “the average man” depends on the semantics given. If we interpret the statement in the way statements such as “Paul has two children” are usually interpreted, such commitment to a strange man with partial children ensues; if, on the other hand, we read it (more plausibly) as a statement about ratios between the number of men and children in a certain set, there is no such commitment.

It therefore seems to be plausible to take the distinction between views and propositions and between theses with standard and non-standard semantics as coinciding. The views the Madhyamika rejects are theses that are interpreted by referring to a ready-made world and a structural link between this world and our language. The propositions he takes to be unproblematic, and some of which he holds himself, are theses that are given a semantics that makes neither of these two assumptions.

39. For example, MMK 1:1 in PP 13:3. See Ruegg (1983: 213–214) for further examples. Oetke (2003: 458–459), however, argues that the distinction between two senses of pratijñā arises only in the later Prāsanagika literature and should not be read back into Nāgārjuna’s works.

Some support for this semantic interpretation of the difference between the two senses of “thesis” can be gained from MMK 13:8:

The Victorious Ones have announced that emptiness is the relinquishing of all views. Those who in turn hold emptiness as a view were said to be incurable.\(^{42}\)

Although Nāgārjuna does not use the word *pratijñā* for “view” but rather talks of *dṛṣṭi*, it seems sensible to treat the two terms as synonymous in this context.\(^{43}\) If the difference between propositions and views just depended on what the statement asserted, statements asserting the emptiness of some phenomenon such as “each spatio-temporal object depends causally on some other object” *ex hypothesi* could not be views, contrary to what Nāgārjuna says in the verse just cited. If, however, we treat “view” as denoting a statement together with the standard semantics, this is indeed possible. For if we read “each spatio-temporal object depends causally on some other object” as asserting the existence of various objectively existing individuals in the world, linked by a relation of causation, about which we speak by exploiting an objectively obtaining structural similarity between language and the world, it would indeed be turned into a view.

That the point at issue here is a specific (and, as Nāgārjuna sees it, inappropriate) conception of semantics is supported by Candrakīrti’s commentary on this verse. Candrakīrti argues that one taking emptiness to be a view is like one who, when being told by a shopkeeper that he has nothing to sell, asks the shopkeeper to sell him that nothing. The customer (like the White King in *Alice Through the Looking-Glass*) treats “nothing” like a proper name and therefore expects it to denote a particular object, as proper names do. But though this view is justified by the surface grammar of the sentence concerned, it does not lead to an understanding of what the merchant wants to say. Similarly, giving a standard semantical interpretation of statements asserting emptiness does not lead to an understanding of what Nāgārjuna wants to say.\(^{44}\)

The semantic interpretation outlined above provides a good way of making sense of verse 29 within the argumentative structure of the VV and also

\(^{42}\) sānyatā sarvadṛṣṭiṁān. proktā nih. saraṇām. jinaih. / yesām. tu sānyatādṛṣṭis tān asādhyān babhāyire.

\(^{44}\) This interpretation does not imply, of course, that one could hold “any position at all” as long as one gives it the required nonstandard semantics, as Galloway (1989: n. 5, 27) asserts. A statement such as “Things arise from what is other than themselves” will be regarded as false by Nāgārjuna, independent of whether it is interpreted according to the standard or the non-standard semantics.

CANDRAKĪRTI COMMENTARY

[Chapter V]

Some might interject here that although motion, the one in motion and the space traversed do not in fact exist, nevertheless the existence of the one who sees, the object of sight and seeing itself should be accepted because this is established in the authoritative commentaries (Abhidharma). There it is said,

KALUPAHANA COMMENTARY

Chapter Three Examination of the Faculty of Eye
(Caksur-indriya-pariksa)

GARFIELD COMMENTARY

Chapter III Examination of the Senses

In this chapter, which is most immediately about vision, Nāgārjuna really addresses the status of sense perception generally, as he makes clear in the opening and closing verses. Just as in Chapter II, where the target positions Nāgārjuna argues against are positions according to which motion and the mover inherently exist as distinct, independent, but somehow related entities. For we do perceive motion and change, and the argument for the conventional existence of motion did suggest that it could be seen as a relation between the positions at which we perceive objects at different times. So one can imagine an opponent saying, “Even if the motion we perceive is not real, the perception must be.” Again, it will be important for Nāgārjuna that his analysis of perception as empty of inherent existence, and as merely dependently arisen, does not entail its complete nonexistence. He must, that is, steer a middle path between reification and nihilism using emptiness as his compass.

ENGLISH TRANSLATIONS

INADA (Skt):  
Verse 1 - The six sense faculties are seeing, hearing, smelling, tasting, touching, and thinking. These have their respective fields of action, such as, what is to be seen, etc.

JONES (Skt):  
[i] The six senses are seeing, hearing, smelling, tasting, touching, and the mind. Their domains are what is seeable, and so forth.

KALUPAHANA (Skt):  
Seeing, hearing, smelling, tasting, touching, and mind are the six faculties. Their spheres consist of the object of seeing, etc.

MCCAGNEY (Skt):  
Seeing, hearing, smelling, tasting, touching, and thinking are the six faculties and the sphere, their objects of seeing, etc.

NISHIJIMA (Skt?):  
1. Function to see, function to hear, function to smell, Function to taste, function to touch, and function of central sense perception.  
Those six kinds of sense functions are very familiar to us, And what has been seen, and so forth, are the objects of sense functions.

SPRUNG (Skt):  
1 Vision, hearing, smell, taste, touch, thought are the six senses. Their objects are the visible, the audible and so on.

STRENG (Skt):  
1. Vision, hearing, smelling, tasting, touching and thought Are the six sense faculties. The area of their concern is that which is seen heard, smelled and so forth.
PINGALA COMMENTARY

3/1 In this case, the eye constitutes the inner faculty and form the outer object, and the eye can see forms, and so on up to mind is the inner faculty, dharmas the outer object and the mind cognizes dharmas.

Reply: Not so, and why?

CANDRAKĪRTI COMMENTARY

It follows that vision and the other senses are self-existent.

The concept of vision is unintelligible

KALUPAHANA COMMENTARY

Although the traditional Adhidharma classification lists the "aggregates" (skandha), "spheres" (ayatana), and "elements" (dhatu) in that order, for Nagarjuna, the epistemology, the faculties (included under spheres) were more important, primarily because of the current controversies surrounding the concept of existence (dharma). Furthermore, even in the discussion of faculties, Nagarjuna was not so much interested in the faculties per se, for there was not much controversy regarding the eye, etc. No school doubted the existence of these faculties. The controversies were centered more on the function of the faculties, that is, with regard to seeing, hearing, smelling, tasting, touch, and thinking. For this reason, after providing a title for the chapter as "Examination of the Faculties" (Indriya-pariksa). Nagarjuna immediately moves on to an analysis of the more complicated issues relating to their functions. Hence the reference to seeing, hearing, etc., especially as means of identification of events (see, e.g., P. F. Strawson, Individuals, New York: Doubleday, 1963, p ff.) that is so important for an empiricist like Nagarjuna. Even among these various faculties and their functions, the most important epistemological issues were connected with seeing. Hence Nagarjuna's interest in the problem of seeing or visual perception. Note that the term manah is used here to refer to the function, even though manana would be more appropriate in the context. This may have been done to preserve the metre.

GARFIELD COMMENTARY

1. This is a standard Buddhist catalog of the sense faculties. It differs from the standard Western catalog only in that the Buddhists regard introspection literally as an inner sense with the same epistemic structure as outer senses and presumably subserved by analogous physical structures. Nāgārjuna will not dispute the reality of these faculties or of their respective spheres. But he will insist that that reality must be characterized interdependently and conventionally.

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 2 (Nagarjuna asserts) - The seeing activity, indeed, does not see its own self. If it cannot see its own self, how is it possible to see other (things).

JONES (Skt):
[2] Seeing does not see itself. How can what does not see itself see other things?

KALUPAHANA (Skt):
Seeing does not perceive itself, its own form. How can that which does not perceive itself, see others?

MCCAGNEY (Skt):
Indeed, seeing does not see itself. How can that which does not see itself see others?

NISHIJIMA (Skt?):
2. The function of our own mind is also the object to be seen, Because even the subject to see and the object to be seen are both actually the objects to be seen. What can not be seen has been our own mind, Why such a concrete thing has become to be seen so distant?

SPRUNG (Skt):
2 Vision does not see itself. How can something which does not see itself see other things?

STRENG (Skt):
2. Certainly vision does not in any way see its own self. Now if it does not see its own self, how can it possibly see something else?

ROBINSON (Skt):
Seeing does not see itself. When it does not see itself, how can it see others?
PINGALA COMMENTARY

3/2 The eye cannot see its own self. Why not? Just as a lamp, shining by itself is able to illuminate something else, so the eye, if it had this characteristic of seeing, should see both itself and other things. But in fact this is not the case. So, in the verse he says, when the eye does not see itself, how can it see other things?

CANDRAKĪRTI COMMENTARY

He means that the very act of vision does not see itself because it is contradictory that an act (kriya) should be directed at itself. It follows from vision not seeing itself that it does not see colours and such things; and hearing and the other senses are the same. There is, therefore, no such thing as vision.

KALUPAHANA COMMENTARY

Nagarjuna was clearly aware of the major controversy raging among the adherents of the various "essentialist" schools regarding the problem of perception. In their search for certainty, these essentialist schools assumed that in any act of perception the "most clear and distinct" is the perception of "oneself." (see Brhadaranyaka Upanisad 1.4.1). "I think, therefore, I am" (cogito ergo sum) was the premise with which the essentialist thinkers of pre-Buddhist India began their exposition of perception. The Buddha was himself aware of the difficulties involved in such an assumption when he advised his disciples not to follow such speculations (manta asmiti sabbam uparundhe, Sn 916). While the Buddha was willing to recognize consciousness or "self-consciousness" (vinnana, vijnana) as an important constituent of the human personality as well as its experiences, he was not willing to assume a metaphysical substratum such as the "self" or "I" as being the object of such awareness. He was clearly aware that this latter epistemological method was the source of most obsessive conceptions (mulam papancasankhaya, ibid.). However, the later Buddhist metaphysicians, innocently unaware of the implications of such a method, seem to have been led in that direction, thereby dragging themselves into the quagmire of svabhava-metaphysics from which they could not easily get out. The result was the description of perception in the Vibhasaprabhavrtti (p. 32):

The substance called the eye is of the nature of that which sets. In it is produced an action of seeing, when its power is awakened on account of the emergence of the totality of its causes and conditions. The eye does not apprehend independently of consciousness (vijnana), not does eye-consciousness know the object unsupported by the active eye. Eye as well as eye-consciousness, with the help of accessories such as light, cooperate simultaneously toward bringing the perception of an object. The object, the eye, the eye-consciousness, and the light, cooperate simultaneously toward bringing the perception of an object. The object appears, the eye sees, and the eye-consciousness knows it. This is called the direct knowledge of an object. [Emphasis mine] Reading through the present chapter of Nagarjuna, one can hardly miss the target of his criticism if one were to keep in mind the above passage of the Vibhasaprabhavrtti. These problems will be discussed in their contexts. However, before taking up the metaphysical issues involved in the above sort of description, Nagarjuna needed to eliminate the very source of such metaphysics, namely, the cogito. For Nagarjuna, the method by which one arrives at the cogito not only leads to the belief in a "sva atman", but also the sharp dichotomy between "self" (sva atman) and "other" (para atman). Therefore, having stated positively that there is no "seeing of oneself" (svam atmanam darsanam), Nagarjuna raises question as to the possibility of "seeing an other" (param). Thus, the dichotomy between self and other in a more metaphysical form is not only ethically unacceptable, but also epistemologically unfounded.
2. This cryptic argument is aimed at any theory according to which vision is inherently existent. The idea is this: If the visual faculty were to be inherently existent, then seeing would be its essence. Its action would hence require no distinct conditions and no external object to be seen. That is, if vision were inherently existent, vision would occur simply in virtue of the existence of the visual faculty. Suppose then that there is an inherently existent visual faculty and no external sense object for it. It would then have only itself as a possible object of sight, yet it would be seeing and so would have to be seeing itself. Therefore, Nāgārjuna argues, a view of vision as inherently existent would entail the possibility of visual apperception. But there is no such possibility. So the fact that vision can see other things cannot be in virtue of its containing percipience as an inherent property.

There is also a plausible Pyrrhonian interpretation of this verse: The point of a sensory faculty is to make knowledge possible. But that is only possible if the data the faculty provides are themselves perceived. But the data that the visual faculty delivers are visual. If they themselves are to be perceived, one would require either another visual faculty, hence generating a vicious regress, or apperception by vision, which is absurd. The point is not then that vision is impossible, but rather that visual perception - or any kind of perception - can only be completely explained and characterized by reference to things outside of the visual faculty itself. Vision is relational, and not an intrinsically identifiable phenomenon. (fn 40. I am indebted to the Yen. Gen Lobzang Gyatso for my reading of this verse. Kalupahana (1986) reads this quite differently - as an empiricist rejection of a Cartesian cogito argument. While I agree that Nāgārjuna has no sympathy with a Cartesian position, to see this verse as articulating an empiricist view with regard to self-knowledge seems unmotivated.)
INADA (Skt):
Verse 3 - The example of the fire (i.e., which burns material but does not burn itself) is not adequate enough to establish the seeing activity. The fire example and the seeing activity can be refuted (analogically) by the concepts of "present passing away," "that which has transpired," and "that which has not transpired."

JONES (Skt):
[3] The counter-example that fire can burn other things but cannot burn itself does not apply. Rather, the above analysis of motion applies to both fire and seeing.

KALUPAHANA (Skt):
The example of fire is not adequate for the establishment of seeing. That [fire] together with seeing are refuted by [a refutation of] the present moving, the moved and the not moved.

MCCAGNEY (Skt):
The example of fire [which burns but does not bum itself] is not sufficient for the explanation of seeing.
That, and seeing, is refuted by the already gone, the present process of going and the not yet gone.

NISHIJIMA (Skt?):
3. What we have got relying upon our own enormous efforts, Are different from a simple fire, which we have got easily, What has been seen is perfectly opposite to what has been spoken.
What have been spoken are usually very abstract like "Is Going," "Have gone," or "Haven't gone yet."

SPRUNG (Skt):
3 The example of fire is not conclusive for proving the reality of vision. Like vision it is refuted by the analysis of movement, past, present and future.

STRENG (Skt):
3. An understanding of vision is not attained through the example of fire which, itself, burns. On the contrary, that example of fire together with vision is refuted by the analysis of "present going to," "that which is already gone to," and "that which is not yet gone to."

BOCKING (Ch):
3v3 The example of fire cannot establish anything About eyes and seeing
In the contemplation of present, past and future going
We have already dealt with this topic.

BATCHelor (Tb):
The example of fire is not able to fully establish seeing. It, along with seeing, has been refuted by "gone", "not gone" and "going."

DOCTOR (Tb):
A solid establishment of sight cannot Be provided through the example of fire.
With what was, has yet to be, and is being traversed We have replied to that along with sight. [III.3]

GARFIELD (Tb):
3. The example of fire Cannot elucidate seeing.
Along with the moved and not-moving and motion That has been answered.

GARFIELD-SAMTEN (Tb):
3. The example of fire Cannot elucidate seeing.
That, along with seeing has been dealt with Through the analysis of the gone, the not-gone, and the going.

HAGEN (paraphrase):
The example of fire does not explain seeing. Fire, as well as seeing, are refuted as present moving, the moved and the not-moved are refuted.
Although you offer the example of fire, this cannot illustrate anything about eyes and seeing. This topic has already been dealt with in the chapter on going and coming. Just as in what has already gone there is no going, and in what has not yet- gone there is no going and in the moment of going there is no going, so in the already-burnt, not-yet-burnt and moment of burning there is no burning at all. Likewise in the already seen, the not-yet-seen and the moment of seeing, no characteristic of ’seeing’ can be found at all. Again.

CANDRAKĪRTI COMMENTARY

3ab The example of fire is not conclusive for proving the reality of vision.

Nagarjuna means that the example of fire adduced to prove the reality of vision is not conclusive, that is, it is not appropriate, not adequate and is not logically tenable. For

3cd Like vision it is refuted by the analysis of movement, past, present and future.

‘Like vision’ means ‘along with vision’. This example of fire adduced to establish the reality of vision is refuted, along with vision, for which it stood as the example. You may ask how it is refuted. By the analysis of movement, past, present and future: what has been traversed is not in motion, nor is what has not been traversed, nor is what is being traversed. The same can be said of fire: what has been burned by fire is not being burned nor is what has not been burned, and so on (fn 1 See Chapter XI, ’Fire and Fuel’). As what has been traversed, what is at rest, and what is traversing are not in motion, similarly: ‘Neither what has been seen nor, emphatically, what has not been seen is being seen. And what is just being seen, as something wholly other than the seen and the not seen, is not being seen.’ (fn 2 This quotation has the form of a kārikā, but it is not so treated by Candrakīrti.)

As was said, ‘The mover does not move’, and so on, so it can be said ‘the agent of burning is not burned’, and so on. Similarly ‘the one seeing does not see’, is entailed, on the model of fire, by the analysis of motion. As there is the same fault, the proof of the reality (siddhi) of vision makes as little sense as the proof of fire. So it is established that, as vision cannot see itself, it cannot see other things either. This being so, then

KALUPAHANA COMMENTARY

While those who accepted the cogito assumed that seeing oneself precedes any act of seeing, their opponents seem to have used the example of the fire to maintain that, like fire which burns everything but itself, seeing perceives everything else but itself.

The theory of moments (ksana) that led to metaphysics in the sphere of causation (Chapter I) and change (Chapter II) did not leave the problem of perception untouched. Indeed, it was the problem of perception that was most affected by a theory of moments, as is evident from the variety of contradictory theories of perception presented by the Sarvastivadins, the Sautrantikas and the Theravadins (see Kalupahana, Buddhist Philosophy, p).

GARFIELD COMMENTARY

3. This is a reply to a standard substantialist counterexample to a Madhyamika analysis, specifically: Fire burns other things, but does not burn itself. And it can be intrinsically identified. Perhaps then vision is like fire, in that it can see others but not itself, while it does not need to be relationally identified. This example is a standard in early Buddhist debates about intrinsic versus relational identity, and Nāgārjuna devotes an entire chapter to its refutation as a dialectical device (Chapter X), arguing there that fire cannot be intrinsically identified. But at this point, he is willing to
grant the opponent that premise for the sake of argument. For, he claims, its utility as an analogy has already been undermined by the argument in the second chapter.

How? Whatever fire is burning must be burned in the past, the future, or the present. But, as with motion, burning cannot be, by its very nature, in the past, on pain of regress. Nor can it be in the future for the same reason. But burning cannot take place in the present either, for there is not enough time in an instant for anything to burn. Mutatis mutandis for vision. In the case of vision, for Nāgārjuna, there is a further problem with vision of another in the present. The visual process - and any sensory process - takes time. So if vision is seeing another thing, the other thing is already past. The only thing that vision could see in the present is a visual sense-impression. But then we are back to the problem of visual apperception. So even if fire were intrinsically identifiable, there is no point at which it could burn another. And if vision were intrinsically identifiable, there would be no moment at which it could see another.
Kārikā III.4

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 4 - As a seeing activity which is presently not seeing is nonexistent, how is it justifiable to speak of a seeing activity which sees?

JONES (Skt):
[4] When no seeing exists at all that is not currently occurring, how can we say that “seeing sees”?

KALUPAHANA (Skt):
When some form of seeing that is not perceiving does not exist, how pertinent is the view that seeing perceives?

MCCAGNEY (Skt):
If there is seeing which is not presently in the process of seeing, then how can this statement “seeing sees” obtain?

NISHIJIMA (Skt?):
4. The situations, which are different from what we are just looking at something, can never exist actually.

In such a situation, the ability to look at things and phenomena, can never exist at all.
The function to see, has ability to look at like this,
Therefore how is it possible for the facts here can be attached actually?

SPRUNG (Skt):
4 As there can be no vision at all which is not actively seeing, how can it make sense to say vision sees?

STRENG (Skt):
4. When no vision occurs, nothing whatsoever is being seen. How, then, is it possible to say: Vision sees?

BOCKING (Ch):
3v4 Seeing, before the moment of seeing, is not called seeing.
But you say that 'seeing' can see.
This is not so

BATCHelor (Tb):
When not seeing the slightest thing, there is no act of seeing. How can it [then] be reasonable to say: “seeing sees”?

DOCTOR (Tb):
When nothing at all is seen,
Neither is there one that sees.
“Sight is what performs seeing”
How could this be right? [III.4]

GARFIELD (Tb):
4. When there is not even the slightest Nonseeing seer,
How could it makes sense to say That seeing sees?

GARFIELD-SAMTEN (Tb):
4. When there is not the slightest seeing, There is no seer.
How could it makes sense to say That in virtue of seeing, it sees?

HAGEN (paraphrase):
When there is no seer who does not see, what sense would it make to say that seeing sees?
PINGALA COMMENTARY

3/4 When the eye is not yet confronted with the visible form, then it cannot see it. At this juncture we do not call it 'seeing'. It is because of the confrontation with form that we call it 'seeing'. This is why it says in the verse: before there is seeing, there is no seeing. So how can we see by means of seeing? Moreover, within these two events there is no dharma of seeing, and why?

CANDRAKĪRTI COMMENTARY

As, that is, there cannot be any vision at all which does not see (apasyan) — because there is no relation between the power of vision and an unseeing thing like a post - to say ‘vision’ is ‘what sees’ does not make sense (fn 3 The thought is: vision, distinct from an agent and an object of vision, is unintelligible; or vision is seeing.). Although the text has, for reasons of metre, ‘vision sees’, in exposition one should read it ‘how can it make sense to say “vision” “sees”’.

Further, in this way of thinking to say ‘“vision” is “what sees” ’ is to suppose a connection of an act of seeing with the sense of sight, either as endowed or not endowed with self-existent vision (darsanasyabhava).

Nagarjuna explains that neither possibility makes sense:

KALUPAHANA COMMENTARY

The essentialist definition of "seeing" as possessing the "nature of seeing" (darsana-svabhava) is tantamount to saying that "seeing always sees." This, indeed, is the statement with which the Sarvastivada (specifically Vaibhasika) began its description of perception, as indicated by the quotation referred to in the note to III.2. In other words, it is not possible to recognize any form of seeing that is "not presently perceiving" (na apasyamanam), or there cannot be a "non-seeing perception." If such be the definition, Nagarjuna raises a question regarding the appropriateness of the statements, "Seeing perceives."

GARFIELD COMMENTARY

4. When all there is to vision is visual perception, what is the motivation for positing an entity to undertake the process of perception? All there is to vision is the perceptual process: We don’t need to posit an entity - the visual faculty over and above the set of interdependent phenomena that subserve vision. The desire to do so is of a piece with the more general substantialist imperative to posit an independent substratum to support every capacity or property.
Kārikā III.5

INADA (Skt):
Verse 5 - The seeing activity does not see nor does a non-
seeing activity. Again, it must be admitted that the seeing
agent which relies upon the seeing activity has already been
explained.

JONES (Skt):
[5ab] Seeing does not see, nor does non-seeing see. [5cd] In
addition, the seer could only be explained by means of
seeing.

KALUPAHANA (Skt):
Seeing does not perceive, nor does non-perceiving perceive.
One should admit that a seer is explained by [the
analysis of] seeing itself.

MCCAGNEY (Skt):
Seeing does not see nor does nonseeing see.
And moreover, the seer has been explained above by and as
the seeing.

NISHIJIMA (Skt?):
5. The ability to look at others, can never be seen by others,
And at the same time the ability, which does not have any ability to
look at anything at all, has no ability to look at too.
The explanations in detail can be done by a person, who looks at
everything carefully,
And a person, who can look at everything well, is truly a person,
who can be actually well in approaching the object.

SPRUNG (Skt):
5 Neither vision as such nor non-vision as such is what
sees. It must be accepted that the seer is accounted
for as was vision itself.

STRENG (Skt):
5. Therefore, vision does not see, and "no-vision" does
not see. Nevertheless, it is explained that also the
"seer" is to be known only by his vision.

ENGLISH TRANSLATIONS

BOCKING (Ch):
3v5 Seeing cannot see
And non-seeing cannot see
Since we have already refuted seeing
This amounts to a refutation of a seer also.

BATCHelor (Tb):
Seeing does not see; non-seeing does not see. It should be
understood that seeing explains the seer too.

DOCTOR (Tb):
Sight does not see,
Yet nonsight does not see either.
Know that sight itself
Also explains the one that sees. [III.5]

GARFIELD (Tb):
5. Seeing itself does not see.
Nonseeing itself does not see.
Through seeing itself
The clear analysis of the seer is understood.

GARFIELD-SAMTEN (Tb):
5. Seeing does not see.
Nonseeing does not see.
Through seeing itself
The analysis of the seer is understood.

HAGEN (paraphrase):
Neither seeing nor non-seeing see. It is through the
careful examination of seeing itself that the seer is
accounted for.
PINGALA COMMENTARY

3/5 Seeing cannot see, for reasons explained in our refutation of errors. Non-seeing cannot see because it possesses no characteristic of seeing, and when there is no characteristic of seeing how can there be seeing? Where no dharma of seeing exists, no seer exists either, and why? If there were seers who existed apart from seeing, then those without eyes should also be able to see, using their other faculties. If we saw by means of seeing, then the characteristic of seeing would exist within the act of seeing. But the one who sees is not the characteristic of seeing. This is why it says in the verse. when we refute seeing, this implies a refutation of the seer. Again:

CANDRAKĪRTI COMMENTARY

5ab Neither vision as such nor non-vision as such is what sees.

It is not logically possible (nopapadyate) to add the idea ‘it sees’ to a self-existent vision which is by nature the activity of seeing; because this would imply that both the act of seeing and vision are uselessly duplicated. Nor does non-vision see because it is devoid of the activity of seeing as are things like the tip of the finger. This is the meaning.

If ‘Neither vision as such nor non-vision as such is what sees’ then, ‘. . . how can it make sense to say “vision” “sees”? In this way we see the connected thought.

Some, however, think that there are imperishable elements (dharmanatra) (fn 4 “Vision”, for example. This is a view of the Vaibhasika school of Buddhism. The elements become ‘active’ on entering into existence.) which enter into existence, but are inactive at the moment when they do so. No one sees any object if there is no activity of seeing. They think that what we are trying to prove, namely, that ‘vision does not see’ is already established.

Our answer to this is that if an activity does not exist as a factor in the transactional world (vyavaharaghabhuta) then there is no corresponding imperishable element either. Being destitute of activity, like the sky-flower, how can such a dormant, imperishable element exist? So, if, for the transactional world one should accept that, given an imperishable element, there must be activity as well so, for the way things truly are (tattvacinta), one must acknowledge that even as there is no activity there is no imperishable element either.

As Aryadeva says in the Catuhsataka: ‘Nothing eternal has activity, nor is there activity in the all-pervading; yet the non-active is like the non-existent. Wiry do you not value what is neither (nairatmya)?’

And so this stricture is not an obstacle; nor do we incur the fault of proving the obvious.

The concept of an agent of vision is unintelligible

But our opponent objects. We do not suppose that vision derives its name from being the agent of seeing (karta); rather it derives its name from being the means of seeing. So we do not incur the fault you charge us with. The one who, by vision as the means, sees something is the seer (drasta) which is either consciousness or an enduring self. Because the agent of vision truly exists, vision is proved as well.

Nagarjuna replies

5cd It must be accepted that the seer is accounted for as was vision itself.

As the inadequacy of the concept of vision was shown in the verse beginning, ‘Vision does not see itself, so the inadequacy of the concept seer should be understood in the same way. The following quotation, among others, bears on the subject: ‘The seer does not see himself by means of vision. How will something which does not see itself see other things?” (fn 5 i.e. the very notion of ‘one who sees’ yields no sense. Cf. Kārikā 2, p. f.)

Thus the agent, like vision itself, has been proved not to exist.

Our opponent objects. The seer does exist because the object of seeing (karma) and the means of seeing (karana) exist intact. That is, there can be neither object nor means of something, for example the son of a barren woman, which does not exist. But the means exist, namely, the act of vision and the object as well, namely, the thing seen. Therefore an agent whose means and whose object factually exist does himself exist, like one who splits wood.

We reply. There is no object of vision (drastavya) and no act of vision (darsana); so how could there be an agent of vision (drasta)? Object and act require an agent. On being investigated, however,
KALUPAHANA COMMENTARY

After explaining the difficulties involved in the statement, "Seeing perceives," here Nagarjuna insists that it is not possible to assert that "non-seeing perceives." Just as much as a substantial event like "seeing" cannot be appropriately explained, even so a substantial entity like a "seer" (drastr) also cannot be established. The rejection of the latter follows from the refutation of the former. This point is further elaborated in the following verse.

GARFIELD COMMENTARY

5. Perception is not accomplished by any independent entity known as vision. But that doesn’t mean that things that are incapable of sight thereby perceive. In order to know what the proper subject of vision is, it is important to undertake a careful analysis of the perceptual process and not simply to posit a faculty with the nature of vision.
Kārikā III.6

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 6 - The seeing agent does not exist whether it is with or without the seeing activity. Since it does not exist, where can the seeing activity and the object to be seen be?

JONES (Skt):
[6] There is no seer apart from seeing, nor not apart from seeing - when there is no seer, how can there be “seeing” or “the seen”?

KALUPAHANA (Skt):
A seer does not exist either separated or not separated from seeing. When a seer does not exist, whence can there be seeing and the object of seeing?

MCCAGNEY (Skt):
The seer does not exist separated or not separated from seeing.
If the seer does not exist, where is the seeing and the seen?

NISHIJIMA (Skt?):
6. A person, who looks at everything well, is not always a person, who does not criticize anything others at all.
It is sometimes true that an attitude to despise others’ products severely, suggests also some kinds of sincere attitude to the products.
What has been seen, is just what we have seen actually, and furthermore,
If there were no person, who esteems the product, where can those products actually exist.

SPRUNG (Skt):
6 No agent of seeing exists either detached from or not detached from the act of seeing. How can there be seeing and an object of seeing if the seer does not exist?

STRENG (Skt):
6. There is no "seer" with vision or without vision;
Therefore, if there is no "seer," how can there be vision and the object seen?

ROBINSON (Skt):
The seer does not exist either apart from or non-apart from the seeing; when the seer does not exist, where are the seen and the seeing?
3/6 When there is seeing, then no seer can be established, and also when there is no seeing no seer can be established. Since there is no seer, how can there be seeing, or anything seen? And if there is no seer, who is there to employ a dharma of seeing to distinguish external forms? For these reasons it says in the verse: Since there is no-one who sees, how can there be seeing, or filing seen? Again,

CANDRAKĪRTI COMMENTARY

6ab No agent of seeing exists either detached from or not detached from the act of seeing.

This means that if an agent of seeing existed, he would either be dependent (apeksa) on the act of seeing, or not. If he is considered to be dependent then he is not detached from the act of seeing. The seer will be dependent on seeing either as having seen or as not having seen. If the seer has seen, he is not dependent on seeing; how can a seer who has already seen still be dependent on seeing? For what has been accomplished need not be accomplished (siddha) again. Then there is the seer who has not seen (asiddha) but who is dependent on, i.e. related to, seeing. Because he has not seen he cannot be dependent on seeing any more than the son of a barren woman can be. Thus, in so far as he is not detached from seeing, the seer cannot exist in dependence on it; that he cannot exist detached either because then he does not require seeing was explained earlier. Thus, as the seer, whether separate or not separate from seeing, does not exist, so:

6cd How can there be seeing and an object of seeing if the seer does not exist?

If the seer does not exist, an object and an act of seeing, thus lacking any basis, will not be possible; how then will the seer be established by their existence?

Consciousness cannot be urged as proof of vision and its object

You may object that the act of seeing and its object do exist because their consequences exist as fact. That is,

KALUPAHANA COMMENTARY

The metaphysical views discussed previously lead to two different conceptions of a "seer" (drastr), namely, (i) a seer associated with seeing (a seeing seer), which is based on a theory of identity, and (ii) a seer dissociated from seeing (a non-seeing seer), which emphasizes difference. Having denied both, Nagarjuna raises the question: "In the absence of a seer, whence can there be seeing and the object of seeing?" This question is raised not by a dogmatic philosopher, but by a critical epistemology. It is simply asking the question, "Just because you have come up with an unacceptable definition of a 'seer', are we going to ignore the fact that there is seeing and also the objects of such seeing? If there were to be no seer, how can you account for the perception of objects?" In other words, Nagarjuna, in the way he formulates his question, is asserting that seeing and the objects of seeing are mutually dependent upon a seer. This assertion leads Nagarjuna directly to the statement of the Buddha in the early discourses.

GARFIELD COMMENTARY

6. On Nāgārjuna’s analysis, we can’t make sense of an autonomous subject of visual perception. For such a subject would by definition have its identity as a visual subject independent of perception. But there is no sense in calling something that does not see a seer. On the other hand, if we pack vision into its definition, we thereby fail to identify the subject nonrelationally. Vision and its subject are thus relational, dependent phenomena and not substantial or independent entities. So neither seeing nor seer nor the seen (conceived of as the object of sense perception) can be posited as entities with inherent existence. The point is just that sense perception cannot be understood as an autonomous phenomenon, but only as a dependent process.
Kārikā III.7

[This kārikā has no correlate in the Chinese translation and some Sanskrit & Tibetan editions.]

praṭītya mātāpitaraḥ yathoktaḥ putrasaṃbhavaḥ
ca kṣuṇāpe praṭītyai vam ukto vijnānasamābhavaḥ ||7||

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 7 - As it is said that a child is born out of the father and mother relationship, so also does consciousness arise from the bond between the eye and its material form.

JONES (Skt):
[7] Just as the birth of a son is said to be dependent upon the mother and the father, so too the arising of visual consciousness is said to be dependent upon the eye and the material form.

KALUPAHANA (Skt):
Just as the birth of a son is said to be dependent upon the mother and the father, even so, the arising of [visual] consciousness is said to be dependent upon eye and material form.

MCCAGNEY (Skt):
As the birth of a son is said to be dependent upon a mother and father, so the arising of consciousness is dependent upon eye and form (material objects seen).

NISHIJIMA (Skt?): -

SPRUNG (Skt):
7 The birth of a son is held to depend on the mother and father; similarly the genesis of consciousness is held to depend on the faculty of sight and its object.

GARFIELD-SAMTEN (Tb):
[Tsong-kha-pa: “it [this verse] is not consistent with Avalokitavata’s statement that Mulamadhyamakakarika contains 449 verses. Therefore, it appears that it was translated from a corrupted version.”]

HAGEN (paraphrase):
As the birth of a child is said to depend upon a mother and a father, so it is said eye consciousness depends on an eye and material form.
CANDRAKĪRTI COMMENTARY

Consciousness comes into existence dependent on the act of seeing and its object. From the conjunction of these three there is contact with things which results in afflicted existence (śasrava) (fn 4). The three āsravas (fn 6) are desire, belief that being is particular, and ignorance.) and simultaneously there is feeling. Dependent on feeling there is craving for existence. These four factors of existence (fn 7) are caused by the act of seeing and its object. Therefore, as their effects are real, seeing and its object must be real.

We reply that these two could be real if the four factors - consciousness and the others - were real. That is,

KALUPAHANA COMMENTARY

Being a competent and insightful philosopher, Nagarjuna immediately perceives the difference between the Buddha's analysis and those of his "substantialist" protagonists. Abandoning the misleading terminology of the substantialist, Nagarjuna adopts the Buddha's own terminology to explain the process of perception: "Depending upon the eye and visible form arises visual consciousness," (Cakkhu ca paticca rupe ca uppajjati cakkhu-vinnanam) (M 1.11).

Even though the three terms used here correspond to the terms used by the substantialists cakkhu stands for darsana, rupa for drastavya, and drastr for vijnanathe description itself is different. Here the explanation of visual perception does not begin with the assertion of the cogito in order to end with the perception of the external object, which was one of Nagarjuna's criticism of the substantialist view. Neither is perception defined in a more substantialist way as in the quotation from the Sarvastivadins which says: "The substance called the eye is of the nature of that which sees," (see note III.2). No metaphysical jargon is introduced here at all. Without getting involved in the substantialist terminology and concepts, the present statement of perception is based entirely on the principle of dependence (pratityasamutpada). Thus, visual consciousness is said to be dependent upon the eye (= faculty) and visible form (= object). Such an explanation immediately eliminates the conception of a substance (svabhava, atman) and replaces it with a principle of "dependence" (pratityasamutpada). In order to illustrate this process of perception, Nagarjuna utilizes the example of the birth of a son depending upon the mother and father.

It would, therefore, be unfair to think that an illustrious Buddhist philosopher like Nagarjuna failed to see the important philosophical differences between the Buddha's explanation of the causality of perception and that presented by the metaphysicians. This verse, therefore, embodies another of the more appropriate views (kalpana yatra jojyate, see XVII. 13) that Nagarjuna has been elsewhere attributing to the Buddhas, the Sravakas, and the Pratyeka-buddhas.

GARFIELD COMMENTARY

7. (fn 41. The authenticity of this verse is a matter of dispute. It is not present in all editions of the text and may be a later interpolation.)

Here the opponent offers yet another argument in favor of the inherent existence of the visual faculty (and, by extension, the other sense faculties): Consciousness is a consequence of vision, and it surely exists - in fact, its existence, one might say, is self validating. Given the reality of the effect, the cause must also be real. (fn 42. And from the standpoint of a Buddhist analysis of human existence there is more to it than this: In many presentations of the "twelve links of dependent origination," consciousness conditions craving for existence, which gives rise to existence in saṃsāra.) The final two verses reply to this objection and state the obvious generalization to all other senses, sense objects, sense faculties, and faculties of knowledge. The reply consists in pointing out that the other faculties and aggregates, including introspection and consciousness, exist and fail to exist in exactly the senses that vision and its objects exist and fail to exist: All are empty of inherent independent existence. But all exist conventionally. So the effect that, according to this interlocutor, exists inherently and demands an inherently existent cause does not so exist. And in the sense that it exists, its causes also exist:

Kārikā III.8

Drṣṭavyadṛśanābhāvadvi jñānādiḥtuṣṭayam

Nāṣṭīty upādānādīni bhaviṣyanti punaḥ: katham ||8||

INADA (Skt):
Verse 8 - From the non-existence of the seeing activity and the object to be seen, it follows that the four-fold consciousness, etc. (i.e., touch, sensation, desire) do not exist. How then, again, could it be possible for clinging action, etc., to arise?

JONES (Skt):
[8] Because of the nonexistence of the seeable and the seeing, the four psychological factors constituting a person - feeling, forming ideas, dispositions, and consciousness - do not exist. How then can the remaining steps in “dependent-arising” (see Chapter 26) arise?

KALUPAHANA (Skt):
If it is the view that the four factors, beginning with consciousness, do not exist, because of the absence of seeing and the object of seeing, how then can there be grasping?

MCCAGNEY (Skt):
From the non-existence of seeing and the object seen, consciousness and the other four [form, sensation, perception, and disposition] do not exist. How will there be grasping [sensation, liking, desiring], etc.?

NISHIJIMA (Skt?):
7. Leaving from the wrong idea that What has been seen, and What we have seen, do not exist really, The Four, that is, consideration, perception, action at the present moment, and Reality itself, are this World.
If we insist that it is perfectly impossible for perception, consideration, Action at the present moment, and Reality, not to exist, What kind of Real Existence can really exist even in future at all?

SPRUNG (Skt):
8 Because the act of seeing and its object do not exist, the four factors — consciousness and the others — do not exist. How will the entire series — grasping and so on — exist?

STRENG (Skt):
8. Since the "object seen" and the vision do not exist (independently, on their own), there is no four-fold consequence: knowledge, etc. cognitive sensation, affective sensation, and "desire". Also, then, how will the acquisition (upadana) of karma and its consequences i.e., existence, birth, aging, and death be produced?

ROBINSON (Skt):
You should know that hearing, smelling, tasting, touching, and thought, the hearer and the heard, etc. have been explained merely by the explanation of seeing.

BOCKING (Ch):
3v7 Since seeing and what can be seen do not exist, the four dharmas of consciousness etc., do not exist. Nor the four types of attachment, nor causal links. How could these things exist?

BATCHelor (Tb):
Because there is no what-is-seen and no seeing, the four such as consciousness do not exist. How can clinging etc. exist?

DOCTOR (Tb):
As there is nothing to see and no sight, The four, such as consciousness, do not exist. How could appropriation and other Such factors come into existence? [III.7]

GARFIELD (Tb):
8. From the nonexistence of seeing and the seen it follows that The other four faculties of knowledge do not exist. And all the aggregates, etc., are the same way.

GARFIELD-SAMTEN (Tb):
7. From the nonexistence of seeing and the seen it follows that The four—consciousness, etc.—do not exist. Since this is the case, how could such things as The appropriator exist?
HAGEN (paraphrase):
If seeing and the object seen cannot be discerned, it follows that distinction, touch, sensation, and desire cannot be discerned. How, then, can there be grasping?

GOLDFIELD (Tb):
Know that these reasonings refuting the faculty that sees Refute the faculties that hear, smell, taste, touch, and the mental faculty as well, Refute the hearer and the other perceiving consciousnesses, Refute sound and the other perceived objects. (8)

PINGALA COMMENTARY
3/7 Since the dharmas of seeing and what is seen do not exist, none of the four dharmas of consciousness, contact, reception and craving exists, and since there is no craving etc., the four graspings etc., and each one of the twelve causal links similarly does not exist. Again:

CANDRAKĪRTI COMMENTARY
8abc Because the act of seeing and its object do not exist, the four factors - consciousness and the others - do not exist.

The thought is that as the agent of seeing does not exist neither do seeing and its object, as has been explained. How then can the four factors consciousness, contact, feeling and craving existence - be real? It follows that they are not real (na santi).

You may argue that they do exist because their effects are fact. One says ‘Because of craving for existence there is appropriation of things.’ From the existence of the four factors the entire series (fn 8 This is the twelvefold ‘causal’ account of afflicted existence or samsāra accepted by all Buddhists.) — grasping, existence, birth, old age and death — arises. Consciousness and the other factors exist therefore because their effects are fact.

We reply. If the four factors — consciousness and the others — existed, then the entire series — grasping and so on — would exist too. As, however, because vision and its object do not exist, the four factors consciousness and the others — cannot exist either, so,

8d How will the entire series - grasping and so on - exist?

The meaning is that the entire series grasping and so on does not exist.

The analysis applies to the other sense faculties

Finally, in order to apply this exposition of the faculty of vision to the remaining sense faculties, Nagarjuna says

KALUPAHANA COMMENTARY
Candrakīrti's negativist approach creates a problem in regard to the interpretation of this verse. The use of the iti-formula needs to be carefully handled if we are to avoid a gross misinterpretation of Nagarjuna's thoughts at this point. Nagarjuna has already refuted the metaphysical views pertaining to seeing and seer. However, at III.6, he was asserting that one cannot speak of seeing and the seen without a seer. It is possible that someone may insist: "If there were to be no seeing (darsana, caksu) and the seen (drastavya, rupa), then the four factors [namely, feeling (vedana), perception (samjna), dispositions (samskarah) and consciousness (vijnanam), which constitute the psychic part of the psychophysical personality and hence the equivalent of drastr] are also nonexistent (nasti)." The iti-formula converts this to a view or a statement someone could express. If so, Nagarjuna's counter-question would be: "How then can there be grasping?" Surprisingly, Candrakīrti interprets Nagarjuna's question as implying a denial of grasping (na santy upadanadinity arthah).

However, if the statement preceding iti is understood as the view of the opponent, then Nagarjuna's answer is: "How can you explain grasping?" In other words, Nagarjuna seems to be saying: "Grasping exists, for that is what is eliminated at the moment of enlightenment and freedom (anupada-vimukti). Grasping is dependent upon consciousness (vijnana) which is, in turn, dependent upon the eye and visible form. Any other explanation of perception is unacceptable to me."

Such an explanation is in perfect conformity with the contents of the two preceding verses both of which represent positive statements of Nagarjuna.

GARFIELD COMMENTARY
8. (“And all the aggregates,” fn 43. The skandhas (literally “heaps” or “piles,” but most often translated as “aggregates”) are the basic constituents of the personality. Five are typically identified: form (really matter - the physical body), sensation, perception, disposition (behavioral and cognitive), and consciousness. But the term “skandha” indicates two features of this decomposition that must be born in mind to avoid confusion: The division is practical and empirical, and not philosophically principled, and the skandhas themselves are decomposable into further heaps, etc. These are not, hence, ontological fundamentals, but rather the first level of a psychology.)
Kārikā III.9

vyākhyātāṁ śravaṇaṁ ghrāṇaṁ rasanaṁ sparśanaṁ manaḥ |
darśanenaiva jānīyāc chroṣṭrotyāvākādi ca ||9||

ér bí shē shēn yì shēng jí wén zhē dēng
dāng zì rú shì yì jiē tóng tóng yú yú wū shāng shuí

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 9 - Based on the discussion of the seeing activity, it is to be known that the functions of hearing, smelling, tasting, touching, thinking or the hearer and what is to be heard, etc., could be explained (in the same manner).

JONES (Skt):
[9] This analysis should be applied to the other senses, the agents who sense, and their domains.

KALUPAHANA (Skt):
What has been explained as hearing, smelling, tasting, touching, and mind, as well as the hearer, the sound, etc. should be known in the same way as seeing.

MCCAGNEY (Skt):
What has been explained for seeing [applies equally to] hearing, smelling, tasting, touching, and thinking as well as the origin of the hearer and the sound, etc.

NISHIJIMA (Skt?):
8. The explanations of function to hear, function to smell, Function to taste, function to touch, and function of the central sense perception, Can be explained relying upon the function to see as a matrix, Therefore it is possible for us to utilize it for to hear and what is heard, and other kinds of sense functions too.

SPRUNG (Skt):
9 It should be realized that by this analysis of vision, the agents and objects of hearing, smell, taste, touch and thought have been analysed as well.

STRENG (Skt):
9. Likewise hearing, smelling, tasting, touching and thought are explained as vision. Indeed one should not apprehend the "hearer," "what is heard," etc. as self-existent entities.
PINGALA COMMENTARY

3/8 Just as the dharmas of seeing and what is seen are empty because they are wholly dependent upon conditions and not fixed, so the five remaining faculties of ears etc. and five objects such as sound etc. must be understood in the same way as seeing, what is seen, and so on. Because these may be interpreted according to the same principle they are not discussed separately.

CANDRAKĪRTI COMMENTARY

As the illustrious one has said, 'The eye does not see material objects nor does the mind know ideas; but that is the surpassing truth where the ordinary person does not penetrate. When the teacher, who is aware of the surpassing truth, explains vision in terms of causes he is speaking in a modified way to serve a purpose.'

And again, it is commonly supposed that visual consciousness arises in dependence on the organ of sight and the object; but the object is not based in the organ nor does the organ enter into the object. The putative elements are ill and without substance, but are thought to have substance and to be good; visual consciousness has the same origin: it is a misconception, a non-existent figment. The wise one discerns, in meditation, how the contents of consciousness arise and vanish, are born and destroyed; he understands that consciousness neither comes nor goes, that it is a magician’s trick, and devoid of being.‘

And from the Upaliprcccha: ‘The eye sees in conjunction with all the enabling conditions, it does not see in default of these. The eye does not see an object because conjunction and disjunction are just ways of thinking. The eye sees differentiated, coloured, pleasant objects in conjunction with light; because the eye depends upon this conjunction the eye never sees. Again, when a pleasing sound is heard it never enters into the mind; one cannot perceive its passage; it is by a theory that we explain the origin of sound.’

KALUPAHANA COMMENTARY

Thus, after pointing out the inappropriateness of certain metaphysical views per-mining to visual perception and having stated the Buddha's own explanation of perception in terms of "dependent arising" (pratityasamutpada), Nagarjuna concludes that the other five faculties and their objects should be understood in the same way as "seeing." This indeed is a very positive explanation of sensory experience and a faithful representation of the Buddha's teaching as embodied in the "discourses."

GARFIELD COMMENTARY

9. Again, the point of this chapter is emphatically not that there is no perception, or that there are no sense faculties, sense organs, or sense objects. Rather the point is that none of these can be analyzed successfully as autonomous entities. They are interdependent phenomena that depend for their existence and their character on each other. None of them exists independently. They are all, hence, empty of inherent existence, and carving the process of perception into these components represents a conventional taxonomy of a process that does not present itself with natural joints demanding cleavage on their own.
Chapter IV

स्कन्धपरीक्षा चतुर्थ प्रकरणम्

中論觀五陰品第四(九偈)

skandhaparīkṣā nāma caturtham prakaraṇam

Chapter IV: Examination of the Aggregates
Chapter IV
MAJBA (TOPICAL OUTLINE)

OUTLINE:

We are still in the section of the text explaining that the three kinds of phenomena are selfless. We have completed the first part—the refutation of the phenomenal self of the faculties—and we now turn to the second part—the refutation of the phenomenal self of the aggregates [128:2].

EXPLANATION:

In response to this previous analysis one might say, “Even though the sense faculties have been refuted, since the five aggregates have not been refuted, it follows that they exist. If they exist, since the sense faculties are included among them, it follows that they exist essentially.”

The refutation of this argument has three parts: refutation of the essential existence of the form aggregate, applying this argument to the other aggregates, the mode of reply to the arguments advanced by others.

SUMMARY:

As the causes and effects of the aggregates have been explained, one should establish by reasoning that cause and effect make no sense at all if they exist as they are grasped—as existing inherently, without being merely nominally imputed. Thereafter, one should train one’s mind in reasoning which shows, through dependent origination, by the mutual reinforcement of the ascertaining of their aspects of emptiness and of appearance, that only in the context of nominal imputation do the elements and that which is arisen from elements—such things as contact and feeling—make sense.
CHAPTER IV - Examination of the Skandhas

With the same motive in mind as in previous chapters, i.e., to establish the impossibility of imputing either an enduring entity or characteristic, this chapter takes up the subject of the five skandhas (rupa, vedana, samjna, samskara and vijnana). Again, as it was done in Chapter III, Nagarjuna treats only the first of the five skandhas, i.e., rupa, and assumes that the same line of argument can be cogently carried out with respect to the other four. He first states that it is inconceivable to say that rupa can be separated from the Four Great Elements (Earth, Water, Fire, Wind) for these are after all concomitant causes for the rupa's own being. On the other hand, the Four Great Elements cannot be thought of in the absence of rupa. But all this does not mean that neither rupa nor the elements cease to exist. Nagarjuna is only trying to exhibit the fact that any concept or thing cannot be described by reference to a simple cause-effect relationship in order to establish its existential status.

KALUPAHANA (CHAPTER OVERVIEWS)

4. Aggregates (skandha). Of the five aggregates into which the human personality came to be analysed in the Buddhist tradition, Nagarjuna takes up only the first, namely, material form (rupa). After explaining Nagarjuna's treatment of material form, Inada rightly remarks: “But all this does not mean that neither rupa nor the elements cease to exist.”72 This confirms what we have said about Nagarjuna's treatment of other concepts such as cause, effect, motion, or seeing. However, Inada's explanation of the reason for this needs to be qualified. He maintains: “Nagarjuna is only trying to exhibit the fact that any conception or thing cannot be described by reference to a simple cause-effect relationship in order to establish its existential status.” On the contrary, it seems that Nagarjuna may not have any difficulty in maintaining that there is a simple cause-effect relationship between the four primary elements (manbhuta) and material form (rupa), so long as that cause-effect relationship is understood as one of dependence, which was the Buddha's own view.73 Yet, what is being introduced here is not such a simple theory of dependence of the effect upon the cause.

The conception of karana that Nagarjuna refers to here is one of the six causes (hetu) referred to in the Sanskrit Abhidharma texts and interpreted by the Sarvastivadins as a “unique cause,” that is, “anything other than itself” (svato 'nye karanahetuh).74 In other words, it is any cause whose serf-nature is different from that of the effect. The four great elements (mahabhuta) depending upon which the material form (rupa) comes to be would be the karana of material form. Yet as a karana of material form it would be distinct from material form. It is this particular definition of karana that is criticized by Nagarjuna. His reason for denying it is stated in IV.2: “If material form is separated from the unique cause of material form [i.e. the four great elements], it would imply that material form is without a cause (ahetuka).” However, Nagarjuna's empiricist and analytical approach does not allow him to recognize an effect (artha) which is without a cause (ahetuka). Existence (bhava), which Nagarjuna was often criticizing implied self-existence (svabhava). The fact that the Sarvastivadins defined not only material form, but also the other four aggregates feeling, perception, disposition, and consciousness as self-existent entities (bhava) is evident from Nagarjuna's statement at IV.7. Thus, Nagarjuna's basic criticism of the Sarvastivadins in this chapter is that they could not consistently speak of a unique cause (karana), while at the same time recognizing a cause and an effect that are related by way of self-nature (svabhava). In other words, the notion of self-causation (svatotpatti) contradicts a “unique cause” (karana), for it is anything other than itself.
Batchelor (Poetic “Translation”)

Body

I have no body apart
From parts which form it;
I know no parts
Apart from a “body.”

A body with no parts
Would be unformed,
A part of my body apart from my body
Would be absurd.

Were the body here or not,
It would need no parts.
Partless bodies are pointless.
Do not get stuck in the “body.”

Jones (Commentary)

4. The Aggregates of the Body

Notice that the Buddhist term for matter - “rupa” - means “form.” It is a matter of what we experience things, rather than any “material object” existing independently of us. More generally, the Buddhist ontology is a matter of our experiences of the world, not the world independent of how we experience it. Its fundamental ontology is in terms of the factors of experiences - dharmas - not material particles or fields. Nagarjuna’s emptiness is applied to this ontology.

The argument in verses 1-6 connects the concepts of “cause” and “effect.”Something is a cause only in relation to an effect, and so if there is no cause, there is no effect, and vice versa. If something already exists, then it does not need a cause; and if something’s effect does not exist, then we cannot speak of it being a “cause” (v. 4). Cause and effect are not the same, but the concepts are interconnected, and so we must identify them together (v. 6).

In verse 8, Nagarjuna affirms the impossibility of a refutation of emptiness by anything: the alleged refutation cannot involve self-existence because self-existence does not exist; and any refutation involving emptiness only confirms emptiness. That is, the refutation will be of the same nature of what is allegedly being refuted - emptiness - and so will not be a refutation at all. Nagarjuna here also refers to emptiness as a means (upaya). This might suggest that emptiness is substantive, since it is used to refute an argument rather than simply being the conclusion reached when self-existence is refuted, But it could be an instance of the “skillful means (upaya)” by which bodhisattvas use what is not in the final analysis real or true to help others. (See Jones 2004: 198-200.)

Gyamtsa (Commentary)

4

An Examination of the Aggregates

The five aggregates (skandhas) are everything included in matter and mind. To describe them briefly, the aggregate of forms comprises all material phenomena. In sentient beings, this refers to each individual’s body; it also generally includes all matter, all objects of sense perception that exist in the outside environment.

The aggregate of feelings is defined as our experiences of sensations that we find pleasant, unpleasant, or neutral.

The aggregate of discriminations is defined as “clinging to characteristics” and refers to all of our thoughts that things are either clean or dirty, hot or cold, good or bad, and so forth.

The aggregate of formations includes all the other thoughts and emotions that individuals experience. Some of them are positive, like faith, nonviolence, and joyous diligence; some are negative, like anger, jealousy, and arrogance; some could be either positive or negative, like regret or analysis. This aggregate also includes the entities that are the phases of the existence of what is material and
mental, like arising, abiding, cessation, and so forth—the stages that matter and mind pass through.

Finally, the aggregate of consciousnesses refers to the six primary consciousnesses that perceive the essence of their respective objects: the eye, ear, nose, tongue, and body sense consciousnesses, and the mental consciousness.

In the Heart of Wisdom Sutra, Shariputra asked Avalokiteshvara, “How should noble men and women who wish to engage in the profound practice of transcendent wisdom train?” By the power of the Buddha’s blessing, Avalokiteshvara was able to respond in the following way:

Shariputra, noble men and women who wish to engage in the profound practice of transcendent wisdom should see this clearly: They should see clearly that the five aggregates are empty by nature.

In another passage in the Prajnaparamita Sutras, the Buddha taught:

Form is empty of form.

In this chapter, Nagarjuna proves the validity of these statements with logical reasoning.

Nagarjuna composed this chapter in answer to those who claimed that the aggregates truly exist because the Buddha explained them in his Abhidharma teachings (fn The Abhidharmakosā is a set of the Buddha’s teachings from the first turning of the wheel of Dharma in which he described the characteristics of, among other things, the sources of consciousness, aggregates, and elements. In these teachings, the Buddha did not explicitly refute the true existence of the phenomena that he described. He did explicitly refute their true existence, however, in the teachings of the second turning of the wheel.). The Buddha described them and therefore they must exist. It then must be the case, they argued, that the twelve sources of consciousness, the subjects of Nagarjuna’s refutations in the last chapter, also exist, because the twelve sources of consciousness are included within the five aggregates. Therefore, the five aggregates exist, the twelve sources of consciousness exist, and things are not empty after all—they are real. To help these people understand that this is not the case, that things are actually empty of true existence, Nagarjuna had to demonstrate that the five aggregates do not truly exist. This is his focus in this fourth chapter.

The problem with the way that those who assert that things exist thought about things was that they thought that if you say things exist—if you use the word existence—it necessarily implies true existence. According to the proponents of the Middle Way, however, things in conventional reality exist as dependency arisen mere appearances. Therefore, to say that conventional appearances exist does not imply that they are real—they are simply mere appearances that occur due to the coming together of causes and conditions, like dreams, illusions, movies, and water-moons.

Out of the five aggregates, Nagarjuna analyzes the aggregate of forms because, since it is the coarsest of the five aggregates, it is the easiest to examine. The way he does so is to break down the aggregate of forms into its causal and resultant constituents. Thus there are causal forms, which consist of the four great elements of earth, water, fire, and wind, and resultant forms, consisting of the five sense faculties and the five objects they perceive—the results that arise from different combinations of the causal forms. Nagarjuna breaks forms down into these two categories and then looks at how these two could possibly exist in relation to each other.

In the preceding chapter Nagarjuna broke down the sources of consciousness into perceived objects and perceiving subjects. Here, he looks at the aggregates in terms of causes and results, and so we can see that there are many different ways one can analyze things.

The root verse that sets out the position of this chapter is the first one:

Except for there being the cause of form, Form would not be seen.
Except for there being what we call “form,” The cause of form would not appear either.

If the aggregate of forms truly existed, then the causal forms—the four great elements, and what results from those four elements—the five sense faculties and their five objects, would have to exist in relation to each other in one of the following ways: The cause would have to exist before the result, the result would have to exist before the cause, or cause and result would have to exist simultaneously. We need to examine each of these possibilities to see if any one of them is viable. If in fact none of them is logically possible, then we can conclude that forms do not really exist at all.

The first possibility is impossible, because a cause cannot exist before its result. If it did, why would it be a cause? Something is a cause only if it produces a result, but if no result exists, then there is no reason to call anything a cause—nothing has performed the function of a cause, and therefore no cause exists. Thus, the cause cannot exist before the result. Nor can the result exist before the cause, because if it did it would be a result that was not produced by anything. It would be a result that had no cause. Finally, cause and result cannot come into existence at the same time, they cannot exist simultaneously, because two things that come into existence at the same time do not have a chance to be cause and result—one does not have the opportunity to produce the other. Things cannot have a cause-and-result relationship if they occur simultaneously. Since when we analyze we find that they cannot occur sequentially and they cannot occur simultaneously, we can definitively conclude that causal and resultant forms do not truly exist. The
appearances of them are just like the appearances we perceive in our dreams.

Just as we have analyzed forms in this way and have determined that they do not truly exist, that they are mere appearances of things that are not really there, like dreams and illusions, so we can analyze everything else that is included in the four remaining aggregates, as Nagarjuna explains in verse seven:

Feelings, discriminations, formations,
Minds, and all the things there are
Are susceptible to the same stages of analysis
That forms have been put through here.

What this verse tells us to do is to analyze feelings, discriminations, formations, and consciousnesses in the same way that we analyzed forms. In the same way as we showed that causal and resultant forms cannot truly exist, because it is logically impossible for them to exist either sequentially or simultaneously and there is no third alternative, so we should examine everything else and see that whatever causes there are, whatever results there are, they cannot truly exist either. We can analyze all different kinds of opposites in this way as well. For example, what comes first, darkness or light? Clean or dirty? Happiness or suffering? Which one of these really comes first?

Based on this analysis, we can gain certainty that dependently existent phenomena do not truly exist because they cannot exist one before the other, they cannot exist simultaneously, and there is no other possibility. Nevertheless, there are still appearances of them, mere dependently arisen appearances, like appearances in dreams. Since there certainly are these appearances, we have no reason to think that reality is complete nothingness. We have no reason to be afraid. We should not be afraid of emptiness, because emptiness does not mean complete nothingness. The true nature of reality is appearance-emptiness inseparable.

In this same chapter, Nagarjuna also describes the experience of debating the teachings on emptiness. What is it like when someone tries to challenge the Middle Way explanations of emptiness in a debate? The eighth verse reads:

When emptiness comes up for debate,
Whatever answers try to prove true existence,
Those answers are unsound
Because they are equivalent to the very thesis to be proved.

What happens first is that the ones who follow the Middle Way, who have understood the true nature of reality, encounter people who believe that things truly exist. When this happens, it is necessary for the followers of the Middle Way to explain emptiness to these people who think that things are real. It is also necessary to debate with them. Debate is a good way to bring out the doubts and wrong views held by people who think that things are real.

In the debate, first the people who believe that things really exist try to prove that their position is accurate, and then the proponents of the Middle Way demonstrate that the reasons these people think things really exist are not valid after all. Then the people who believe that things are real come back with answers for why they still believe that. Whatever example they try to give for things being real, however, it is not an example of things being real at all—it is in fact an example of emptiness. Whatever answer they try to give, it is not a valid answer because it is just as empty as what they are trying to prove. Whatever they say, therefore, actually does not prove their point; it proves the Middle Way’s point. The reason for this is that they cannot find an example of anything that truly exists. That is the problem they have.

For example, the people who want to say that things truly exist will point to lots of things that seem real, like rocks, diamonds, and mountains. For the proponents of the Middle Way, however, rocks, diamonds, and mountains just prove their own point because they are just as empty as everything else. They can be analyzed with the same reasonings we have used in this chapter that examines forms, and in this way they can be demonstrated to be as empty as anything else.

The people who want to prove that things truly exist have the problem that all phenomena are equally in need of proof of their existence. So whatever these people use as their proof of existence, it is just as in need of proof as the object whose existence they are using it to establish! For example, if someone says, “This table exists because I see it with my eyes,” then what proves the existence of the eyes? They cannot say, “My eyes exist because they see the table,” because the table’s existence is what they were trying to prove in the first place. So they just end up in a circular loop. Furthermore, the experience of seeing a table occurs in a dream, too, and just as the appearance of it in the dream does not prove that it is real, so the appearance of it during the daytime cannot establish its true existence.

In the ninth verse, Nagarjuna shows how it is that those who say that things truly exist cannot find any flaws in the explanations of emptiness:

When explanations are given about emptiness,
Whoever would try to find faults in them
Will not be able to find any faults at all,
Because the faults are equivalent to the very thesis to be proved.

Here, we are looking at the time when emptiness is being taught. After the teaching is given, someone might criticize the view of emptiness, saying, “If things are empty, then that means that there are no past and future lives. There is no
such things as cause and result. There are no mental afflictions or enemies, and there is no suffering in samsara or liberation in nirvana. Even the three rare and supreme ones, the three precious jewels, do not exist.” (In The three rare and supreme ones or the three precious jewels refer to the Buddha, Dharma, and Sangha—the three objects of refuge in the Buddhist tradition. One goes for refuge from the suffering of samsara to the Buddha, the teacher; the Dharma, the teachings to be put into practice; and the Sangha, the community of noble practitioners who have directly realized the true nature of reality and who serve as one’s guides along the path.)

The proponents of the Middle Way would respond to each of these criticisms by saying, “You are right! All the things you name—past and future lives, cause and result, mental afflictions, enemies, suffering, samsara, nirvana, and the three rare and supreme ones—do not truly exist because they are empty of their own essence.” Thus, whatever someone claims is a fault in the Middle Way view is in fact empty of its own essence, and so it is precisely equivalent to the thesis that the Middle Way teachings have been proving all along. Since all faults are themselves of the nature of emptiness, it is impossible to find any valid criticisms of the Middle Way teachings on emptiness.

It is important to note here that while all things are empty of true existence, they do still appear, and no one would deny this. Therefore, appearances are described as being mere appearances: While empty they appear, and while appearing they are empty, like dreams, illusions, and water-moons.

This has been a brief explanation of the essential meaning of the fourth chapter of this text. When you read and reflect upon these explanations of the chapters of The Fundamental Wisdom of the Middle Way, you will know whether you are gaining certainty in emptiness or becoming more afraid of emptiness. It will be clear to you. Fearlessness of emptiness is a quality that one gains on the third of the four levels of the path of junction, the level of patience (In According to the Mahayana, there are five paths that constitute the journey to and attainment of enlightenment: the paths of accumulation, junction, seeing, meditation, and no-more-learning. The first two are the paths of ordinary individuals, the next two are traversed by noble bodhisattvas who have directly realized the true nature of reality, and the fifth is the path of the buddhas themselves.

The path of accumulation has three stages and the path of junction four, and although they are both the paths of ordinary individuals, the difference between practitioners at the different stages of these paths is great. For example, achieving only the second level of the path of accumulation brings one certain types of clairvoyance and miraculous powers. The point here is that the attainment of the level of patience on the path of junction is a most wonderful feat indeed.). When one gets to that point, one becomes truly unafraid of emptiness. Before that, however, we still have fear of emptiness, so we need to be on the lookout for that.

The reason that people who believe in the existence of things get frightened of emptiness is that they think the word emptiness means that there is absolutely nothing at all, that there is a complete vacuum, and this is frightening. In order to counteract that fear, it is immediately taught that there are the mere appearances of things—that emptiness does not mean a wipeout of everything we perceive and experience. Emptiness refers, rather, to the inexpressible, inconceivable reality that is the essence of all our perceptions and experiences. We can meditate on emptiness and try to cultivate this understanding of it, but if our meditation does not have a lot of power to it, the reason is that we do not have certainty in emptiness yet. And as long as we still have lots of doubts, our meditation on emptiness will not be very helpful.

As Gendun Chopel (In One of the greatest scholars of modern times, Gendun Chopel lived from 1902-1951.) explained, we can examine with our intelligence and see that things do not really exist, but then, if we get stuck with a needle, we will have this very vivid experience of existence, and we will think, “Well, maybe there really is something there after all.” Thus, when we analyze with logical reasoning, we can gain certainty that things do not truly exist, but we still keep having experiences in which things seem to be so real, contradicting the results of our earlier analysis. This is why it is so difficult to gain certainty in emptiness.

If we did not have all of these experiences that seem so real and if we were not so certain that things exist, then understanding emptiness would be easy. We would not need to study it so much; we would not require so many explanations of it. However, because we believe so strongly in the existence of things and because we keep having all of these experiences that seem to confirm our belief that things are real, it is difficult for us to gain certainty in emptiness. This is why we need to study emptiness so much after all. It is just as if we had a dream and we did not know that we were dreaming. If someone in the dream came up to us and said, “None of this is real. It does not really exist,” we would not easily believe it.

The tradition of Nagarjuna is not the tradition of simply generating a belief or an opinion that things are empty and then proceeding to meditate on the basis of that. It is rather the tradition of cultivating in meditation the certainty that one has achieved through logical analysis. If you study this text in the stages in which it is laid out, its chapters that are the twenty-seven examinations of the emptiness of different subjects, then your certainty in emptiness will definitely grow broader, deeper, and stronger, and your meditation will be much more powerful.

PINGALA COMMENTARY

4/0 Question: The sutras state that there are five skandhas. What do you say about this?

CANDRAKĪRTI COMMENTARY

[Chapter VI]
Some may argue that, although vision and the other sense faculties are not real, the constitutive factors of personal existence (skandhas) (fn 1) are, because they have not been explicitly denied. The sense faculties, however, belong to the factors of personal existence and therefore will exist as well.

Matter cannot be understood as the cause of material objects; nor can these be understood as the effects of matter.

We reply that they would if the factors of personal existence were real. With reference to material objects (rupa) (fn 2), Nagarjuna says:

KALUPAHANA COMMENTARY

Chapter Four Examination of Aggregates (Skandha-parikṣa)

Chapter IV Examination of the Aggregates

The five aggregates are the basic Buddhist categories of personal constituents. The first - that discussed as an example in this chapter - is in Sanskrit rūpa, in Tibetan gzugs. Unfortunately, given the lexicography of Western philosophy, this word has historically been translated as “form.” This practice is so ubiquitous that I am loathe to depart from it, despite the confusion it engenders. For what the word means is matter. The other aggregates are sensation, perception, intellect, and the dispositions. It is important to realize that this taxonomy is to be understood pragmatically: There is no deep doctrinal or philosophical point that hangs on dividing the properties or capacities of humans up in just this way. In fact, most often the only important point about analysis in terms of the aggregates is that humans are composite. The precise nature of the best decomposition is of interest to psychology and to soteriological practitioners, but is at bottom, from the standpoint of the tradition, an empirical matter. (fn 44. That is not, of course, to say that it is arbitrary.) This chapter is motivated by the natural suggestion that even if vision itself is empty, as was argued in the previous chapter, there must be a truly existent basis for vision in the person and his/her faculties.

Nāgārjuna aims to demonstrate the emptiness of all of the constituents of the person by taking form as an example and applying arguments that are general in scope. Form is taken as an example precisely because it is the most solid, apparently nonempty of the aggregates - the one that we are most likely to reify. So the program is to use arguments with application to any of the aggregates and to apply them to the hardest case. The conclusion Nāgārjuna is after is that no decomposition of the person will yield constituents that are themselves independent and nonempty.

GARFIELD COMMENTARY

Chapter IV Examination of the Aggregates

The five aggregates are the basic Buddhist categories of personal constituents. The first - that discussed as an example in this chapter - is in Sanskrit rūpa, in Tibetan gzugs. Unfortunately, given the lexicography of Western philosophy, this word has historically been translated as “form.” This practice is so ubiquitous that I am loathe to depart from it, despite the confusion it engenders. For what the word means is matter. The other aggregates are sensation, perception, intellect, and the dispositions. It is important to realize that this taxonomy is to be understood pragmatically: There is no deep doctrinal or philosophical point that hangs on dividing the properties or capacities of humans up in just this way. In fact, most often the only important point about analysis in terms of the aggregates is that humans are composite. The precise nature of the best decomposition is of interest to psychology and to soteriological practitioners, but is at bottom, from the standpoint of the tradition, an empirical matter. (fn 44. That is not, of course, to say that it is arbitrary.) This chapter is motivated by the natural suggestion that even if vision itself is empty, as was argued in the previous chapter, there must be a truly existent basis for vision in the person and his/her faculties.

For the emptiness of vision was established in part by showing that perception depends upon the perceiver and the perceived. And that might seem to suggest that these bases - or at least the most essential one, the perceiver - truly exist. For then one could say that whereas vision itself is not inherently existent, it does exist as a relation between an inherently existent perceiver and an inherently existent object, or at least as a property of such a perceiver, even if there is truly no object. (fn 45. The reason for this second possibility is the possible presence of an idealist in the dialectical neighborhood, who might argue that even though neither seeing nor the seen inherently exists, both exist as illusions of the putative seer, who must exist, even if only as the subject of delusion.) Nāgārjuna aims to demonstrate the emptiness of all of the constituents of the person by taking form as an example and applying arguments that are general in scope. Form is taken as an example precisely because it is the most solid, apparently nonempty of the aggregates - the one that we are most likely to reify. So the program is to use arguments with application to any of the aggregates and to apply them to the hardest case. The conclusion Nāgārjuna is after is that no decomposition of the person will yield constituents that are themselves independent and nonempty.
ENGLISH TRANSLATIONS

INADA (Skt):
Verse 1 - Material form (rupa) separated from the efficient cause (karana) cannot be conceived. Moreover, separated from material form the efficient cause cannot be seen. - Note: The causes are in reference to the Four Great Elements Earth, Water, Fire, and Wind.

JONES (Skt):
[i] Apart from the cause of the material form of the body, the form is not perceived; apart from form, its cause is not seen.

KALUPAHANA (Skt):
Material form, distinct from the cause of material form, is not obtained. Similarly, a cause of material form, distinct from material form, is also not seen.

MCCAGNEY (Skt):
Material form separated from the cause of material form is not obtained. And the cause of material form separated from material form is not seen.

NISHIJIMA (Skt?):
1. When all things and phenomena, or material substances, are separated and at random,
Even the form of things and phenomena are not perceived actually.
And even though relying upon all things and phenomena, there is no separation and freedom.
The oneness of all things and phenomena, or material substances, can be seen as they are.

SPRUNG (Skt):
1 Objects are not perceived apart from matter as their cause; matter as cause is not perceived apart from objects.

STRENG (Skt):
1. Visible form (rupa) is not perceived without the basic cause of visible form (rupakarana); Likewise the basic cause of visible form does not appear without the visible form.

BOCKING (Ch):
4v1 Form that is separate from the cause of form is inconceivable
A cause of form separate from form is inconceivable

BATCHelor (Tb):
Apart from the cause of form, form is not perceived.
Apart from "form", the cause of form also does not appear.

DOCTOR (Tb):
Apart from the cause of form, Form is not observed.
Likewise, aside from so-called form, No cause of form can be observed either. [IV.1]

GARFIELD (Tb):
1. Apart from the cause of form, Form cannot be conceived.
Apart from form, The cause of form is not seen.

GARFIELD-SAMTEN (Tb):
1. Apart from the cause of form, Form cannot be conceived.
Apart from form, The cause of form is not apparent.

HAGEN (paraphrase):
Matter, apart from the cause of matter, is not conceivable. So too, the cause of matter, apart from matter, is never found.

GOLDFIELD (Tb):
Except for there being the cause of form, Form would not be seen.
Except for there being what we call "form," The cause of form would not appear either. (1)
PINGALA COMMENTARY

4/1 As for 'cause of form'. It is like threads being the cause of the cloth. If you take away the threads, there is no cloth, and if you cast away the cloth, there is no thread. The cloth is like form, the threads are like its cause.

Question: What is the error in saying that form exists separately from its cause?

Reply:

CANDRAKĪRTI COMMENTARY

Here ‘objects’ means particular material objects (bhautika rupa), and their material cause (karana) are the four elements (in 3 Earth, air, fire, water). One does not perceive objects — the physical particulars (sights, sounds, smells, tastes, and touch) separated from the four elements and existing by themselves as a piece of cloth is separate from a jar (in 4 That is, a perceived object is inseparable from a material base). And matter as cause (rupa-karana) is not perceived existing by itself apart from objects. Wishing to establish this double claim Nagarjuna says:

KALUPAHANA COMMENTARY

From among the five aggregates (skandha), Nagarjuna selects material form (rupa), and not one of the explicitly psychological aggregates such as feeling, perception, disposition, or consciousness. The reason is clear. He has already examined the process of perception and, therefore, needs to analyse the object of perception, rather than perception itself.

In the discourses, material form (rupa) was analysed into the four great elements (cattaro mahabhuta) and the elements derived from these four (catunnam mahabhutanam upadaya rupam) (M 2.87). In their attempt to determine what these derived elements were, the Abhidharmikas scanned all the discourses looking for any element (dhavma) that would be predominately material and compiled varying lists. As a result of speculation on these different lists, there came to be a distinction between gross matter (sthula-rupa) and subtle matter (suksma-rupa). Yet, it was assumed that the four great elements constituted the foundation of all forms of matter.

When the question regarding the nature of the four great elements was raised, the Buddha maintained that these consist of hardness and rigidity (kakkhalam kharigatam) which is earth (pathavi), watery element (apogata) which is water (apo), the fiery element (tejogatam) which is fire (tejo), and the airy (vayogatam) which is air (vayo) (M 1.421 ff.). This explains the manner in which they are experienced. However, the interpreters of the Abhidharma began to define them as "the four elements that support self-nature as well as derived form" (svalaksanopadayarupadharanad dhatavah, Akb). An almost identical definition was gradually being offered for the conception of dharma (svasamanyalaksanadharanad dhammah, Sakv p. 12) where svalaksana refers to self-nature or substance and samanyalaksana to "general characteristics" or "quality," the latter corresponding in some way to the derived elements. These ideas appeared in the Theravada tradition only in the Abhidhamma commentaries and the later manuals and sub-commentaries (e.g., sabhava-samanna-lakkhanam dharetiti dhamma, Abhvt ). Thus, with the Sarvastivada speculation, two new categories were emerging: substance and characteristics which ultimately involved a one-way relationship. The substances serve as the cause (karana) of characteristics, but not vice versa.

Even though these speculations are recorded in treatises composed long after Nagarjuna, they did not originate with such treatises but were prevalent during his day or even before, as is evident from a careful reading of the Karika. It is the above mentioned substantialist view of material form (rupa) that is criticized in the present verse. For Nagarjuna (as well as for the Buddha), material form distinct from the cause of material form (rupa-karana = mahabhuta) is not acceptable. Similarly, a cause of material form distinct from material form is also not experienced. Here there is no denial of material form, but only a rejection of the idea that there is an invisible ground of material form.
1. Nāgārjuna begins by making use of the results of the first chapter. Nothing arises causelessly, and no cause is ineffectual. So if any form exists, it exists with a cause. And if the cause of any form exists, so does that form. But there is an interesting problem to be posed: How about form itself - matter considered in general, not in its specific instances? Does it have a cause or not? This question is important because it gets at the question of whether we can imagine ultimate ontological categories that exist independently. If form has a cause at all, it must be either the same or different from form. If the former, we have an infinite regress. If the latter, then we have the absurd conclusion that immaterial things can cause material things to come into existence. If it has no cause, then it cannot be said to exist at all. (fn 46. We must understand “form” in this context to designate physical reality as a whole, including matter and energy. We can presume (bypassing hagiographic considerations) that Nāgārjuna was unaware of the relativistic understanding of the interchangeability of these two; but it is clear that, from the standpoint of "skandha theory," the operative contrast is between the physical and the nonphysical. (And here, given the antisubstantial metaphysics in play, “nonphysical” does not mean made of spook stuff.) Form is just whatever is susceptible of physical description and explanation. Many kinds of supervenience are compatible with the decomposition suggested by Buddhist psychology.)

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 2 - If material form is separated from efficient cause, then it follows that form will be without a cause. However, nowhere is there a thing existing without a cause.

JONES (Skt):
[2] If there were form apart from its cause, then the form would be without a cause. But nowhere is there any effect without a cause.

KALUPAHANA (Skt):
When material form is [considered to be] distinct from the cause of material form, it follows that material form is without a cause. Nowhere is there any effect without a cause.

MCCAGNEY (Skt):
If material form separated from the cause of material form occurs, then there is material form without a cause. But there is not any effect without a cause anywhere.

NISHIJIMA (Skt?):
2. When all things and phenomena, or material substance, are separated and at random, Relying upon all things and phenomena, and attached to all things and phenomena, What is not reasonable, does never exist as aim, But at the same time something unreasonable might exists somewhere.

SPRUNG (Skt):
2 If objects exist apart from matter as their cause, objects must be uncaused; but nothing is ever without a cause.

STRENG (Skt):
2. If the visible form existed apart from its basic cause, it would logically follow that visible form is without cause; But there is nothing anywhere arising without cause.

WESTERHOFF (Skt):
IV.2 No object whatsoever exists without being caused.
PINGALA COMMENTARY

4/2 It is like a cloth existing separately from its threads, which would be a cloth without a cause. Things which are uncaused and yet exist are not found anywhere in the world.

Question: In the Buddha-dharma, in the doctrines of outsiders (non-Buddhists) and in worldly teachings there are dharmas which are uncaused. Buddhism has the three inactive (dharmas) which, being inactive are permanent and therefore without causes. In the non-Buddhist teachings they have space, time, direction, soul, atoms, nirvana and so forth. In the teachings of the ordinary world there are emptiness, time, direction and so on. These three dharmas, being nowhere non-existent are consequently called 'permanent'. Being permanent, they are uncaused, so how can you say that uncaused dharmas do not exist in the world?

(6c3) Reply. These 'uncaused dharmas' only exist as figures of speech. If we ponder and analyze them we find they are non-existent. If dharmas have their being through causes and conditions, we ought not to say that they are uncaused. If they have no causes and conditions then it is as we have said.

Question. Causes are of two kinds. One is the actual cause, the other is the 'figurative cause'. These 'uncaused dharmas' have no actual cause, they merely have a figurative cause, to make people know of them.

Reply. Although they have figurative causes, you are not correct. Just as 'Space' is refuted, in the (next chapter on the) six elements, so the remaining items will be refuted later. Moreover, since even visible things can be refuted, how much more so atoms and other invisible things? This is why we state that there are no uncaused dharmas in the world.

Question: If (we said that) the cause of form existed separately from form, what would be wrong with that?

Reply:

CANDRAKĪRTI COMMENTARY

As a piece of cloth, being another thing than a pot, cannot be caused by the pot, so objects — material particulars cannot be caused by the four elements if thought of as separated from them. But, 'Nothing is ever without a cause.' Therefore, because causelessness is logically absurd, it cannot be accepted that objects are separate from matter as their cause.

Now, to show that matter as cause cannot exist apart from objects, Nagarjuna says:

KALUPAHANA COMMENTARY

It is the sharp distinction between material form and its assumed cause that was posing an epistemological problem for Nagarjuna. In fact, evidence from a later Theravada sub-commentary seems to indicate that a school with Sautrantika leanings was trying to eliminate the distinction between these two ideas. Referring to the definition of dhamma mentioned in relation to IV. 1. It is said: "There is no dhamma over and above the nature of supporting," [na ca dhariyamana-sabhava añño dhammo nama atthi], DhsT p. 21; see also my article, "Schools of Buddhism in Early Ceylon," in The Ceylon Journal of the Humanities, Peradeniya 1 (1970):78], a view that resembles the one presented by George Berkeley during modern times.

Nagarjuna seems to be unwilling to accept such a solution. Considering the philosophical issues a philosopher like Berkeley had to face, one can understand Nagarjuna's unwillingness to subscribe to such a view. Without allowing the experienced elements (dharma) to hang loose, Nagarjuna was interested in providing a causal explanation. Therefore, following the Buddha's explanation of "dependent arising", Nagarjuna boldly asserts: "Nowhere is there any effect without a cause," (see also XXIV. 19, aprati tyasamutpanno dhammah kascin na vidyate).
2. If form as such exists without any cause, we would have an example of an inherently existent category. But that would also violate the principle of dependent origination. That is, both Nāgārjuna and his opponent agree that all phenomena are dependently originated, and the discussion in the present chapter is in fact directed at figuring out just what material form depends on. So an attempt to posit material form as inherently existent on the grounds that it comes into existence causelessly is an ad hoc move that is unavailable to any participant in this debate. Moreover, Nāgārjuna points out in the next verse, if we held form to be dependent upon a cause that was itself inherently existent, we would have an inherently existing cause without an inherently existing effect. That putative cause would, hence, fail to be a cause in the full sense. Between genuine causes and their effects there is a relation of dependence. For something to count as a cause independent of its producing an effect would be incoherent. But since in the context of inherent existence merely conventional existence counts as no existence at all, an inherently existent cause with a merely conventionally existent effect would count just as much as an ineffective cause. So neither can we make sense of an inherently existent cause of the existence of material form if material form is held not to be inherently existent.
Kārikā IV.3

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 3 - Granted that separated from material form an
efficient cause of form exists, then there will be a cause
without an effect. But a cause without an effect (in reality)
does no exist.

JONES (Skt):
[3] If there were a cause of form apart from form, then the
cause would be without an effect. But there is no cause
without an effect.

KALUPAHANA (Skt):
If there were to be a cause of material form distinct from
material form, there would then be a cause without an
effect. There certainly is no ineffective cause.

MCCAGNEY (Skt):
But if, in material form, there would be material form and
the cause of material form separated in two parts,
then there would be a cause without an effect. There is no
cause without an effect.

NISHIJIMA (Skt?):
3. Relying upon all things and phenomena, it is situations of
freedom now,
And then it might be oneness between all things and phenomena,
or material existence.
What is in an impossible situation to do, might be what can not be
done actually,
And both what can not be done actually, or what might be only
material, do not actually exist.

SPRUNG (Skt):
3 If matter as cause were separate from objects, Matter
as cause would be without any effect. There is no
cause without an effect.

STRENG (Skt):
3. On the other hand, if there would be a basic cause
apart from visible form, The basic cause would be
without any product; but there is no basic cause
without a product.

ROBINSON (Skt):
If cause-of-form existed disjoined from form, then there
would be an effectless cause [Therefore cause-of-form
does not exist disjoined from form.].

BOCKING (Ch):
4v3 If its cause existed, separate from form.
Then this 'cause' would be without an effect.
If you are saying that there are causes without effects –
This circumstance does not exist.

BATCHelor (Tb):
If a cause of form existed apart from form, it would exist
as a cause without fruit; causes without fruit do not
exist.

DOCTOR (Tb):
If, aside from form,
There were a cause of form,
There would be a cause with no effect,
Yet there are no causes without effects. [IV.3]

GARFIELD (Tb):
3. If apart from form
There were a cause of form,
It would be a cause without an effect.
But there are no causes without effects.

GARFIELD-SAMten (Tb):
3. If apart from form
There were a cause of form,
It would be a cause without an effect.
But there are no causes without effects.

HAGEN (paraphrase):
Were there a cause of matter apart from matter, there
would be a cause without an effect. But never is a
cause found without an effect.
PINGALA COMMENTARY

4/3 If we eliminate the effect, i.e. form, and merely have the cause of form, this would be a cause without an effect.

Question: What is wrong with there being a cause with no effect?

Reply: Nowhere in the world do you find a cause without an effect, and why? It is by virtue of its effect that we call something a cause. If there is no effect, how can you call it a cause?

Moreover, if there is no effect within the cause, why should things not arise from no-cause? This topic is similar to that dealt with in chapter one, on the refutation of causality. Therefore, no cause exists without an effect.

CANDRAKĪRTI COMMENTARY

3ab If matter as cause were separate from objects

If, that is, matter as cause were separate from objects as its effects then, just as the frying pan taken as separate from the pot cannot be the cause of the pot, so if matter as cause is conceived as existing separated from its effects,

3c Matter as cause would be without any effect.

It would be effectless. The condition for the causality of a cause is that it produces an effect. There is no production of an effect if this is thought of as separated from a material cause unrelated to the effect. Nagarjuna says that a cause without an effect, because it does not cause anything, does not exist, like the horns of a man or of a snake or of a horse.

3d There is no cause without an effect.

Further, what is taken to be the material cause of objects must be taken as the cause either of an object which exists or of one which does not exist. Nagarjuna says that neither way is logically possible.

KALUPAHANA COMMENTARY

The statement in the previous verse: “Nowhere is there an effect without a cause,” (na casti arthah kascid ahetukah kvacit) could lead to the belief in an invisible ultimate cause (like substance, or even God) that is eternal. While the characteristics, perceived qualities, etc. could be looked upon as the experienced, yet variable, effects, their ultimate ground would be the substance, eternally existing even when it is not producing the effects. Realizing that such a view could emerge from his previous assertion, Nagarjuna immediately proceeds to nip it in the bud when he insists: “There is no in-effect-ive cause.” Thus, IV.2 and 3, in combination should provide the interpreters of Nagarjuna with the clearest evidence that he was upholding the theory of dependent arising” (prati tyasamutpada) in the form in which it was formulated by the Buddha in the early discourses.

INADA (Skt):
Verse 4 - When material form exists, its cause is untenable. Moreover, even when material form does not exist, its cause is (likewise) untenable.

JONES (Skt):
[4] If the form were already existing, its cause would not be occurring; and if the form were not existing, its cause would also not occur.

KALUPAHANA (Skt):
When a material form exists, a cause of material form is not appropriate. When a material form does not exist, a cause of material form is also not appropriate.

MCCAGNEY (Skt):
Where material form is, the cause of material form does not occur. Where material form is not, the cause of material form does not occur.

NISHIJIMA (Skt?):
4. Because of being in all things and phenomena, they belong just to all things and phenomena. Material existence does not manifest itself. Even when all things and phenomena do not exist in all things and phenomena, Material existence does not manifest itself.

SPRUNG (Skt):
4. Matter as cause of an object which exists is not logically possible; matter as cause of an object which does not exist is not logically possible.

STRENG (Skt):
4. Just as when there is visible form no basic cause of form obtains, So when there is no visible form no basic cause of form obtains.

BOCKING (Ch):
4v4 If form were already existent, Then it would have no use for a 'cause of form'. If form did not exist Then, too, it would have no use for form.

BATCHELOR (Tb):
If form existed, a cause of form would be untenable; if form did not exist, a cause of form would be untenable.

DOCTOR (Tb):
When form exists, A cause of form does not make sense, Yet when form does not exist, A cause of form does not make sense either. [IV.4]

GARFIELD (Tb):
4. When form exists, A cause of the arising of form is not tenable. When form is non-existent, A cause of the arising of form is not tenable.

GARFIELD-SAMTEN (Tb):
4. When form exists, A cause of form is not tenable. When form is nonexistent, A cause of form is not tenable.

HAGEN (paraphrase):
When matter exists, its cause makes no sense. When matter doesn’t exist, its cause makes no sense.
PINGALA COMMENTARY

4/4 In neither case is there a cause for form. If form preexisted in the cause, the cause would not be called the cause of form. If no form pre-existed in the cause, in that case too the cause would be termed the cause of form.

Question: If both these cases are wrong, then what is wrong with there being simply uncaused form?

Reply:

CANDRAKĪRTI COMMENTARY

If an object is in being (*sant*), that is, factually exists (*sam-vidyamana*), what would be the point of its having a material cause? If an object is not in being, that is, does not factually exist, what could be the meaning of its ‘cause’? What would one suppose such a cause to be the cause of? So, if an object does not exist, its cause is not logically possible.

You may say: Although a material cause of objects is in this way not logically possible, none the less objects exist in fact as effects and because of their real existence matter as cause will exist as well. This would be so if the object as effect existed, but it does not. So,

KALUPAHANA COMMENTARY

Here Nagarjuna is reverting back to the criticisms he made of the Sarvastivada and Sautrantika views in Chapter I. The first is the identity theory of causation and the second, the non-identity theory, and these criticisms are here applied to the causality of material form (*rupa*).

GARFIELD COMMENTARY

4. Any relationship between form and a putative cause is unintelligible, Nāgārjuna argues, following closely the reasoning in Chapter I. If form exists, the cause has ceased to exist. If form does not exist, the cause cannot have existed. This might seem at first glance to be a wholesale rejection of the possibility of dependency of effects on causal conditions. But if we recall the moral of Chapter I and keep the dialectical context of the current chapter firmly in mind we will see that this is not so: The paradox of causal contact arises - as Sextus also notes - only if we suppose that the causes we appeal to in explanation must have some special force by means of which they bring about their effects. That, as we have seen, is the view of the causal link as inherently existent and, hence, of causes as inherently existent. The opponent Nāgārjuna is attacking in this chapter is one who thinks that form/matter is inherently existent, but who has granted that all individual phenomena - all particular forms, such as human bodies, tables, and chairs - are dependently arisen. So the opponent agrees that all phenomena must be explicable. But the opponent wants to reify form, and that is to treat it as a phenomenon albeit an inherently existent one. Therefore, it must, for the opponent, have an explanation of its existence, and since its existence is inherent existence, it must be an explanation in terms of inherently existent causation. So all that Nāgārjuna has to do is to remind the opponent of the incoherence of that notion in order to undermine the view that form as such is inherently existent. The coherence of conventional dependent origination is not at issue.

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 5 - Again, material form without a cause definitely is untenable. Therefore, any material form which has been thought of (i.e., becomes a concept) should not (become the basis of) further conceptualization.

JONES (Skt):
5 However, a form without a cause does not occur. Therefore one should not generate thoughts of distinctions relating to form.

KALUPAHANA (Skt):
Furthermore, a material form without a cause is absolutely inappropriate. Therefore, one should not discriminatively think of anything confined to material form.

MCCAGNEY (Skt):
Again, material form without a cause does not occur. Therefore, one should not conjecture about any false discriminations about material forms.

NISHIJIMA (Skt?):
5. The facts that what does not have any cause produces any kinds of things and phenomena again, Do never, never, manifest themselves at all. Therefore all things and phenomena have been produced a little bit already, And so there is no possibility to be replaced with another contents, or to be desired to be replaced with others.

SPRUNG (Skt):
5 An object without a material cause is not, repeat not, logically possible. Should not form any theories at all concerning objects.

STRENG (Skt):
5. Furthermore, it does not obtain that no visible form exists without a basic cause, One should not construe any constructs concerning the form.
PINGALA COMMENTARY

4/5 Whether the effect inheres in the cause, or whether no effect inheres in the cause: such matters remain inconceivable. How much more so the existence of form without cause? This is why it is said 'for form to exist and yet be uncaused - this is altogether wrong', and therefore one who has insight should not analyze form.

'Analyzer' is a name for the common man who, bound by ignorance, desire and attachment to form, consequently develops from his perverted views distinctions and vain arguments, speculating that the effect inheres or does not inhere in the cause, and so forth. If you search for form in this way, it is never attainable, and therefore a man of insight should not analyze.

Further.

CANDRAKĪRTI COMMENTARY

5ab An object without a material cause is not, repeat not, logically possible.

How it is that there is no material cause has been shown. But if there is no material cause, how could there be an object as an effect which has no cause? By the double rejection of the emphatic ‘not, repeat not’ Nagarjuna makes clear the harmfulness of the view that things can be without causes.

And thus, on being considered from every aspect, a perceptible material object (rupa) is not possible. Therefore the wise one (yogi), who sees things as they really are,

5cd Should not form any theories at all concerning objects.

The meaning is that he does not take objects to be the external base (alambana) to which are attributed such characteristics as penetrable or impenetrable, veridically perceivable or not veridically perceivable, past or future, light or dark.

Whether one thinks that matter as cause gives rise to an effect which is identical with or not identical with itself, neither alternative is logically possible. Nagarjuna says:

KALUPAHANA COMMENTARY

A theory of an uncaused event, as reiterated, was clearly unacceptable to Nagarjuna. Indeed, it is emphasized by the repetition of the negation, naiva. Not accepting the epistemology that is generally and indiscriminately attributed to Nagarjuna, we have avoided translating the term vikalpa either as "conceptualization" or "conceptual construction" or even "discrimination," (see Introduction). The importance of the term rupagatan cannot be over-emphasized. The comments on the previous verses show to what extent speculation "confined" strictly to material form (rupa) led to all kinds of weird philosophical theories. The analysis of material form should be undertaken in relation to various other issues, especially language and epistemology. In the last few verses, Nagarjuna was engaged precisely in such an enterprise. Hence his advice in the present verse. The suffix -gata is better understood in the meaning in which it occurs in phrases like kaya-gata ("confined to the body"), hasta-gata ("confined to the hand"), etc.

GARFIELD COMMENTARY

5. The moral of these arguments, Nāgārjuna concludes, is that we cannot think of form as such as an entity at all. Individual forms are entities - dependently arisen ones, hence, empty of inherent existence. But form itself is an abstraction, neither caused nor uncaused, but dependent upon the existence of material things with form. (Moreover, were one to argue that form itself exists as an entity, one would be faced with an uncomfortable dilemma: Its existence would be caused or uncaused. The latter alternative patently begs the question regarding the explanation of the existence of the material world. But the former issues in a further dilemma: The cause would either itself be material or immaterial. On the first horn, we have an infinite regress; on the second, the inexplicable causation of the material by the immaterial.) (fn 47. See also Kalupahana (1986), p. 38, for a similar analysis.) So, he advises, think carefully about what form is and about the nature of particular material objects. But do not construct theories that purport to describe the essence of material form. For there is no such thing. It is simply a characteristic of -individual material objects and, hence, something that depends upon their existence, with no essence of its own.

380
Kārikā IV.6

na kāraṇasya sadṛśaṁ kāryam ity upapadyate
na kāraṇasyāsadṛśaṁ kāryam ity upapadyate [6]|

| 'bras bu rgyu dañ mi ’dra (7)žes | | bya ba’an ’thad pa ma yin no |

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 6 - It is untenable that the effect will resemble the efficient cause. Again, it is untenable that the effect will not resemble the efficient cause.

JONES (Skt):
[6] Identifying the cause with the effect is not appropriate. But not identifying the cause with the effect is also not appropriate.

KALUPAHANA (Skt):
The view that the effect is identical with the cause is not appropriate. The view that the effect is not identical with the cause is also not appropriate.

MCCAGNEY (Skt):
The statement “the effect is similar to the cause” does not obtain.
The statement “the effect is not similar to the cause” does not obtain.

NISHIJIMA (Skt?):
6. It is not imitation of material stuff, But it is just the work, which has been actually created. It is not purely material substance itself, But it is just the work, which has been actually created.

SPRUNG (Skt):
6 It is not logically possible that an effect is identical with its cause. It is not logically possible that an effect is not identical with its cause.

STRENG (Skt):
6. Just as it does not obtain that the product is the same as the cause, So it does not obtain that product is not the same as the cause.
PINGALA COMMENTARY

4/6 If you say that the effect and the cause resemble each other, this is not correct, because the cause is subtle, the effect gross. Cause and effect, form and function etc. are different from each other. Just as cloth is similar to thread, but we do not call thread 'cloth', for threads are many but cloth is one, so we cannot say that cause and effect resemble each other. To say that cause and effect do not resemble each other is also wrong, for just as hempen thread does not make thin silk, and coarse thread will not produce fine cloth, we cannot say that cause and effect are dissimilar. Both ideas are wrong, so there is neither form, nor cause–of–form.

CANDRAKĪRTI COMMENTARY

It is commonly supposed that matter (rupakarana) is by its inherent nature solid, liquid, warm and mobile. Particular material objects (bautika), however, whether they are personal like the eye and the other sense faculties which are by nature of a subtle matter and are the base of visual and the other types of sense consciousness, or whether they are the external sense fields like the visible whose nature it is to be perceived in the various types of sense consciousness, do not possess the inherent nature of the four elements. It follows that, because they have different characteristics, cause, i.e. matter, and effect, i.e. material objects, are not identical, as in the case of nirvāna (in 5 Candrakirti seems to be saying that cause and effect, like samsāra and nirvāna are so different that no statement about their relationship is possible). 'It is not logically possible that an effect is identical with its cause.'

Further, one never sees the real dependence in the relationship of cause to effect, even when they are identical like the rice seed and the ripe grain. 'It is not logically possible that an effect is identical with its cause.'

And again, 'It is not logically possible that an effect is not identical with its cause.' The meaning here is that it is so because they have different characteristics, as in the case of nirvāna.

So perceivable material objects, on being investigated, are not logically possible in any way at all. Nagarjuna extends this conclusion to feeling and the other constitutive factors of personal existence as well.

The same procedure holds for the other factors of personal existence.

KALUPAHANA COMMENTARY

Unlike IV.4 which states the inappropriateness of identity and non-identity theories of causation applied specifically to the subject matter under discussion, namely, material form (rupa), the present verse emphasizes the inappropriateness of identity and non-identity theories in general.

GARFIELD COMMENTARY

6. We cannot say that nonmaterial things give rise to the existence of matter, for that would be an inexplicable miracle. Nor can we say that matter gives rise to matter, since that would beg the question. But there is no other possibility. So despite the reificationist’s intuition that though individual material objects may be empty, the matter they are made of is nonempty, we see that we cannot even clearly conceive of the nature of matter as such independently of material objects. Matter, too, is hence dependent and empty of inherent existence. Nāgārjuna immediately generalizes this to the other aggregates:

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 7 - Feeling, mind, awareness, volitional plays, and all existential actions can each be discussed in the same manner as material form.

JONES (Skt):
[7] The same method of analysis applies to all the other aggregates of the body - feelings, consciousness, perceptions, and dispositions - and to all entities with form.

KALUPAHANA (Skt):
The method of treatment of all existents such as feeling, thought, perception and dispositions is in every way similar to that of material form.

MCCAGNEY (Skt):
Feelings, thoughts, perceptions, and dispositions in general, as well as the totality of beings follow the same rule as material form.

NISHIJIMA (Skt?):
7. Mental function to get something is always mutual understandings.
It is always an effort to include everything into one perfectly. Therefore the all kinds of researches are just belonging to miscellaneous existences, And just relying upon all things and phenomena, everything is going on ahead.

SPRUNG (Skt):
7 The inquiry into material objects holds in every essential for feeling, consciousness, ideation and personal dispositions - for all the factors of personal existence.

STRENG (Skt):
7. Also, sensation, thought, mental conception, conditioned elements (samskara) and All "things" (bhava) are to be dealt with in the same way as visible form.

BOCKING (Ch):
4v7 The skandha of reception, the skandha of conception the skandhas of predisposition and consciousness And all remaining dharmas.
May be taken together with the skandha of form.

BATCHELOW (Tb):
Feeling and perception, impulses and mind and all things are comparable in every aspect, at every stage with form.

DOCTOR (Tb):
With feeling, identification, formation, Mind, and all things The steps are, in all regards, The same as in the case of form. [IV.7]

GARFIELD (Tb):
7. Feelings, discriminations, and dispositions And consciousness and all such things Should be thought of In the same way as material form.

GARFIELD-SAMTEN (Tb):
7. Feelings, discriminations, dispositions, Consciousness and all such things Should be thought of in every way In the same way as form.

HAGEN (paraphrase):
Sensation, conception, inclination, and perception can be thought of in the same manner as matter.

GOLDFIELD (Tb):
Feelings, discriminations, formations, Minds, and all the things there are Are susceptible to the same stages of analysis That forms have been put through here. (7)
PINGALA COMMENTARY

4/7 The (other) four skandhas and all dharmas should also be contemplated and refuted in the same way. And now the author, wishing to extol the idea of emptiness, says in a verse;

CANDRAKĪRTI COMMENTARY

Feeling and all the constitutive factors of personal existence may suitably be considered in the same way as material objects have been (fn 6 That is, each factor appears to be dependent on appropriate causes; on being examined, however, it is found to be unintelligible either as caused or uncaused: it is devoid of being.). Precisely as the absence of being (śunya), as conceived by Madhyamika, is expounded for one thing (dharma), precisely so is it to be expounded for all things. And so:

Any refutation of madhyamika must beg the question

KALUPAHANA COMMENTARY

The previous comments on the contents of this chapter would indicate that Nagarjuna did not deny the reality of material form but only the method of explaining it. A similar treatment is requested of the other aggregates too. Note the use of the term bhava in the present context, which prompts Inada to render it as "existential actions" (compared with its usage at I.3 which Inada translated as "entities").
ENGLISH TRANSLATIONS

INADA (Skt):
Verse 8 - When a refutation is based on sunyata and an opponent counter-refutes, he is not able to counter-refute everything since the counter-refutation will be the same (nature) as the contention (sadhya).

JONES (Skt):
[8] In a dispute, when one makes a refutation utilizing emptiness as the means, everything one says remains unrefuted and will be an equivalent to whatever is to be proved.

KALUPAHANA (Skt):
When an analysis is made in terms of emptiness, whosoever were to address a refutation, all that is left unrefuted by him will be equal to what is yet to be proved.

MCCAGNEY (Skt):
Whoever argues against openness for the sake of refuting an argument, all his refutations do not refute for he is conquered by the same proof.

NISHIJIMA (Skt?):
8. Everything, which is scattered separately at random, is prone to be avoided,
And the creations of the balanced and quiet states, might be talked.
Everything is belonging to the real world, which is not avoided from everything,
And everything is born relying upon the regulated conditions.

SPRUNG (Skt):
8 If a counter-argument has been given in terms of the absence of being and someone would offer a refutation of it, he refutes nothing because everything he says presupposes what has to be proved.

STRENG (Skt):
8. Whoever argues against "emptiness" in order to refute an argument, For him everything, including the point of contention (sadhya) is known to be un-refuted.
Note: This is an extremely subtle and cryptic verse which Candrakīrti clarifies as a play between with self-nature and without self-nature. The Madhyamika with its refutation based on sunyata always maintains the latter, nihsvabhava, of all entities.

CANDRAKĪRTI COMMENTARY

Here ‘counter-argument’ means discrediting the view of another; ‘in terms of the absence of being’ (sunyataya) means by showing that objects are without a self-existent nature so the view that they have a self-existent nature is ruled out. If an opponent would offer a refutation of this, saying, ‘but as feeling, ideas and so on are real, so objects must be real too’, everything he says lacks the force of a refutation because the actual existence of feeling, ideas and so on must be known in the same way as the actual existence of objects: which is what has to be proved.

Even as material objects, on being thoroughly investigated, do not actually exist either as being one with their cause or different. They are like contact and the other factors of the death-birth cycle: all of these are just what has to be proved. And as feeling and so on are the same as what has to be proved, so attributes and the subject of attributes, effect and cause, whole and part and such concepts are things which, like material objects, are just what has to be proved. How could an opponent offer a refutation? His every assertion will be just what has to be proved. Throughout this treatise Nagarjuna teaches that for Madhyamika it is to be taken as a rule that refutations offered by opponents are instances of petitio principia (fn 7 A succinct restatement of Chapter I).

Even as this is the invariable rule concerning the invalidation of the view of an opponent, so, concerning an expository statement, Nagarjuna says:
Kārikā IV.9

vyākhyaṇe ya upālabham kṛte śūnyatāyā vadet |
sarvaṃ tasyānupalabdham samaṃ sādhyena jāyate |[9]|

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 9 - When an exposition is based on sunyata and an opponent censors, he is not able to censor everything since the censorship will be the same (nature) as the contention.

JONES (Skt):
[9] When one makes an explanation by means of emptiness, everything one says remains unopposed and will be an equivalent to whatever is to be proved.

KALUPAHANA (Skt):
When an explanation in terms of emptiness is given, whosoever were to address a censure, all that is left uncensored by him will be equal to what is yet to be proved.

MCCAGNEY (Skt):
Whoever explains by means of openness for the sake of ascertaining, all his ascertainments do not ascertain for he is conquered by the same demonstration.

NISHIJIMA (Skt?):
9. With miscellaneous explanations in detail, many kinds of defaults have been indicated and explained, And the creations of the balanced state in the autonomic nervous system, might be talked. Everything, which belongs to reality, does not have any default to be criticized, Therefore everything has been born similarly being in well-regulated situations actually.

SPRUNG (Skt):
9 If, after an exposition has been made in terms of the absence of being, someone were to offer a criticism, nothing he says will be a criticism because it will be just what has to be proved.

STRENG (Skt):
9. Whoever argues by means of "emptiness" in order to explain an understanding, For him, everything including the point to be proved (sadhya) is known to be misunderstood.
PINGALA COMMENTARY

4/9 If, during a discussion, each party seizes on to a particular position and they debate without reference to the idea of emptiness they will never conclude the debate, and all will be together in doubt. For example, a man says 'a jug is impermanent'. His opponent says 'why is it impermanent'? and he replies 'because it arises from an impermanent cause'. This is not what one would call an answer. Why not? Because there is still the uncertainty of not knowing whether the cause is permanent or impermanent.

(7a25) If, wishing to explain the other's erroneous views, he simply declares, without relying on emptiness, that all dharmas are impermanent, this is not what one would call a criticism, and why? Because you by your 'impermanence' have refuted my 'permanence' but I by my 'permanence' can refute your 'impermanence', saying that if things truly were impermanent there would be no karma and consequences, that the dharmas of eye and ear, etc., would cease every instant and that there would be no distinctions (between sin and merit etc.). Such fallacies as these will never succeed as criticisms, being at the same level as the opponent's doubts.

(7bl) However, if one relies on emptiness to refute permanence, no error is involved, and why? Because such a man does not cling to the mark of 'emptiness'. Therefore if one even wants to debate, he should rely upon the idea of emptiness; how much more so if he desires to seek the characteristic of release from affliction, and calm extinction.

CANDRAKĪRTI COMMENTARY

If during an exposition some pseudo-disciple raises a critical objection, that very objection, it should be known, will be just what has to be proved, as in the case of a counter-argument.

To quote: 'Who sees one thing truly, it should be remembered, sees all things truly. The absence of being in one thing is the absence of being in all things.'

And from the Gaganaganjasamadhi Sutra: 'The one who by examining one putative element realizes that all putative elements are like a magical show, like a mirage: unintelligible, false, deceptive and perishable, he is the one who progresses directly to the haven of enlightenment.'

And from the Samadhira Sutra as well: 'Just as you have understood the concept of the self, so should you turn your mind to all things; all putative elements have the same nature as the self: they are as transparent as the heavens. The one who from one thing knows all things and from one thing sees all things, in him, whatever the paths of his thought, there will be no egomania.'

KALUPAHANA COMMENTARY

These two subtle and cryptic verses can best be understood in the context in which they appear. They are placed at the end of an extremely important analysis of the metaphysics relating to material form (rupa). As such they should be considered the conclusion of that analysis.

The basic theme of the chapter has been the rejection of any metaphysical substance (svabhava) as the cause of material form (rupa-karana). Indeed, there was no rejection of the cause of material form, only the criticism of the view that this cause is an invisible permanent entity distinct from the perceived material form. This criticism if referred to at IV.8 as "an analysis in terms of emptiness" (sanyataya vigrahake krte). Interestingly, the term "emptiness" (sanyata) never occurred in that analysis. The analysis was made on the basis of mutual "dependence" of material form (rupa) and the cause of material form (rupa-karana). Thus, material form and the cause are empty of substance because they are mutually dependent. At this stage, if someone were to present a refutation of Nagarjuna's view, that refutation would be intended as a refutation of the "mutual dependence" of the material form and its cause. However, such a refutation does not automatically prove the validity of the metaphysical idea, namely, svabhava that is being rejected by Nagarjuna on the basis of "dependence." The argument in favor of dependence is experience. Hence, the person presenting a refutation of this idea should be in a position not only to negate "mutual dependence" but also provide evidence for the establishment of a metaphysical substance (svabhava). This has not yet been achieved. Thus, according to Nagarjuna, what still remains to be proved (sadhya) is the thesis regarding "substance" rather than "mutual dependence."

These two verses are very significant in that they seem to admit that the Madhyamikas have a positive thesis,
namely, "dependent arising" which is accepted on the basis of experience. The "emptiness" (sunyata) they advocate is simply a challenge for the metaphysician to prove his own metaphysics. The two verses are identical except for the use of the two pairs of terms, vigraha and parihara in the former, and vyakhyana and upalambha in the latter. As is well known, Nagarjuna is also the author of a treatise called Vigrahavyavartani. The term vigraha means "analysis." On the basis of this work, modern interpreters of Nagarjuna have assumed that he was merely an analytical philosopher whose enterprise was confined solely to "analysis" (vigraha) of opposing views utilizing the conception of "emptiness" (sunyata). However, IV.9, cast in the same mould as IV.8, raises doubts about the validity of such an interpretation of the character of Nagarjuna's philosophical method. The use of the term vyakhyana meaning "explanation" seems to indicate that, in addition to "analysis in terms of emptiness," Nagarjuna was also providing an "explanation." That explanation is once again said to be based upon emptiness (sunyataya vyakhyane krte). But as mentioned above, the term "emptiness" did not occur at all in the chapter. Instead the explanation was provided on the basis of "dependent arising" (prati tyasamutpada). "Emptiness" being the counterpart of "dependent arising," "explanation in terms of dependent arising" would, therefore, be the same as "explanation in terms of emptiness."

Thus, Nagarjuna, even when presenting his positive theory of "dependent arising," need not worry about someone censuring him, for the theory of "dependence," like "emptiness," was intended to reject the metaphysics of substance, and the responsibility once again falls on his opponent to prove his own substantiometaphysics.

**GARFIELD COMMENTARY**

9. In these last two oft-quoted verses, Nāgārjuna claims that once a demonstration of the emptiness of a phenomenon or class of phenomena has been produced, any reply will inevitably beg the question. And this is meant to have been demonstrated by the argument in this chapter in the following way: Once we have shown something to be empty of inherent existence, we have, ipso facto, shown it to be dependently arisen and merely conventionally real. Anything an opponent would want to demonstrate to be inherently existent would fall prey to the causal paradoxes developed in this chapter. That is, he must either assume that the thing is completely independent and causeless, which is, upon analysis, exactly equivalent to the conclusion he is out to prove, or that it arises from another inherently existent phenomenon. But then in order to demonstrate that fact, he must demonstrate the inherent existence of that second phenomenon (as well as the inherent dependence relation between them - a kind of relation we have seen to be internally contradictory). And this is true no matter to which ontological category the putatively inherently existent phenomenon belongs. That this is so should not be surprising, for the central thrust of Nāgārjuna’s arguments thus far, and throughout Mula-madhyamaka-kārikā, is not that inherent existence is a property some things might have had but by global accident is uninstantiated or that emptiness just happens to characterize all phenomena. Rather he is arguing that inherent existence is simply an incoherent notion and that emptiness is the only possible analysis of existence. It would follow straightforwardly that arguments for inherent existence will be question begging. (fn 48. Kalupahana (1986), p. 145, sees a different question being begged. He writes: “The argument in favor of dependence is experience. Hence, the person presenting a refutation of this idea should be in a position not only to negate ‘mutual dependence’ but also to provide evidence for the establishment of a metaphysical substance (svabhāva). This has not yet been achieved. Thus, according to Nāgārjuna, what still remains to be proved is the thesis regarding ‘substance’ rather than mutual dependence.” While this analysis is consistent with Kalupahana’s interpretation of Nāgārjuna as a pragmatically inclined empiricist, I do not see it as an accurate rendering of the argument here. In particular, it ignores the emphasis on emptiness in these verses.)
Chapter V

Chapter V: Examination of Elements
CHAPTER COMMENTARIES, SUMMARIES, OUTLINES

Chapter V
MAJBA (TOPICAL OUTLINE)

OUTLINE:
We are still in the section of the text explaining that the three kinds of phenomena are selfless. We have completed the first two parts—the refutation of the phenomenal self of the faculties and the refutation of the phenomenal self of the aggregates—and we now turn to the third part: the refutation of the self of phenomena with respect to the elements. [134:5] This chapter constitutes the third part.
EXPLANATION:

Here, one might say that since the elements have not been refuted, and since the Transcendent Lord has said, “Great Emperor, this person comprises six elements,” Pitaputra-samagama-sutra, dKon brtsegs nga 127 b], and thus demonstrated the six elements—earth, water, air, fire, space, and consciousness—and their characteristics—solidity, liquidity, mobility, heat, unobstructedness, and awareness—that without essence, the presentation of the characteristics does not make sense. Therefore, since the characteristics exist, the elements exist essentially. And so, just as do the elements, the senses and other faculties exist essentially.

If indeed the elements existed essentially, the other two could also exist in the same manner, but they do not exist essentially. In what way do they not? This section has two parts: the refutation of the essential existence of the six elements and condemning the extreme views of reification and nihilism.

SUMMARY:

One should ascertain the meaning established by these arguments to be that with respect to the elements, if characteristic and characterized and existence and nonexistence of entity as they are presented by the sutras existed inherently, instead of being merely posited through the force of nominal conventions, then characteristic and characterized cannot be posited. Having ascertained that meaning, one should then ascertain the meanings of the two truths in the following, completely adequate way: Only insofar as they are posited merely through nominal convention are characteristic and characterized and the existence and nonexistence of entities possible.

CHAPTER V - Examination of the Dhatus

In this chapter Nagarjuna considers the nature of true knowledge of the six realms or "elements" (dhatu), i.e., bhu (earth), jala (water), tejas (fire), anila (wind), akasa (space) and vijnana (consciousness). As in previous chapters he treats only one of the elements, this time the akasa, and demonstrates how it cannot exist in four respects. That is to say, akasa cannot exist as (1) an entity or existence (bhava), (2) a non-entity or non-existence (abhava), (3) a characterization (laksya), and (4) a characteristic (laksana). These four aspects are applicable to the other five dhatu. In the last verse Nagarjuna comes out with the truth of things in the Madhyamika sense that one who indulges in the conceptualization of nature’s elements, e.g., into existence and non-existence, will never arrive at their real perception or understanding.

INADA (Chapter Introductions)

5. Elements (dhatu). In the early Buddhist tradition, the psychophysical personality was analysed into five aggregates (skandha) in order to show that there was no permanent spiritual entity or self (atman) as recognized by the traditional Indian philosophers. Therefore, the psychic pan of the personality was analysed in detail. In order to refute the view of the Materialists that the eternal entity is matter, not a spiritual or psychic entity, the Buddha once again analysed the human personality into six elements (dhatu) with a detailed examination of the physical pan of the personality. Thus we have the category of elements consisting of earth (prthvi), water (apas), fire (tejas), air (vayu), space (akasa) and consciousness (vijnana).

While the conception of a “unique cause” (karana) was introduced in the examination of the aggregates (skandha), the notion of “characteristics” (laksana) is brought into the analysis of elements (dhatu). Though the term “characteristic” (Pail lakkhana) occurs in the early discourses, there it is not used in the metaphysical sense in which it came to be employed by the Sarvastivada school. For the Sarvastivada, a characteristic (laksana) represented the changing aspect of an entity (dharma), while self-nature (svabhava) stood for the unchanging and eternal aspect.

KALUPAHANA (CHAPTER OVERVIEWS)

This particular notion of “characteristic” needs to be kept in mind when analysing the contents of Chapter V.

A “characteristic” is evaluated here in relation to an existent (bhava) which possesses self-nature (svabhava). For the Sarvastivadins, this existent was a dharma. Hence, very often we find Kumarajiva utilizing the term fa (= dharma), in its restricted sense, to render bhava (yu), which is an indication that he too was aware of the nature of the concept analysed by Nagarjuna. Nagarjuna’s major endeavor here is to demonstrate the difficulties that arise when speaking of characteristics (laksana) in relation to eternal or absolute existence (bhava) as well as nihilistic non-existence (abhava).

This analysis becomes all the more important because of the way bhava and abhava are treated here. Nagarjuna’s conclusion is significant: “Those people of little intelligence who perceive the existence (astitva) as well as the nonexistence (nastitva) of existents (bhava) do not perceive the peaceful appeasement of the object (drastavya)” (V.8).

In the Buddhist texts, including the Karika, we read more often about the appeasement of obsession
However, for the first time, Nagarjuna introduces the notion of the appeasement of the “object” (drastavyopasama). Why?

It was mentioned earlier that the Buddha’s discourse on the aggregates (skandha) was intended to refute the notion of a spiritual self (atman) and the discourse on elements (dhatu) was meant to reject the notion of a material self or eternal matter. If this supposition is correct, we have no difficulty in understanding the reasons for Nagarjuna’s introduction of the idea of appeasing the object. The objects of perception associated with the first five sense faculties are material. If the Materialists were looking for a self (atman) in matter and the Sarvastivadins were looking for a self-nature (svabhava) in the same, the best advice a non-substantialist like Nagarjuna could give such people is to “vaporize or liquify” the object, and avoid grasping after it. For Nagarjuna, there was no difference between self (atman) and self-nature (svabhava). While they carry the same philosophical implications, their practical consequences are also similar, in that both lead to grasping and, therefore, suffering. Abandoning grasping (upadana) for the object, one eliminates the metaphysical beliefs pertaining to eternal existence (astitva) and nihilistic nonexistence (nastatva). Hence the emphasis on the appeasement of the object. Indeed, “the appeasement of the object” (drastavyopasama) is the means by which one can realize the “non-substantiality of phenomena” (dharma-nairatmya) and it does not mean the elimination of the object.

Unless one were to keep in mind this particular context in which Nagarjuna was emphasizing the “appeasement of the object,” it would be easy to assume that here Nagarjuna was justifying idealism (vijnanavada). Candrakirti’s comments, unfortunately, lead to such unwarranted conclusions.75

---

**BATCHelor (POETIC “TRANSLATION”)**

Space

No trace of space
Is there before
The absence of obstruction
Which describes it.

With no obstruction,
How can there be
Absence of obstruction?
Who distinguishes between them?

Space is not obstruction

Or an absence of it,
Nor is it a description
Or something to describe.

Fluidity and heat,
Energy and gravity
Are just like space.

In seeing things
To be or not to be
Fools fail to see
A world at ease.

---

**JONES (COMMENTARY)**

5. The Five Elements

Buddhists adopted the traditional Indic “physics” of earth, water, fire, and wind (e.g. Samyutta Nikaya II.94), adding space as a fifth element later (Sakadata 1997: 21-25). These four elements are not the earth, water, fire, and air we actually experience in the everyday world: they are invisible elements constituting all that we see. Akira Sakadata likens them to energy (ibid., 21-22). In traditional Buddhist metaphysics, space and nirvana are considered unconditioned and cannot affect anything. Nagarjuna does not directly tackle that issue. He instead applies his standard analysis in terms of self-existent entities and properties. Nothing suggests that he saw space as in any way different from the other elements.

The “defining characteristic (lakshana)” is not any possible characteristic, but the one essential to a phenomenon. Of course, this depends on how something is defined: what is the essential characteristic of ice - its hardness or that it is composed of water? Nothing exists without a defining characteristic (v. 2). So if we think of the characteristic as something existing distinct from the entity that embodies it, where could it exist? The entity already has the characteristic. Verse 5 draws the conclusion that no real (self-existent) entity or real characteristic is found.

In verse 6, “nonexistence (abhava)” does not mean nonexistence or nothingness in the usual sense. Rather it is the absence of an existing entity (bhava). Thus, without bhavas, there can be no abhavas, and if bhavas are not real (self-existent) than neither are abhavas.

Nagarjuna concludes in verse 8 that those “who see in terms of the ‘is-ness’ and ‘not-is-ness’ of entities, do not
perceive the peaceful stilling of what can be seen.” It is not merely a matter of adopting a new metaphysical claim, but of actually seeing things differently. When we are free of a sense of eternal, permanent self-existent entities, there is the “stilling of what can be seen” in the sense that we no longer project our conceptual categories onto reality; thereby, we no longer create a false world of discrete, self-existent entities.

But this does not mean that sense-awareness goes blank or that the phenomenal world disappears. It is a “stilling” of a sense of distinct objects, not of what is really there (tattva). The idea that whatever is dependently arisen is “still” or “peaceful” and thus free of any multiplicity suggested by our conceptualizing occurs throughout the Karikas (e.g., 7.16).

GYAMTSO (COMMENTARY)

5

An Examination of the Elements

In the Prajnaparamita Sutras, the Buddha taught:

*The element of earth has no nature of its own.*

This is THE ONLY LINE that Mipham Rinpoche quotes in the commentary; in the sutras the Buddha made similar statements about the other elements (dhatus)—water, fire, wind, space, and consciousness—and thus he explained the emptiness of the elements in a vast way. In this chapter, Nagarjuna proves the validity of these teachings with logical reasoning.

Those who believed that things actually exist claimed that since the Buddha taught about the elements and their characteristics, they must in fact exist. Furthermore, since the sources of consciousness and the aggregates are all included within the elements, then they must exist as well. Since the reason these people had for believing in the reality of things was that they believed in the true existence of the elements, it was therefore necessary for Nagarjuna to examine the elements and demonstrate that they are not truly existent at all.

The first verse from this chapter reads:

Space can in no way exist
Prior to its defining characteristics.
If space existed prior to its defining characteristics,
It would follow that space could exist without defining characteristics.

When Nagarjuna analyzed the sources of consciousness, he refuted their existence from the perspective of the relationship between perceiving subjects and perceived objects. When he examined the aggregates, he refuted their existence from the perspective of the relationship between causes and results. Here, when he analyzes the elements, it is from the perspective of the relationship between the defining characteristics of something, or the basis to which a particular name is given, and the definiendum, that which is defined by those characteristics, the name that is given to that basis. This chapter will show that this relationship too cannot be a truly existent one.

Here Nagarjuna examines space, which except for consciousness is the subtlest element. Space is the name, the definiendum, that which is defined. Space’s defining characteristics are that it does not obscure or obstruct, meaning that it is a complete absence of existence; it is thoroughly intangible. That is how space is defined.

If space and its defining characteristics truly existed, they would have to exist either sequentially or simultaneously. If they existed sequentially, then the first possibility would be that space, the definiendum, existed before the characteristics that define it. That would be impossible, however, because how could the thing that is being defined exist before there are any characteristics to define it? If it did, then space would exist without its defining characteristics. There would be space without any qualities of unobstructedness or lack of obstruction.

It would also be impossible for the defining characteristics to exist before the definiendum did, for how could there be defining characteristics if there was nothing that they defined? Defining characteristics have to be the defining characteristics of something in order to exist, and therefore the defining characteristics cannot exist before the phenomenon that they define does.

Nor can the defining characteristics and the definiendum exist simultaneously. If they did, and they truly existed independently, then there would be no connection between them. They would be like a cow and a horse: They would be independent entities that would not have any relationship with each other. This is not how it is with the defining characteristics and the definiendum, however. There has to be some connection between them, because each one depends upon the other for its existence. If they existed simultaneously as independent entities, then they would not be dependent upon each other, and therefore each would exist without a cause.

We need to understand what it means to say that something truly exists. What characteristics would something need to have in order to be truly existent? It would have to exist independently, with its own inherent nature; it would have to exist without depending on anything else and be impervious to causes and conditions acting upon it. If it were like that, then we could say it was real.

However, for there to be characteristics of something depends upon there being something to have those characteristics, and vice versa; for there to be defining
characteristics there must be a definiendum, and vice versa. In this case the characteristics of space exist in dependence upon there being some space to possess the characteristics; but also, the space can exist only when it has some characteristics to define it. Since each of them has to depend upon the other to exist, they have no nature of their own; they do not truly exist.

This is the logical reasoning that dispels any belief that space and its defining characteristics are truly existent. Does that mean, though, that they are completely nonexistent? No, it does not. There still is a dependently arisen appearance of space and of all of the elements, just like when they appear in dreams, just like the appearance of a water-moon. So we have no need to worry or be frightened, because the conclusion is not that the elements are completely nonexistent. It would be a big problem if space were nonexistent, because then we could not fly in airplanes! There is, in fact, a mere appearance of space that is the union of dependent arising and emptiness.

There are many reasonings in this chapter, but the verse that sums them all up is the seventh:

*Therefore, space is not something, it is not nothing,*

*It is not a basis for characteristics, its defining characteristics do not exist,*

*And the other five elements are precisely the same.*

We should examine all the other elements and their respective characteristics in the same way that we have examined space. This will be easy, because we apply the same analysis we have used before. It is just like when a new style of clothes comes out: Once someone has made the clothes in white, it is easy to copy the same pattern in red, blue, green, or any other color! So, in the same way that we have looked at space, we should look at earth and its characteristics of being clear and aware. By analyzing them in that way, we will see that none of them truly exists. In every case, it is impossible for either the defining characteristics or the definiendum to exist before the other; it is impossible for them to exist simultaneously; and there is no other alternative for how they could be. Therefore, they are all empty of their own essence; they all lack true existence.

At the level of thorough analysis, the true nature of space and its defining characteristics is found to be the freedom from all conceptual fabrications. We cannot say that they are something, because when we analyze we cannot find anything there; nor can we say that they are nothing, because there is the mere appearance of them that arises due to causes and conditions. Therefore, they are the union of appearance and emptiness, whose nature is beyond all of our concepts of what it might be. The same is true for all the other elements as well.

In the eighth and last verse in the chapter, Nagarjuna comments on this further:

*Those with little intelligence*

*View things as being existent or nonexistent.*

*They do not see that what is to be seen*  

*Is perfect and utter peace.*

When we do not have much understanding of reality, we either think that things exist, meaning that they are real, or we think they do not exist, that there is absolutely nothing, not even a mere appearance. These views of existence and nonexistence obscure our realization of the true nature of reality. The true nature of reality is peace, in the sense that no conceptual fabrication can accurately describe it. It cannot be said to be either existent or nonexistent. Within it, all conceptual fabrications are perfectly at peace. If we put this in the form of a logical reasoning, we would say: Those with little intelligence do not see pure reality free from the fabrications of existence and nonexistence, because they think either that things exist or that they do not. They think either that there is something truly there or that there is nothing there at all. They do not realize that appearances are mere dependently arisen appearances, and so they cannot see the true nature of reality beyond fabrication. On the other hand, those who have great intelligence are able to transcend the fabrications of existence and nonexistence and see pure reality. They do not have the view of existence—they do not think things are real—nor do they have the view of nonexistence, which would be to think that there is absolutely nothing. They perfectly understand the union of appearance and emptiness, of dependent arising and emptiness, and this frees them from extreme views. They would not even claim to abide in the “middle” in between the extremes, because if the extremes do not exist, how could there be any middle in between them?

As the Buddha said in the King of Samadhi Sutra:

"Existence" and "nonexistence" are both extremes,  
"Pure" and "impure" are the same.  
Therefore, abandoning all extremes,  
The wise do not even abide in the middle.

The wise are completely free from all concepts about the true nature of reality, including concepts of the extremes and even concepts of some middle ground in between the extremes.

5/0 Question: The six elements all have their fixed characteristics. It is because they have these fixed characteristics that they are the six elements.

Reply.

CANDRAKĪRTI COMMENTARY

[Chapter VII]

Someone may object that the primal elements (dhatu) exist because they have not been disproved. And the illustrious one said, ‘The individual person, o great king, consists of the six primal elements.’

Therefore, because of this scriptural pronouncement, even as the primal elements exist, so do the constitutive factors of personal existence and the bases of cognition (ayatana).

We reply that the factors of personal existence and the bases of cognition would exist if the primal elements did. Nagarjuna explains how that is.

Character and characteristic unintelligible

KALUPAHANA COMMENTARY

Chapter Five The Examination of Elements (Dhatupariksa)

GARFIELD COMMENTARY

Chapter V Examination of Elements

This chapter examines the ontological status of characteristics and the characterized, or in more familiar terms, properties and individuals. The question, as always, is this: Does it make sense to think of either as existing independently, substantially, or fundamentally? Or, on the other hand, are they mutually interdependent and therefore empty? The example Nāgārjuna chooses to focus on is space since it is one of the six primal elements according to classical Buddhist cosmology. (fn 49. The others are earth, water, fire, air, and consciousness.) If he can show that these elements must be understood as neither inherently existing entities nor as inherently existing characteristics of entities, he will have shown that no ontological decomposition of phenomena into their primary constituents yields inherently existing constituents. Moreover, according to some early Buddhist schools, each of the primal elements has a distinguishing characteristic and, hence, an essence. So, Nāgārjuna is addressing his opponent on the opponent’s home turf. If any entities or characteristics have essences, these do.

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 1 - Prior to any spatial characteristics, space cannot exist.
If it can exist prior to any characteristics, then, necessarily, it falls into the error of (imputing) a space without characteristics.

JONES (Skt):
[i] No space is seen prior to the defining characteristics of space - if space existed prior to its characteristics, then it would follow that it exists without its characteristics.

KALUPAHANA (Skt):
No space is evident prior to the spatial characteristics. If it exists prior to the characteristics, then it would follow that it is without characteristics.

MCCAGNEY (Skt):
Space does not occur prior to some characteristic of space. If it would exist prior to having a characteristic, it follows that there would be space without a characteristic.

NISHIJIMA (Skt?)
1. The space hasn’t been recognized at first.
And before that time, the space has been seen as it was looked at. Therefore without knowing the characteristics, the common scenery might have been passing.
Before that time the characteristics of the space might not be seen before its original condition.

SPRUNG (Skt):
1 There is no space which exists prior to its distinguishing characteristic; if it existed prior to its distinguishing characteristic it would follow that it was without character.

STRENG (Skt):
1. Space does not exist at all before the defining characteristic of space (ākāsa-lakṣaṇa). If it would exist before the defining characteristic, then one must falsely conclude that there would be something without a defining characteristic.

WESTERHOFF (Skt):
V.1 No space is evident prior to the characteristic (laksana) of space. If it existed prior to the characteristic, it would follow that it was without the characteristic.

ROBINSON (Skt):
No space occurs previous to the mark of space; if it were previous to its mark, the absurdity would ensue that it is markless.

BOCKING (Ch):
5v1 Before there was the characteristic of space
There was no dharma of space
If space had been pre-existent
Then it would have been without characteristics.

BATCHelor (Tb):
Not the slightest bit of space exists prior to the characteristics of space. If [space] existed prior to its characteristics, it would follow that it would be without characteristics.

DOCTOR (Tb):
Before the characteristics of space, There is no space whatsoever.
If it existed before its characteristics, It would follow that it has no characteristics. [V.1]

GARFIELD (Tb):
1. Prior to a characteristic of space
There is not the slightest space.
If it arose prior to the characteristic
Then it would, absurdly, arise without a characteristic.

GARFIELD-SAMTEN (Tb):
1. Prior to a characteristic of space
There is not the slightest space.
If it existed prior to the characteristic
Then it would, absurdly, exist without a characteristic.
HAGEN (paraphrase):
5.1 Space is not evident prior to the characteristics of space. If space existed before spatial characteristics, then it would be without characteristics.

GOLDFIELD (Tb):
Space can in no way exist prior to its defining characteristics. If space existed prior to its defining characteristics, it would follow that space could exist without defining characteristics. (1)

PINGALA COMMENTARY

5/1 If the dharma of space had existed before there were the characteristics of space, space would have been without characteristics, and why? What we mean by the characteristic of space is 'a place without form'. Form is something created and impermanent. Before forms arise, not yet having arisen they do not cease, thus at that time there is no characteristic of space. It is only because there is form that there are places without form. To be a place without form is what is meant by the characteristic of space.

Question: What is wrong in saying that there is space without characteristics?

CANDRAKĪRTI COMMENTARY

The six primal elements referred to in the scriptural quotation are: earth, water, fire, air, space (akasa) and consciousness. The stanza, using space as a paradigm, shows the vitiating difficulty of understanding them as self-existent natures. Openness (anavarana) is commonly taken to be the distinguishing characteristic (laksana) (fn 1 The problem is both logical and ontological. Some Buddhists, specifically the Vaibhasika school, held that the elements of existence were a small number of irreducible reals, dharmas, which persisted through all time in their proper natures, even when they were not actual.) of space. Prior to its characteristic, openness, space could not be something characterized (laksya) because it could not be such before its characteristic was actual: before openness characterized it.

If it is so that, ‘There is no space which exists prior to its distinguishing characteristic; if it existed prior to its distinguishing characteristic it would follow that it was without character’ then let space be actual without its distinguishing characteristic. But such a thing, like a flower in the sky, cannot be. ‘There is no space .. ’

Nagarjuna says:

KALUPAHANA COMMENTARY

As pointed out earlier, the categories of aggregates, spheres, and elements constituted an important part of the Buddha's teachings as well as of the Abhidharma analysis (III. 1). This early classification was intended to account for the human personality (skandha), its experience (12 ayatanas = 6 indriyas and 6 visayas) and finally the elements to which this whole experience can be analysed (18 elements = 6 ayatanas, 6 visayas and 6 forms of consciousness). However, Nagarjuna does not take them in that particular order. This is because of the problems created by the interpreters of the Abhidharma. They were more concerned with defining each one of the elements in each of the categories without considering them in the light of other elements within the category to which it belongs or in terms of other categories outside of themselves. This led to a wide range of metaphysical speculations. For example, one of the elements (dhatu) that caused much misunderstanding and led to many metaphysical ideas is the conception of "space" (akasa). Although "space" is not an item included among either the aggregates, spheres or elements (in the earlier classification), it indeed was part of an analysis of the human personality comparable to the analysis into five aggregates (skandha). The counterpart of the skandha-classification is the explanation of the human personality in terms of six elements (cha-dhatu or sad-dhatu), one of which was "space" (akasa) (M 3.239). At S 2.150, the Buddha specifically recognized the interdependence of material form and "the sphere of space" (Yayam... akasancayatanadhatu ayam dhatu rupam paticca pannayati). However, the Buddhist metaphysicians, treating each one of the categories and items independently, assumed that "space" is "unconditioned" (asamskrtam, Akb), the latter being understood as "independence" (see Sakv; DhsA). Thus, space came to possess the unique nature of "non-
obstruction" (anavarana-svabhavam akasam) where material form finds its locale (yatra rupasya gatih, Akb).

This, indeed, was a very absolutistic conception of space, a conception that muddled up the entire Buddhist epistemology. It posed the most significant challenge for Nagarjuna. In order to eliminate such metaphysics, Nagarjuna adopted the ingenious method of analysing the source of knowledge (i.e., seeing, darsana, Chapter III), the object of knowledge (i.e., material form, rupa, Chapter IV) and its locale (i.e, space, akasa, Chapter V) and this he did on the pretext of examining the Buddha's own categories of aggregates, spheres and elements (skandha-ayatana-dhatu). Thus, the present chapter on the examination of elements comes to be devoted not to the traditional category of elements, but rather to the conception of space, highlighting its relativity, especially to material form, discussed in the previous chapter. With these three chapters, Nagarjuna was thus able to give a rather comprehensive account of the problem of knowledge.

Here there is no denial of space, but only the rejection of a particular way of understanding or conceiving it. If space were to be understood as the ultimately real pure entity, a substance to which various characteristics are attributed, in which case space precedes the characteristics, then Nagarjuna finds no epistemological justification for it. This is a criticism of the first aspect of the metaphysical explanation of space referred to above, namely, that space has the character of non-obstructon (anavarana-svabhava). The obstruction, in this case, refers to material form (i.e., pratigha).

**GARFIELD COMMENTARY**

1. (“Prior to a characteristic” fn 50. The sense of “characteristic” (misan nyid) is that of a distinguishing characteristic, or a characteristic mark or signature of a thing. I therefore use the singular here. (I owe this suggestion to the Yen. Gareth Sparham.) But the points that Nāgārjuna makes are perfectly general and could as well be made using “characteristics,” as Inada (1970) and Kalupahana (1986) do.)

Space cannot exist as a completely uncharacterized entity that then somehow acquires characteristics. Anything that exists has some properties and cannot be identified or characterized independently of them.

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 2 - Nowhere is there any entity without characteristics. When there is no entity without characteristics, where could the characteristics appear?

JONES (Skt):
[2] And there is no entity anywhere at all without characteristics. When an entity without characteristics does not exist, where can characteristics appear?

KALUPAHANA (Skt):
An existent that is without characteristics is nowhere evident. When an existent without characteristics does not exist, where can characteristics appear?

MCCAGNEY (Skt):
Not any existent without a characteristic is found anywhere. Where a being without a characteristic does not exist, where does that characteristic appear?

NISHIJIMA (Skt?):
2. When there is no phenomenon at all, A concept of existence can be recognized a little.
When there is nothing in phenomenon, and when there is nothing in existence,
Just to go ahead is the aim of going, and where the aim itself is?

SPRUNG (Skt):
2 No thing whatsoever can be actual anywhere lacking its distinguishing characteristic. As a thing lacking a distinguishing characteristic does not exist to what would a distinguishing characteristic be applied?

STRENG (Skt):
2. In no case has anything existed without a defining characteristic. If an entity without a defining characteristic does not exist, to what does the defining characteristic apply?

WESTERHOFF (Skt):
V.2a An object without characteristics is not to be found anywhere…

ROBINSON (Skt):
No markless existent occurs anywhere; when no markless existent exists, to what could the mark go?
PINGALA COMMENTARY

5/2 If you search for dharmas without characteristics amongst either permanent or impermanent dharmas you will not find any. It is as the authors say; "How do we know that 'This exists' and 'This does not exist'? Because each entity has its own characteristics". Arising, abiding and ceasing are the characteristics of active (things) and non-arising, non-abiding and non-ceasing are the characteristics of the inactive. If space had no characteristics, it would not be space. Nor is it correct to say that it previously had no characteristics, but subsequently its characteristics manifested as characteristics. If it had no characteristics before, then there was no dharma to be characterized, and why?

CANDRAKĪRTI COMMENTARY

2ab No thing whatsoever can be actual anywhere lacking its distinguishing characteristic.

You may interject that a distinguishing characteristic could be actual (pravṛttī) only in something characterized and as this actual characteristic is a fact (sadbhavat) what is characterized must exist as well. But this is not so either. Because

2cd As a thing lacking a distinguishing characteristic does not exist to what would a distinguishing characteristic be applied?

It was said that no thing (bhava) has characteristics. This discussion can be read as an attack on the possibility of eternal dharmas unrealized in time and space; or as an attack on the realist (common sense) conception of the nature of ‘things’ in time and space.) lacking a distinguishing characteristic can exist prior to its distinguishing characteristic. It follows that the distinguishing characteristic cannot be actualized. How can a distinguishing characteristic become actual in something which is not, which in no way at all exists, which is without distinguishing characteristic, which is quite lacking in distinguishing characteristic? Further, this actualized distinguishing characteristic would be actual either in something with or in something without a distinguishing characteristic. Nagarjuna says that neither alternative is intelligible:

KALUPAHANA COMMENTARY

The denial of pure "space" at V. 1 is here extended to all elements or entities (bhava). The question that follows next is: If there were to be no pure entity or a tabula rasa, then one also cannot account for adventitious elements through which something comes to be known. This represents the second aspect of the metaphysical definition mentioned earlier, namely, the "unobstructed space" serving as the locale for the appearance of material form (yatra rupasya gatih = rupasyaa kramatam).

GARFIELD COMMENTARY

2. So we can conclude that everything has characteristics. But maybe these characteristics exist inherently, independently of the things, and then come to be associated with them. On such a view, while individuals would not have inherent existence, properties would.
Kārikā V.3

ENGLISH TRANSLATIONS  

INADA (Skt):  
Verse 3 - In instances of either with or without characteristics,  
there is no production of characteristics. Again, there is no  
production in another place other than the two (i.e., with  
and without characteristics).  

JONES (Skt):  
[3] Characteristics do not appear in what is without  
characteristics, nor in what already has characteristics, nor  
in anything other than what is either with or without  
characteristics.  

KALUPAHANA (Skt):  
The occurrence of a characteristic does not take place  
either in something without characteristic or in  
something with characteristic. Nor does it proceed from  
something other than those with or without  
characteristic.  

MCCAGNEY (Skt):  
A characteristic appears not in what has a characteristic nor  
in what does not have a characteristic.  
Nor is it set in motion from any (existent) other than what  
neither has nor does not have a characteristic.  

NISHIJIMA (Skt?):  
3. Not in the place, where there is no good indication, or belonging  
to a good selection,  
A behavior only to go ahead without good selection, does not  
belong to a real omen itself.  
Even in the case of good selection, or bad selection,  
It is not completely different from a selection, which you are  
selecting now.  

SPRUNG (Skt):  
3 A distinguishing characteristic can be actualized  
neither in something without that distinguishing  
characteristic nor in something with it. Nor does the  
characteristic become actual otherwise than in  
something which either has or does not have it.  

STRENG (Skt):  
3. There is no functioning of a defining characteristic in a  
case where there is already a defining characteristic  
or where there is not a defining characteristic. And it  
can in nothing except where there is a  
defining characteristic or where there is not a defining  
characteristic.  

WESTERHOFF (Skt):  
V.3 The occurrence of a characteristic is neither in the  
uncharacterized nor in the characterized. It does not  
proceed from something other than those with or without  
characteristics.  

ROBINSON (Skt):  
There is no emergence of the mark in the markless or in the  
markful; neither does it emerge anywhere other than in  
the markless and in the markful.  

BOCKING (Ch):  
5v3 Whether 'having characteristics' or 'not having  
characteristics'  
No characteristic has any place in which to reside.  
Nor does it reside in any other place  
Apart from 'having characteristics' or 'not having  
characteristics'.  

BATECHELOR (Tb):  
Characteristics do not extend to that which has no  
characteristics; nor to what possesses characteristics.  
They also cannot extend to something other than what  
either possesses or does not have characteristics.  

DOCTOR (Tb):  
Characteristics do not apply to what has them,  
Nor do they apply to what does not.  
Neither do characteristics apply to something  
Other than what does or does not have them. [V.3]  

GARFIELD (Tb):  
3. Neither in the uncharacterized nor in the characterized  
Does a characteristic arise.  
Nor does it arise  
In something different from these two.  

GARFIELD-SAMTEN (Tb):  
3. Characteristics do not characterize the uncharacterized.  
Nor do they characterize the characterized.  
Nor do they characterize anything other  
Than the characterized and the uncharacterized.
HAGEN (paraphrase):
5.3 Characteristics occur neither in things with
characteristics, in things without characteristics, nor
in something other than these two.

PINGALA COMMENTARY

5/3 For example, having a hump, horns, hair at the end
of the tail and a dewlap hanging below the neck, are called
the characteristics of a cow, and apart from these
characteristics there is no cow. If there were no cow, there
would be nowhere for these various attributes to reside.
This is why we say that characteristics have nowhere to
manifest in an entity with no characteristics. In things
which have characteristics, too, there is nowhere for
(further) characteristics to reside, because the
characteristics are already existent. As an example, the
characteristics of fire do not reside in the characteristics of
water, because water already has its own characteristics.

Moreover, if characteristics were to abide in (a thing)
without characteristics, then it would be uncaused, and
something which is uncaused is not regarded as a dharma.
That which has characteristics, the characteristics, and
characterization, are always mutually interdependent, and
there is no further third state of characterization apart from
da dharma either having characteristics or not having
characteristics. This is why it says in the verse (v3) "nor
does it reside in any other place apart from having
characteristics or not having characteristics".

Further.

CANDRAKĪRTI COMMENTARY

In the one case no distinguishing characteristic can
be actualized in something lacking that distinguishing
characteristic, as it would be like a donkey’s horns. In
the other case the actualizing of a distinguishing
characteristic is something which is already so
characterized is unintelligible because pointless. What
would be the purpose of a characteristic becoming
actual once more in something known to possess that
characteristic? That would lead to an infinite regress.
But such a thing would never be without a
distinguishing characteristic, from which it would
follow that the actualized characteristic was
permanent, but this is not desirable. Hence it is
unintelligible that a distinguishing characteristic
should become actual in something which possesses
that characteristic: it would be pointless.

Again there could be the view that the characteristic
becomes actual otherwise than in something which
either has or does not have the characteristic already.
Nagarjuna says, ‘Nor does the characteristic become
actual otherwise than in something which either has or
does not have it.’

Why is this? Because such a thing does not exist. If
something possesses a characteristic it is not without it
and if it is without a characteristic it does not possess
it. So, to ‘possess a characteristic’ and ‘not to possess it’
are contradictory (vipra-tisiddha). But what is
contradictory cannot be (na sambhavati). For this reason,
precisely because it is simply impossible, Nagarjuna
says it is unintelligible that a characteristic could
become actual either in something that possesses it or
in something that does not.

Again one might think that, even though
characteristics cannot be actual, none the less the
subject of characterization (laksya) exists. But this
cannot be either because

KALUPAHANA COMMENTARY

Here again, it seems inappropriate to assume that
Nagarjuna was denying either space or material form, but
only the manner in which they were explained by the
metaphysicians. It is the sharp dichotomy between a thing
and its properties that cannot account for either of them.
The substantialist mode of speaking about entities (bhava)
leads to two extremist views, namely, identity or
difference. The second statement rejects the view that the
problem of identity and difference can be solved by
transcending both. The reasoning seems to be that, rather
than attempting to solve the problem of identity and
difference by following the method of transcendence, it is
more appropriate not to create such a sharp distinction in
the first place.

GARFIELD COMMENTARY

3. But there is a problem. If a characteristic were
inherently existent, it would have to become instantiated in
either a characterized or an uncharacterized object. But there
are no uncharacterized objects, and if the object already is
characterized, there is no need for the characteristic to
become instantiated. So to think of individuals and
properties as existing independently and then somehow
coming together to constitute particulars makes no sense.
Kārikā V.4

 Verse 4 - Where characteristics do not arise, there can be no characterization. And where characterization is not possible, characteristics will not arise.

And where no characteristics occur, no entity with characteristics occurs. And where there is no occurrence of an entity with characteristics, no characteristics can arise.

When the characteristic does not occur, the characterized is not appropriate. In the absence of the characterized, there is no occurrence of the characteristic.

If neither characteristic is present, the characterized does not occur. If there is no occurrence of the characterized, there is no occurrence of the characteristic.

When some characteristics haven't appeared yet, Then the characteristics have never been recognized. When the image of characteristic is not yet recognized, The characteristic itself never exists in this world at all.

A subject of characterization is unintelligible without actual characteristics. If the subject of characterization is not established characteristics become impossible as well.

4. When there is no related function (sampravrtti) (i.e. defining process), it is not possible to have "that to which a defining characteristic applies." And if "that to which a defining characteristic applies" is not possible, then a defining characteristic cannot come into existence.

ENGLISH TRANSLATIONS

INADA (Skt):

4 A subject of characterization is unintelligible without actual characteristics. If the subject of characterization is not established characteristics become impossible as well.

STRENG (Skt):
4. When there is no related function (sampravrtti) (i.e. defining process), it is not possible to have "that to which a defining characteristic applies." And if "that to which a defining characteristic applies" is not possible, then a defining characteristic cannot come into existence.

WESTERHOFF (Skt):
V.4b In the absence of the characterized, the characteristic does also not exist.

ROBINSON (Skt):
When the mark does not emerge, the marked is not a fact; when the marked is not a fact, the mark too is impossible.

BOCKING (Ch):
5v4 Because the dharma of 'characteristic' does not exist There is likewise no dharma of 'characterization'. And because no dharma of characterization exists, No dharma of 'characteristic' exists either.

BATCHelor (Tb):
If characteristics do not extend [to something], something characterized would be impossible. If something characterized is impossible, characteristics too would not exist.

DOCTOR (Tb):
If characteristics have no application, It makes no sense that there should be bearers of them. If the bearers of characteristics are unreasonable, Their characteristics cannot exist either. [V.4]

GARFIELD (Tb):
4. If characteristics do not appear, Then it is not tenable to posit the characterized object. If the characterized object is not posited, There will be no characteristic either.

GARFIELD-SAMTEN (Tb):
4. When there is no characterization The basis of characteristics makes no sense. Since the basis of characteristics makes no sense, There is no characteristic either.

HAGEN (paraphrase):
5.4 Without any characteristics, no characterized thing can occur. When no characterized thing occurs, no characteristic occurs.
5/4 Since there is nowhere for a characteristic to reside, there is no dharma of 'characterization'. Since there is no dharma of characterization, there is no dharma of characteristic. Why is this? Because characterization exists by virtue of characteristics, and characteristics exist by virtue of characterization: the two are causally interdependent.

CANDRAKĪRTI COMMENTARY

4ab A subject of characterization is unintelligible without actual characteristics.

So long as there are no actualized characteristics how could there be something characterized? Nagarjuna means that that is completely impossible. If you interject that we have rejected as false the actualization of distinguishing characteristics but not distinguishing characteristics themselves and that therefore the subject of characterization does exist because the characteristic is a fact, Nagarjuna replies:

4cd If the subject of characterization is not established characteristics become impossible as well.

It was shown that: ‘A subject of characterization is unintelligible without actual characteristics.’ So it follows: if the subject of characterization is not established characteristics become impossible as well, because they would have no substrate (asraya). In so far as, thus, characteristics do not exist, the argument given, namely that the subject of characterization does exist because the characteristic is a fact, does not hold. This being the case, therefore

KALUPAHANA COMMENTARY

The relativity of concepts, or more specifically the contextual meaning of concepts, is here underscored. Definitions may be useful in clarifying the meaning of terms. Yet these meanings are not derived independently; they occur in contexts and, as such, any reference to substance and attribute should not be taken to imply distinct or pure referents. What are denied here are not the concepts of the characterized or of the characteristics, but merely their independent existence.

GARFIELD COMMENTARY

4. But if we were to go completely eliminativist with respect to characteristics, we would lose the ability to posit both actual objects with characteristics and characteristics that actual objects share.
Kārikā V.5

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 5 - Therefore, characterization as well as characteristics cannot exist. Again, an entity devoid of both characterization and characteristics cannot exist.

JONES (Skt):
[5] Therefore, an entity with characteristics is not found, nor are any characteristics found. In addition, no entity is seen distinct from an entity with characteristics, nor are any characteristics seen without an entity.

KALUPAHANA (Skt):
Therefore, the characterized is not evident. Neither is the characteristic evident. Distinct from the characterized and the characteristic, an existent is certainly not evident.

MCCAGNEY (Skt):
Therefore the characterized does not occur nor does the characteristic occur. Separate from the characteristic and the characterized, no existent occurs.

NISHIJIMA (Skt?):
5. Therefore it is impossible for us to recognize a characteristic itself, And it is impossible for us even to know whether any kind of characteristic really has been given, or not. About the characteristic itself, it is not clear whether it has any kind of characteristic, or not, And it is completely impossible for the characteristic to be known whether it is really existing, or not.

SPRUNG (Skt):
5 It follows that neither the subject of characterization nor distinguishing characteristics exist. Nor can anything exist except as characteristic or what is characterized.

STRENG (Skt):
5. Therefore, "that to which a defining characteristic applies" does not exist (i.e. independently); and certainly a defining characteristic itself does not exist (i.e. independently). Now, something does not exist without "that to which a defining characteristic applies" and the defining characteristic.

ROBINSON (Skt):
Therefore the marked does not occur, the mark does not occur, and neither does any existent occur apart from marked and mark.

BOCKING (Ch):
5v5 Therefore, there are no characteristics, Neither is there any characterization. And apart from characteristics and characterization. No other entity exists.

BATCHelor (Tb):
Therefore, the bearers of characteristics do not exist, And characteristics themselves have no existence either. Yet aside from bearers and characteristics There are no entities. [V.5]

DOCTOR (Tb):
Therefore, the bearers of characteristics do not exist, And characteristics themselves have no existence either. Yet aside from bearers and characteristics There are no entities. [V.5]

GARFIELD (Tb):
5. From this it follows that there is no characterized And no existing characteristic. Nor is there any entity Other than the characterized and the characteristic.

GARFIELD-SAMTEN (Tb):
5. Therefore there is no basis of characteristic Because there is no characteristic. Nor is there any entity Other than the basis of characteristic and the characteristic.

HAGEN (paraphrase):
5.5 Thus neither characterized nor characteristic are evident. Nor is any entity apart from these evident.
If you make a thorough investigation of causality from beginning to end, you will not be able to find a fixed nature for characteristics and characterization. Since neither of these two can be discovered, all dharmas are completely inexistent. All dharmas are completely comprised in these two dharmas of characteristic and characterization, with either the characteristic bringing about the characterization, or the characterization bringing about the characteristic. For example, smoke is regarded as a characteristic of fire, but on the other hand fire may be considered a characteristic of smoke.

Question. If there is no existence, then there must surely be non-existence?

Reply:

It follows that neither the subject of characterization nor distinguishing characteristics exist.

*Space neither entity nor non-entity*

This is the conclusion. Someone may interject that even though the subject of characterization and characteristics do not exist, none the less space does. As it exists as something real it must be either the subject of characterization or a characteristic. Hence, the subject of characterization and characteristics do exist. But Nagarjuna says that this makes no sense either.

Nor can anything exist except as characteristic or what is characterized.

That characteristics and what is characterized do not exist, was established previously. If these two do not exist there can be no space lacking both characteristics and something characterized as it would be like a flower in the sky.

If space does not exist as an entity (*bhava*) let it exist as a non-entity (*abhava*). But this does not hold either. Because

This is not a blanket denial of the characterized and the characteristic. Rather it is a denial of these two elements as explained at V.4, namely, as substance and attribute constituting independent entities. Therefore, one cannot find any event, any entity, any existence that is separated from the characterized and the characteristic. An existent separated from the characterized as well as the characteristic could turn out to be a "pure entity," an idea clearly unacceptable to Nagarjuna.

5. In the first two lines of this verse, Nāgārjuna draws the conclusion that there are no inherently existent characteristics and no inherently existent characterized entities. Entities and their properties are mutually dependent and, hence, empty of inherent existence. But this does not mean, he emphasizes in the final two lines, that there is some other ontology of inherently existent basic types that could replace them. Indeed particulars can be thought of as characterized entities, with characteristics; but this does not entail the independent existence of entities of either of those types.

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 6 - Where an entity is non-existent, how can any non-entity exist? Moreover, destitute of either entity or non-entity, who can ever know anything apart from these?

JONES (Skt):
[6] When an existing entity is not found, of what can there be the “absence of an entity”? And without the realities of an “entity” and an “absence of an entity,” who could be aware of an “entity-and-absence-of-an-entity”?

KALUPAHANA (Skt):
When an existent is not evident, whose non-existence can there be? Who could comprehend the distinct things: existent and non-existent as well as existence and non-existence?

MCCAGNEY (Skt):
How will there be a being where a being is not occurring? And who favors the statement “existents and nonexistents are beings and nonbeings devoid of attributes”?

NISHIJIMA (Skt?):
6. In the situation that it is not clear whether something exists really, or not, How is it possible for us to decide that it does not exist decisively? Discussion between existence and non-existence might be opposite to the Universal Rule. What is the meaning that existence and non-existence are a kind of favor?

SPRUNG (Skt):
6 If something is not at all, of what will there be nonexistence? Who would it be who enquires into existence and nonexistence contrary to the logic of existence and nonexistence?

STRENG (Skt):
6. If the existing thing (1) (bhava) does not exist, how then would the non-existing thing (2) (abhava) come into existence? And who holds: the existing-and-non-existing (3) thing which does not have the properties of an existing-and-non-existing thing (4)?

ROBINSON (Skt):
When the existent does not occur, to what would the in-existent belong? Who apart from existent and inexistential knows the existent and inexistential?

BOCKING (Ch):
5v6 If we allow that there is no existence Then how could there be non-existence? And since there would be neither existence nor non-existence,
Who would be the knower of existence or non-existence?

BATCHELOR (Tb):
If there is not a thing, of what can there be a non-thing? By whom are the opposites thing and non-thing known [as] a thing and a non-thing?

DOCTOR (Tb):
If there is no entity, Of what would there be no entity? What entity, nonentity, or otherwise Would be the knower of entity and nonentity? [V.6]

GARFIELD (Tb):
6. If there is no existent thing, Of what will there be nonexistence? Apart from existent and nonexistent things Who knows existence and nonexistence?

GARFIELD-SAMTEN (Tb):
6. If no entity exists, Of what entity would an absence be? Entities and nonentities are mutually exclusive. Who knows entities and nonentities?

HAGEN (paraphrase):
5.6 When even existents are not evident, what nonexistents are evident? Apart from these where are either existence or non-existence to be found?
PINGALA COMMENTARY

5/6 When ordinary things either decay of themselves or are destroyed by others, they are termed non-existent. Nonexistence does not exist in itself but derives its being from existence. This is why it is said, 'if we allow that there is no existence, then how could there be non–existence?' If even eyes' seeing and the ears' hearing cannot be found, how much more so 'inexistent entities?'

Question. (Granted that because existence does not exist, non–existence does not exist either, yet surely there must be a knower of existence and non existence?)

Reply. If there were such a knower, either he would have to reside in existence, or he would have to reside in nonexistence. Since existence and non–existence have already been refuted, such a knower is equally refuted.

CANDRAKĪRTI COMMENTARY

6ab If something is not at all, of what will there be nonexistence?

In so far as space does not exist as an entity, that is, there is no such thing, of what is there supposed to be non-existence? Nagarjuna will say later (XV.5) ‘If existence is not accepted, nonexistence cannot be established. Because people say that nonexistence is being other than existence.’ Hence, because it is not a something, space cannot possibly be a non-entity either.

Space is the total absence of external form (rupa) thus it is defined. Now if form existed then space could be the total absence of form. But as, according to the line of thought already developed (Chapter VI), form does not exist itself, of what would space be the absence?

Nor does the enquirer exist

Someone may interject that there is existence and non-existence as the one enquiring into them exists in fact. ‘You yourself, he might say, ‘are the one enquiring into existence and nonexistence. You are the one who says, “If something is not at all, of what will there be non-existence?”’ Hence, as the one enquiring into existence and non-existence is a living fact, existence and non-existence too as the subject of the enquiry, must be real.’ Our reply is that this makes no sense either. Because

6cd Who would it be who enquires into existence and nonexistence contrary to the logic of existence and nonexistence?

If it is accepted that there is both existence and nonexistence, then the one who inquires would be either existent or non-existent. If he is thought of as existing, the crippling difficulty already given holds: ‘Nor can anything exist except as characteristic or as what is characterized.’ If, on the other hand, he is thought of as non-existent, in this case the crippling difficulty already given is, ‘If something is not at all of what will there be non-existence?’ There is no third kind of entity which, contrary to the logic of existence and nonexistence, would be the one grasping these two. There is no enquirer into existence and non-existence.

That is why the illustrious one said, ‘Whoever comprehends things as non-things in no way clings to anything at all; whoever clings in no way to anything at all attains that state where there are no causes.’

And again: ‘Whoever thinks the elements of existence are merely empty is foolish and walks a dangerous path. Imperishable are the empty elements and yet not imperishable are the imperishable elements said to be.’

‘To think the elements of existence are at peace, utterly at peace, such a thought can never be true. The entire manifest world arises from discriminative thinking; the elements should be realized to be subtle and beyond the reach of thought.’ And so on.

Being, non-being and nirvāṇa

Now Nagarjuna, with a view to summing up what has been established, states
KALUPAHANA COMMENTARY

Here again, if we are to understand "existent" (bhava) without taking into consideration the sort of "existent" referred to at V.5, we would be left with a universal statement regarding all "existents" (bhava). Yet, it is not meant to be taken that way. The "existent" referred to here is already defined at V. 5. It is an "existent" that is separated from either the characterised or the characteristic or both. It is a "pure existent." Such a pure existent could then be contrasted with a pure non-existent, and it is this sharp distinction or dichotomy that is being questioned by Nagarjuna. Indeed, it is significant to note the use of the term vi-dharma (whose occurrence in any other text is not known to the present author) in the sense of "distinct things."

GARFIELD COMMENTARY

6. Here Nāgārjuna generalizes the conclusion and indicates its larger ontological implications. Having shown that there are no inherently existent things, it might seem that it follows that all things are inherently nonexistent. But existence and nonexistence, after all, are characteristics. So it follows that neither existence nor nonexistence can be said to exist independently and hence to characterize, inherently, anything. Moreover, since no particulars can be said inherently to exist, and thereby characterized as inherently existing things, none can be said to be inherently nonexistent. Existence and nonexistence are hence themselves dependent, relative characteristics. It is, of course, important to recall that this entire dialectic is aimed at nonrelative understandings of existence and nonexistence. Nāgārjuna is not arguing that nothing exists in any sense and that nothing fails to exist in any sense. Rather, he is arguing that nothing exists in virtue of instantiating an independently existent property of existence. Similarly, things do not fail to exist in virtue of instantiating the property nonexistence.
Kārikā V.7

Therefore, space is not an existent, not an inexistent, not something marked, and not a mark. The other five dhatus are [to be] the same as space.

Therefore, space is not a thing; it is not a non-thing; it is not a basis for characteristics, its defining characteristics do not exist, and the other five elements are precisely the same. (7)
PINGALA COMMENTARY

5/7 Just as one may search for the characteristic of space in various ways but cannot find it, so the other five elements are also the same.

Question. Space is neither the first nor the last (of the six elements), so why do you refute it first?

Reply. Earth, water, fire and wind are causally combined, and therefore easily refuted, and because consciousness is the cause of pain and pleasure it is recognized to be impermanent and changeable and thus is easily refuted. Space does not possess such characteristics, but the ordinary man imagines it to be existent, so this is why we refute it first. Moreover, space has the function of supporting the four great (elements, fire, etc.), and consciousness exists by virtue of the four great elements. Therefore we first refute the basic thing, and the others are automatically refuted.

Question. Ordinary people all see things as existent or non-existent. Why do you alone, in contradiction to the world, say that what is seen does not exist?

Reply.

CANDRAKĪRTI COMMENTARY

7ab Space is neither existent nor non-existent, nor is it something characterized nor yet a characteristic.

And

7cd The other five primal elements are exactly like space.

Earth, air, fire, water and consciousness are the remaining five primal elements. This means that they are to be clearly known as lacking, as space does, existence, non-existence, character and characteristics — a nature which is merely imputed (parikalpa) to them. Even though the true nature (svabhava) of things has thus been established, there are some who, because their mind’s vision has succumbed to the optical defect of ignorance from entanglement in the beginningless cycle of birth and death, view things falsely as existing or not existing and so on. These have fallen away from the true path of seeing things unerringly as not self-existent, the path which leads to nirvāṇa.

KALUPAHANA COMMENTARY

Thus, neither existence nor non-existence, the characterized nor the characteristic as envisaged by the metaphysicians exist. The five elements—earth, water, fire, air and consciousness, which together with space constitute the personality (cha-dhaturoyam puriso) do not exist if these elements are conceived of in the same way as space. This does not mean that the way in which the metaphysicians conceive of the six elements is the only way in which they can be understood and explained.

GARFIELD COMMENTARY

7. Nāgārjuna now returns to the example at hand to sum up the conclusions of the chapter. Things cannot be analyzed ontologically as particulars existing independently of their properties. But this does not mean that individual things do not exist. They do not possess independently existing properties. But this does not mean that things are all propertyless.

_____
INADA (Skt):  
Verse 8 - Those of low intelligence (i.e., inferior insight) who see only the existence and non-existence of things cannot perceive the wonderful quiescence of things

JONES (Skt):  
[8] Those of little intelligence, who see in terms of the “is-ness” and “not is-ness” of entities, do not perceive the peaceful stilling of what can be seen.

KALUPAHANA (Skt):  
Those who ate of little intelligence, who perceive the existence as well as the non-existence of existents, do not perceive the appeasement of the object, the auspicious.

MCCAGNEY (Skt):  
But those of inferior insight who see only the existence and nonexistence of beings do not see the emancipating cessation of appearances.

NISHIJIMA (Skt?):  
8. Reality, or those things and phenomena, are just possible to be seen by ourselves. And people, who do not affirm the real existence of this world, might have a little unclever mind in their thoughts. All things, which exist, can never be seen without fail. But what can be seen are becoming quiet, and including everything.

SPRUNG (Skt):  
8 Those who see being and non-being in things are of small mind; they do not comprehend the beatific coming to rest of the manifest world.

STRENG (Skt):  
8. But those unenlightened people who either affirm reality or non-reality Do not perceive the blessed cessation-of-appearance of existing things.

ENGLISH TRANSLATIONS

BOCKING (Ch):  
5v8 The superficial see dharmas As having the characteristics of existence or non-existence. And thus are unable to perceive The calm serenity of the cessation of views.

BATCHelor (Tb):  
Those of small minds see things as existent and non-existent. They do not behold the utter pacification of what is seen.

DOCTOR (Tb):  
The feebleminded who see Things in terms of existence and nonexistence Fail to see what is to be seen — The peace of complete pacification. [V.8]

GARFIELD (Tb):  
8. Fools and reificationists who perceive The existence and nonexistence Of objects Do not see the pacification of objectification.

GARFIELD-SAMTEN (Tb):  
8. Those fools who see entities As existent or as nonexistent Do not see that which is to be seen As pacified and peaceful.

HAGEN (paraphrase):  
5.8 The unenlightened, who see both existence and non-existence in things, do not see the coming to rest of the manifest world.

GOLDFIELD (Tb):  
Those with little intelligence View things as being existent or nonexistent. They do not see that which is to be seen Is perfect and utter peace. (8)
PINGALA COMMENTARY

5/8 When a person has not yet attained the Way, he is unable to perceive the true character of dharmas, and because of his desires and false perceptions he generates all kinds of vain arguments. Seeing a dharma as it comes into being he asserts that it is 'existent'. Clinging to its characteristics he says it exists. Seeing a dharma ceasing to exist he asserts that it is cut off, and clinging to this characteristic he says that it is inexistent. The man of insight, seeing that dharmas arise, extinguishes the view that they are nonexistent, and seeing that they cease extinguishes the view that they exist. Consequently, although there is something in regard to dharmas which he sees, it is like an illusion or a dream, so that he ceases even to hold a view of 'a Way free of outflows'. How much more so other views?

Therefore, someone who does not perceive the calm tranquility of the cessation of views, will only see things as existing or see them as not existing.

CANDRAKĪRTI COMMENTARY

The coming to rest of the visible world (drastavyopasama), which is of the nature of beatitude is free of the entire network of conceptual thinking (sarvakalpanajala); its very nature is the cessation of knowing and the known; its very nature is the beatitude of the higher truth. Those who, because of weak mind are rooted in the prejudices of being (astitva) and non-being (nastitva), cannot understand a nirvāṇa of the higher truth which does not age nor die, which is not of the realm of named-things, and whose quintessence is the absence of both being and non-being (sunyata).

As it is said in the Ratnavali, “The one who thinks “it is not” walks a difficult path; the one who does not think “it is not” walks a favourable path. The one who is freed from both attains liberation from a clear grasp of the way things really are.’

In the Samadhiraja Sutra the illustrious one says, ‘“It is”, “It is not” are two dogmas; “purity”, “impurity” are two dogmas; and so the wise man abandons both dogmas without taking up a position in the middle. “It is”, “It is not” is mere disputation; “purity”, “impurity” is mere disputation; afflicted existence is not terminated by engaging in disputation; afflicted existence is brought to an end by not engaging in disputation.’

It follows that it is utterly impossible to attain nirvāṇa by any path based on the everyday world.

KALUPAHANA COMMENTARY

The "appeasement of the object" (drastavyopasama) is, no doubt, a synonym for the "appeasement of dispositions" (samskaropasama) or the "appeasement of obsessions" (prapancopasama). It is indeed not the elimination of the object (drastavya-ksaya), implying the abandoning of both subject and object. It is merely the appeasement of the object. What is implied by the appeasement of the object is its non-reification. The conception of the non-existence of the object will emerge only if its existence is understood in a substantial way. Existence (astitva) and non-existence (nastitva) are correlative. Assertion or denial of one involves the assertion or denial of the other respectively. Asserting existence in a metaphysical way one is led to the denial of existence. Denying existence in the same way one is led to the assertion of non-existence. Instead of eliminating both existence and non-existence and looking for a transcendent reality, a reality that is beyond both existence and non-existence, it is possible to appease, calm, or pacify one's dispositions (samskara) or obsessions (prapanca). Dispositions or obsessions, when followed to their positive extreme, lead to the belief in a permanent existence (astitva); when completely negated they contribute toward the belief in non-existence (nastitva). Hence the emphasis on their appeasement rather than their promotion or elimination.
8. This is the soteriological import of this discussion of fundamental ontology: If one reifies phenomena - including such things as one’s own self, characteristics (prominently including one’s own), or external objects - and if one thinks that things either fail to exist or exist absolutely, one will be unable to attain any peace. For one will thereby be subject to egoism, the overvaluing of oneself and one’s achievements and of material things. One will not appreciate the possibility of change, of the impermanence and nonsubstantiality of oneself and one’s possessions. These are the seeds of grasping and craving and, hence, of suffering. The alternative, Nāgārjuna suggests, and the path to pacification, is to see oneself and other entities as non-substantial, impermanent, and subject to change and not as appropriate objects of such passionate craving.
Chapter VI

रागरक्तपरीक्षा षष्ठ प्रकरणम्।

中論観染染者品第六(十偈)

रागसाक्तिपरीक्षा नाम षष्ठम प्रकरणम् ॥

Chapter VI: Examination of Desire and the Desirous
We are in the section of the text explaining the selflessness of phenomena, and having completed the first part of that section, which was the demonstration of selflessness in three phenomena, we now turn to the second part, of that section which is the refutation of the argument that there is a self in phenomena. [144:11] This section has three parts: refutation of the defilements—that which depends on the basis; refutation of the existence of the characteristics: arising, ceasing, and enduring; and refutation of the existence of the cause—agent and action. The present chapter is the first of these.
EXPLANATION:

Here someone might say that the aggregates, the elements, and the faculties exist essentially because the defilements, which depend on them, exist; and this is because the Tathagata has said, “Oh monks, when some childish, uneducated person, fallen into the extreme of reification, has seen material forms with his eyes, the mind becomes obsessed with them as the locus of pleasure. Having developed that obsession, desire arises. Having become desirous, body speech and mind act out of desire” [Pitaputrasamagama-Sutra, mDo sde nga 13b]. Thus it is said that afflictive emotions such as desire—the causes of the afflictions—exist. If such things as desire existed essentially, such things as the aggregates would also exist essentially. However, this is not the case!

This section has three parts: the refutation of the essential existence of desire and the desirous, drawing conclusions from these arguments, the application of these arguments to other phenomena.

SUMMARY:

It should be ascertained that if the three phenomena pertaining to affliction—the agent of desire, the object of desire, the instrument of desire—and the three phenomena pertaining to purification—the agent of confident reliance, the object of confident reliance, and the instrument of confident reliance—existed in the way they are grasped, as existing inherently, then as we have established through arguments, their conventional status would make no sense. Thereafter, dependent origination should be ascertained by realizing that since—while it is necessary to accord with convention—that would not be possible if phenomena existed inherently, their ontological status makes sense only as empty of essence. We could also accept this rearrangement: “The desirous one depends on desire.”

INADA (Chapter Introductions)

CHAPTER VI - Examination of Passion and the Impassioned Self

This chapter is concerned with the concepts of passion (raga, affection) and the impassioned self (rakta, the one who is impassioned and thereby "defiled"). Nagarjuna carries out the discussion on the basis of differing temporal movements. He first inquires into whether the impassioned self can exist apart from the passion and, should it be so, then the passion, in turn, must depend on it. Next, he considers simultaneous occurrence but the idea of simultaneity or concomitance of two entities is an illusion and, surely, a confusion of terms. He clearly demonstrates the fact that as one wishes for concomitance, one still desires to maintain the diversity of elements; and vice versa, as one seeks for diversity one also wishes to assert concomitance at the same time. In short, Nagarjuna indicates that diversity and unity are two different concepts which cannot be confused with reference to reality. Similarly, the concepts of passion and the impassioned self must be viewed aright, never to be spoken of together nor separately. The intimations here are towards the Madhyamika idea of the sunyata of dharmas (the "emptiness" of all factors of experience).

KALUPAHANA (CHAPTER OVERVIEWS)

6. Lust (raga). The Buddha considered lust (raga) to be the cause of most of the ills of life, the worst of these being bondage. Freedom (nirvana) was thus defined as absence of lust (vairagya). Not only did he speak of lust and absence of lust, he also often spoke of people who are lustful (rakta) and free from lust (virakta). Yet, all such statements were made with no assumption of a concealed substance (svabhava) or of a mysterious spiritual or material personality. The analyses of faculties (indriya), aggregates (skandha), and elements (dhatu) were intended to demonstrate the futility of such assumptions. However, the Sarvastivadins conceived of a substance in every element, while the Sautrantikas posited a mysterious personality.

Therefore, it became necessary for Nagarjuna to examine the concepts of lust (raga) as well as the lustful (rakta). A variety of unsatisfactory implications that arise out of the Sarvastivada and Sautrantika interpretations is clearly presented in Chapter VI, with the conclusion: “Thus, with or without the lustful, lust is not established. Like lust, all things, with or without [accompaniments], are not established.”

Once again, we should not forget the fact that the dharmas referred to here are those that were recognized by the Buddhist metaphysicians, not the empirical phenomena as defined by the Buddha and the early Buddhists.
Addiction

If an unaddicted addict
Preceded his addiction,
Addiction would depend
On someone unaddicted.

Addicts and addictions go together.

Were addicts and addictions one,
They could not go together;
Were addicts and addictions two,
How would you ever know

They were together?
If they go together,
How can they not be different?

For only different things
Can be together things.
Without differences
Nothing goes together.

Addicts and addictions
Are neither together nor untogether,
Just as all things
Are neither together nor untogether.

6. Passion and the Impassioned

If the impassioned person existed prior to the passion,
then passion could only exist dependent upon someone who
is already impassioned (v. 1). And, if the impassioned person
does not exist, there could be no passion (v. 2). Again, the
problem is the interdependence of concepts. Passion cannot
occur without someone who is passionate, and if we try to
conceive of passion as a distinct reality, we then would have
to accept that it could exist independent of the impassioned -
since it cannot, we have to give up the idea of passion and the
impassioned as being self-existent, discrete realities. This
means that because the concepts are interrelated, what they
refer to are also ontologically interrelated.

An Examination of Desire and the Desirous One

In the Sutra of the Great Mother, the Buddha taught:

Desire is perfectly pure, and therefore forms are perfectly
pure.

THE BUDDHA EXPLAINED perfect purity in a vast way. The reason desire is perfectly pure is that desire and the
one who experiences it do not truly exist; they are not real.
Therefore, there is no flaw in having desire; there is no flaw
in the desire itself because it has no inherent nature. Its
nature is therefore said to be perfectly pure.

The desire itself is perfectly pure, and therefore the
desirous one—the one who has the desire—is perfectly pure,
and the object of desire is perfectly pure. In brief, that is the
way it is.

If the essence of desire were in fact impure, then the
desirous one would be impure and the object of the desire

would be impure as well. However, since the essential nature
of desire in a dream is perfectly pure, since it is free from
any stain, the nature of the one who is feeling that desire is
perfect purity without any stain, and the nature of the object
of the desire is perfect purity free from stain. In the Sutra of
the Great Mother, there is one chapter called Perfect Purity,
comprising several volumes, and in one passage from this
chapter the Buddha states, “Desire is perfectly pure, and
therefore forms are perfectly pure. Forms are perfectly pure,
and therefore transcendent generosity is perfectly pure.
Transcendent generosity is perfectly pure, and therefore the
omniscience of the Buddha is perfectly pure.” It would be
good for you to read the chapter called Perfect Purity,
because it is easy to understand and those who read it like it
very much.

The reason Nagarjuna composed this chapter examining
desire and the desirous one was that even after he presented
the analyses of the sources of consciousness, aggregates, and
elements that demonstrate that none of these truly exist,
those who asserted the true existence of things claimed that these things do in fact exist because the mental afflictions that arise in dependence upon them exist. For example, desire exists, and this proves that the objects that desire focuses upon exist as well, because desire could not exist in their absence. Since the reason they used to try to prove that things exist is that desire exists, it was necessary for Nagarjuna to analyze and refute the true existence of desire and the desirous one.

The Vajrayana explains that the mental afflictions—the five poisons of anger, desire, stupidity, pride, and jealousy—are all perfectly pure, and so this chapter that analyzes this very point is very important to Vajrayana practice. The analysis in this chapter is applicable to all of the mental afflictions. It starts out with desire, but it can then be applied to anger, pride, jealousy, and stupidity. The reason the focus is explicitly on desire is that we are all inhabitants of the desire realm, and all of the beings in the desire realm, from the tiniest insects up to the mightiest gods and goddesses, have a lot of desire (fn There are three realms inhabited by the sentient beings in samsara: the desire realm, the form realm, and the formless realm. The latter two are more subtle and are the exclusive domain of certain gods who have spent a long time cultivating specific meditative states of absorption. The desire realm is populated by all six classes of sentient beings: beings in the hell realms, hungry ghosts, animals, humans, and certain types of gods.). That is why it is important for us to examine desire and determine that its nature is in fact perfectly pure. Gendun Chopel composed the following verse:

Blind ants run in pursuit of happiness,
Legless worms crawl in pursuit of happiness,
In short, all beings think nothing of climbing over one another in their pursuit of happiness—
All beings strive only to be happy.

The crux of this is that all beings in the desire realm have a lot of desire, which is why it is essential for us to determine that desire is perfectly pure.

The first verse in this chapter that helps us determine the purity of desire and the desirous one reads:

If before desire existed,
If without any desire there existed a desirous one,
In dependence upon that, there would in fact be desire,
For when there is a desirous one, there is also desire.

Here we are looking at the desirous one—which could refer either to the desirous individual or to the mind that experiences desire—and the desire itself. We can ask, if these things truly exist, how do they exist in terms of their sequence? Does one happen before the other, or do they occur simultaneously? We cannot say that the desire exists before the desirous one, because if it did, there would be disembodied desire floating around out there without anyone to experience it, and that would not make any sense. On the other hand, it cannot be that the one who experiences the desire, the desirous being, exists before the desire itself, because if that were the case, then there would be a desirous individual without any desire. It would necessarily follow that arhats (fn An arhat is one who has attained the highest fruition, the nirvana of either the Shravakayana or Pratyekabuddhayana. By cultivating strong revaluation for and renunciation of samsara, and by perfecting their realization of the selflessness of the individual, the arhats completely free themselves from the mental afflictions and gain liberation from samsara.) and buddhas would be desirous individuals, because in order to fit the definition of a desirous individual, it would not matter if the being had desire or not. That would not make sense either. Neither can desire and the desirous one exist simultaneously, because if they came into existence at the same time, each with its own inherent nature, there would not be any connection between them. They would be two independent things, existing separately, that could each go its own separate way. One could cease and the other could still remain. That is clearly not the case with desire and the desirous one—they can exist only in mutual dependence. Since they cannot exist sequentially and they cannot exist simultaneously, desire and the desirous one are not real; they are just like appearances in a dream.

We need to apply the same reasoning to anger and the angry one, to jealousy and the jealous one, to pride and the proud one, and to stupidity and the stupid one. We can apply the same analysis to all of these, and we should. The Vajrayana instructs us to bring the five poisons to the path, and the reasons that is possible are explained here in this chapter—in fact there are no other reasons than these.

We can look at anger and see that before the anger arises there is no angry person. It would be impossible for there to be an angry individual before the anger itself. For example, while someone is meditating on loving-kindness, there is no angry person, but if anger should arise later, there will be an angry person. So the angry person cannot exist before the anger itself. Nor can the anger exist before the one who is angry, nor can they exist simultaneously. Therefore, they cannot truly exist.

We can apply the same analysis to suffering. We need to examine suffering and the one who suffers to see which one comes first, and we see that whatever way we posit the relationship between them, it is logically impossible. Therefore, neither suffering nor the one who suffers is real.

We can look in the same way at sickness and the one who is sick: Which one comes first, the sick individual or the sickness itself? If the sick individual existed before the sickness itself, all healthy sentient beings would also be sick. In fact, sickness depends upon there being a sick individual, and vice versa, and therefore neither of them inherently exists. This is important for us to know. The great siddha
Gotsangpa sang in his vajra song of realization called The Eight Cases of Basic Goodness that sickness is not to be shunned because it is basically good; mental afflictions are not to be shunned because they are basically good; and suffering is not to be shunned because it is basically good, and we need to know the reasons that this is true (fn Gyalwa Gotsangpa was an emanation of Milarepa and a great early master of the Drukpa Kagyu lineage, four generations removed from Lord Gampopa, Milarepa’s greatest disciple.).

The same can be applied to the expectations of difficulties in the future and the problems those expectations create for us. When we expect to experience difficulties in the future, we should examine which exists first—the one who is going to experience these problems or the future problems themselves? If the causes of future suffering do not exist, then the future suffering itself does not exist. If the future suffering itself does not exist, then the individual who will suffer in the future cannot be said to exist either. Therefore, the true nature of future suffering is perfect purity, and the experience of the realization of that is open, spacious, and relaxed.

In this way, beginning with desire, we find that whatever we analyze, its nature is perfect purity. Furthermore, we can examine more and more things and see that they are all also perfectly pure by their very nature, and this allows us to experience more and more openness, spaciousness, and relaxation.

CHAPTER 6: AN EXAMINATION OF DESIRE AND THE DESIROUS ONE
6/0 Question: The sutras say that desire, hatred and delusion are the foundation of the world. Desire has various names. It is called love, or attachment, or passion, or lust, or desire, and there are other such names as these. Such obsessions depend upon living beings, and these living beings are 'impassioned'. Desire means the dharma of passion. Because of the dharma of passion and the impassioned one, there is desire. It is the same with the other two passions; where there is anger, there is an angry being, and where there is delusion, there is a deluded being.

It is because of these three poisons that the three forms of karmic activity arise and it is because of the three karmic activities that the three realms arise, and all dharmas consequently have their existence.

Reply:

(8a22) Even although the sutras mention the names of the 'three poisons', if you seek for their reality you will not find them, and why?

CANDRAKĪRTI COMMENTARY

[Chapter VIII]

Some hold that the factors of personal existence, the bases of cognition and the primal elements exist in fact. On what grounds? Because of the direct perception of the state of affliction (samklesa) which is based on these. The reasoning here is that there can be no direct perception of a state of affliction based on something which does not exist, as, for example there is no perception of the daughter of a barren woman by the son of a barren woman. So desire (raga) and the other afflictions (klesa) (fn 1 These are the structures of everyday existence; sometimes ten are given, sometimes six; Madhyamika can accept any number but invariably takes three as basic: desire (raga), aversion (dvesa), and illusion (moha). Cf. Chapter XVII.) exist because they are the necessary basis of the state of affliction.

As the illustrious one said, ‘The ordinary, unsophisticated man, o monks, succumbing to the everyday world of names and having beheld things with the eye, cleaves to those things which promise happiness. From so cleaving desire is born; seized by desire he carries out - in deed, thought and word - karmic acts born of the three afflictions, desire, aversion and illusion . . .’

Desire presupposes one desiring

In reply we say that the factors of personal existence, the bases of cognition and the primal elements would exist if desire and the other afflictions themselves existed. The reasoning here would be that desire, conceived of as real by unsophisticated, ordinary people, would presuppose a person who desires and that he would either exist or not exist. Nagarjuna says that neither alternative makes sense.

KALUPAHANA COMMENTARY

Chapter Six The Examination of Lust and the Lustful (Raga-rakta-pariksa)

GARFIELD COMMENTARY

Chapter VI Examination of Desire and the Desirous

This chapter represents a continuation of the discussion begun in the previous one. That is, while the chapter is nominally about desire, an example chosen for its obvious soteriological significance, it is in a larger sense a further discussion of the relation between entities and their properties, with specific attention to the relation between human beings and their psychological characteristics.

Locating the discussion at this point is consonant with a tradition of Mahayana discussions of emptiness in which one first addresses external phenomena, which are both easier to analyze and less susceptible of reification than the self, and then generalizes the discussion to human psychological phenomena. (fn 51. See, e.g., the Heart Sutra, with its famous discussion of the emptiness of the aggregates that begins with form and then moves to the psychological aggregates.) The chapter opens with an echo of the discussion of space:
Kārikā VI.1

INADA (Skt):
Verse 1 - If prior to and separated from the passion the impassioned self is admitted to exist, then the passion will be contingent on the impassioned self. Thus the passion exists only from the fact of the existence of the impassioned self.

JONES (Skt):
[i] If the impassioned person existed prior to having passion and thus apart from passion, then passion would be dependent upon the impassioned person - there would be passion only when there is the already impassioned.

KALUPAHANA (Skt):
If a lustful one, separated from lust, were to exist prior to lust, then depending upon him there will be lust. Lint exists when there is a lustful one.

MCCAGNEY (Skt):
If an impassioned one would exist prior to passion and separate from passion, then passion would depend on him and passion would exist only where there is an impassioned one.

NISHIJIMA (Skt?):
1. Before leaving from Excitement, The excited have been clearly included in the excitement, Something concrete clearly exists as the excitement, And in the excited the excitement might exist in front of us.

SPRUNG (Skt):
1 If the one desiring were to exist prior to his desire, that is, quite apart from desire, desire would depend on the one desiring; given one desiring there would be desire.

STRENG (Skt):
1. If the "one who desires" would exist before desire itself, then desire may be regarded. When desire becomes related to "one who desires," then desire comes into existence.

ENGLISH TRANSLATIONS

BOCKING (Ch):
6v1 If, separate from the (dharma of) passion The impassioned being pre-existed independently. Then surely the passion should arise On account of this impassioned one.

BATCHelor (Tb):
[If a desirous one without desire exists before desire, desire would exist dependent on that [desirous one]. [When] a desirous one exists, desire exists.

DOCTOR (Tb):
If before the presence of desire, The desirous one exists without desire, Based on that, there would be desire. When the desirous one exists, so does desire. [VI.1]

GARFIELD (Tb):
1. If prior to desire And without desire there were a desirous one, Desire would depend on him. Desire would exist when there is a desirous one.

GARFIELD-SAMTEN (Tb):
1. If prior to desire There were a desirous one without desire, Depending on that, desire would exist. Desire would exist when there is a desirous one.

HAGEN (paraphrase):
6.1 If the desirous one were to exist prior to desiring, then desire would depend on the desirous. Desire exists only if there is a desirous one.

GOLDFIELD (Tb):
If before desire existed, If without any desire there existed a desirous one, In dependence upon that, there would in fact be desire, For when there is a desirous one, there is also desire. (1)
Here ‘desire’ embraces being attached, the effort of desiring, cupidity and devotion. Desire has its base in the one desiring (rakta). If the one desiring exists prior to his desire, that is, quite apart from it, he would be devoid (rahita) of desire; in such case desire would be based on a desiring person who was quite separate from desire. In this way it makes sense to say that desire could arise in an existing person who desires. But this cannot possibly be — a desiring person devoid of desire — and it would necessarily follow that even the wise ones could have desires.

If, in this way, there can be no desire in a desiring person who exists, then let there be desire even if the desiring person does not exist (fn 2 i.e., if there is no person prior to the act of desiring). But this makes no sense either, Nagarjuna says:

So far Nagarjuna was considering the basic elements (dharma) involved in an explanation of the problem of perception, namely, the "faculties" (indriya), the "aggregates" (skandha), and "elements" (dhatu>). However, the analysis of perceptual experience, and therefore of the elements (dharma) involved in such experience, is not confined to these. In the Buddhist view, lust (raga) is an important constituent of perception, primarily because in Buddhism the analysis of perception was not undertaken for its own sake, but for the sake of discovering the cause of bondage and freedom.

We have already referred to the confusions created by Candrakīrti, especially in regard to the interpretation of the most crucial Chapter I where he fails to recognize the significance even of the order in which Nagarjuna takes up the variety of ideas for examination, let alone the ideas themselves.

Another unfortunate misinterpretation emerges when Candrakīrti assumes that every initial verse in every chapter represents a statement of the opponent's view which is to be repudiated. While this may be true in some chapters, there is no need to universalize it. There is no reason why Nagarjuna could not take up his or the Buddha's views first and then go on to repudiate what are considered to be inappropriate ideas. In the Buddha's own analysis of perception, obsessions (prapañca) appears in a personality that is already smeared with lust. The Buddha consistently avoided any speculation regarding absolute origins. As such, he was not willing to assume either a pure personality, a tabula rasa which comes to be defiled by adventitious elements (see A 1.254) or the existence of an element called lust (raga) in the external world independent of a conscious person who generates lust on the basis of external objects (see S 1.22). For him, objects can be classified as pleasurable (subha), loathsome (asubha), or neutral only in relation to a perceiving individual who is prone to make such distinctions. A person who is prone to make such distinctions is one who is either dominated by lust (raga) or aversion (dosa) or indifference.

Thus, Nagarjuna is able to assert that if any object were to cause any lust (raga), then there must be a lustful one (rakta), not simply a "pure person" who is untainted by lust. For him, there is no difficulty in speaking of lust, so long as that lust is not distinguished as an entity which is then supposed to infect a person who is pure and undefiled by lust. It is the same sort of relation that is exemplified by a compassionate one (maitra) and the recipient of compassion (upagrahaka), a very apt example given by Candrakīrti to illustrate the conception of "otherness" (paratva), but which has been misunderstood by many a translator [Sprung, Lucid Exposition who was probably following Stcherbatsky's earlier translation]. There is no sense in speaking of a compassionate one or even compassion in a vacuum. A compassionate one or compassion becomes meaningful only in the context of people who are recipients of such compassion. The same sort of relationship exists among the lustful (rakta), lust (raga), and the objects that generate lust in the individuals. The present verse, therefore, is a clear statement of Nagarjuna's own position, not the statement of an opponent that is to be rejected.

1. One possibility for the relationship between the subject of desire and the desire is that the desirous one exists qua desirous one independently of the desire, which is then adventitious and dependent. That is, on this view the desirous one is inherently desirous, but the desire is merely dependent. This, however, is problematic, for then there is a real contrast in the mode of existence of the desirous one and the desire: The desirous one truly exists, but the desire does not truly exist. But if there is no real desire, in virtue of what is there a desirous one?
Kārikā VI.2

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 2 - Again, from the non-existence of the impassioned self, where can the passion be? Whether the passion exists or does not, (once again), the impassioned self can be treated in the same manner.

JONES (Skt):
[2] On the other hand, when the impassioned person does not exist, how can there be passion? Whether or not passion or the impassioned exist, the analysis would be the same.

KALUPAHANA (Skt):
When a lustful one does not exist, whence can there be lust? Whether lust exists or not, the method (of analysis) even of the lustful one would be comparable.

MCCAGNEY (Skt):
Again, where an impassioned one does not exist, where will there be passion?
The passion neither exists nor does not exist in the impassioned and vice versa.

NISHIJIMA (Skt?):
2. Because it is perfectly impossible for excitement to exists in the excited again,
How is it possible for everyone to know where the excitement can exist actually?
However, it is not clear whether excitement exists in the excitement itself, or in the excited,
And so the real facts in front of us are going on naturally and smoothly.

SPRUNG (Skt):
2 If the desiring one does not exist, how, precisely, will desire arise? If the desiring one himself exists the consequence is the same whether desire exists or not.

STRENG (Skt):
2. If there is no one who desires, how then will desire come into being? And the question whether desire exists or does not exist likewise holds true for the one who desires.

BOCKING (Ch):
6v2 If there were no impassioned one, How could there be passion?
When passion exists or does not exist It will be the same for the impassioned.

BATCHelor (Tb):
If there were no desirous one, how could there be desire?
The same follows for the desirous one too: [it depends on] whether desire exists or not.

DOCTOR (Tb):
Yet if the desirous one does not exist, How could there possibly be desire?
Given the presence or absence of desire, This follows also in the case of the desirous one. [VI.2]

GARFIELD (Tb):
2. Were there no desirous one, moreover, Where would desire occur?
Whether or not desire or the desirous one exist, The analysis would be the same.

GARFIELD-SAMTEN (Tb):
2. Were there no desirous one, moreover, Where would desire occur?
With respect to the desirous one, whether or not desire exists, The analysis would be the same.

HAGEN (paraphrase):
6.2 If the desirous one were to exist apart from desire, desire would exist only if a desirous one existed. But if desire were not inherently existent, how could there be one who desires?
PINGALA COMMENTARY

6/2 If there really is an established impassioned one beforehand, then there is no need for any further passion, because the impassioned one already has passion. If no impassioned one exists beforehand, in this case too no passion should arise, for there must first be an impassioned one for passion to arise subsequently. If there were no impassioned one beforehand, there would be no one to receive the passion. It is the same with passion itself. If passion really pre-existed apart from the individual it would be without a cause, so how could it arise? It would be like a fire without fuel. If no fixed passion existed beforehand, there would be no impassioned one. For this reason it says in the verse, 'when passion exists or does not exist, it will be the same for the impassioned'.

Question. If it is impossible for passion and the impassioned one to arise one after the other in reciprocal dependence, what is wrong with them arising simultaneously?

Reply:

CANDRAKĪRTI COMMENTARY

2ab *If the desiring one does not exist, how, precisely, will desire arise?*

As there can be no desire if the desiring person exists, how can there be if the desiring person does not exist? Will a desire, which is without a basis, be conceded existence? For a fruit which does not exist cannot possibly ripen.

One desiring presupposes desire

Someone may interject: ‘Even though you repudiate desire none the less the one who desires exists as he has not been repudiated; but one who desires does not make sense in the absence of desire; therefore desire exists as well.’ Our rejoinder is that desire would exist if the one desiring existed. That is, if one postulates a person who desires then one must suppose either that desire exists or that it does not. But Nagarjuna says that neither alternative is intelligible.

2cd *If the desiring one himself exists the consequence is the same whether desire exists or not.*

If one postulates a desiring one on the supposition of an existing desire, it will follow that in this case too desire is unintelligible, parcelling the argument just given where the one desiring was supposed to exist. ‘If desire were to exist prior to the one desiring, that is, quite apart from anyone desiring . . .’, (MMK VI.1 The argument is now applied to desire instead of to the one desiring) and so on. Or one can consider the one desiring on the supposition that the desire does not exist. But this makes no sense either. Because if the desire does not exist, how can there be one who desires?’ (fn 3 This adapts kārikā 2ab) It follows that the one desiring does not exist. As then neither desire nor the one desiring exist, the factors of personal existence, the bases of cognition and the primal elements do not exist.

Simultaneity or conjunction of desire and the one desiring

Someone may interject that desire and the one desiring do not arise one after the other as our attack supposes. Rather, the desire and the one desiring arise simultaneously (sahaiva) (fn 4 Or, ‘in conjunction’; the temporal factor predominates). It is by a desire arising simultaneously with a state of mind that the latter is desirous, and that is the ‘one desiring’. So both desire and the one desiring exist in fact. Nagarjuna replies that here too

KALUPAHANA COMMENTARY

Thus, Nagarjuna raises the question as to how there could be lust in the absence of a lustful one. This avoids the theory of a tabula rasa and the adventitious impressions. Let alone the existence or the non-existence of lust, even the lustful one has to be analysed in terms of dependence, not in terms of pure entities having their own self-nature (svabhava).
2. But if there is no desirous one, there is no ontological basis for the desire. So whether we posit an inherently existent desirous one or no desirous one at all, we cannot identify desire as existing. And, of course, this goes for any characteristic or psychological attribute and for any subject of any such attribute identified under any description. Moreover, the converse is also true: Whether or not we posit inherently existent desire, we cannot thereby establish the existence of a substantially existent desirous one. If the desire does not exist inherently but only dependently, that dependence in no way presupposes an independent basis. If on the other hand desire is posited as inherently existent, there would be no need for a basis in a desirous one at all. In neither case would the substantial existence of the entity in question (subject or attitude) have any import for the reality of the correlative entity (attitude or subject). And the reason for this is simply that inherent existence is not relational existence. Since desire and the desirous one must be understood as interrelated, they must be understood as mutually dependent.
Kārikā VI.3

sahaiva punar udbhūtir na yuktā rāgaraktayoh |
bhavetāṃ rāgaraktau hi nirapekṣau parasparam ||3||

rān zhē jī rān fā jūjū chéng zé bū rān
rān zhē rān fā jūjū zé wū yǒu xiàng;xiāng dāi
| 'dod chags daṅ ni chags pa dag || lhan cig niid du skye mi rigs |
| 'di ltar 'dod chags chags pa dag || (4b1)phan tshun ltos pa med par 'gyur |

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 3 - Again, simultaneous occurrence of the passion and the impassioned self is inconceivable because, surely, both of them are not mutually dependent on each other for existence.

JONES (Skt):
[3] The simultaneous arising of passion and the impassioned cannot occur because they would then be mutually independent.

KALUPAHANA (Skt):
Again, the simultaneous occurrences of lust and the lustful one is not proper. Lust and the lustful one would then be mutually non-contingent.

MCCAGNEY (Skt):
Again, the conjunction of the passion along with the impassioned does not exist. Indeed, that would make passion and the impassioned independent of one another.

NISHIJIMA (Skt?):
3. Something, which is very enduring, will appear again, and that does never explain the fusion between the excited and the excitement at all.

Because what is hopeful is the co-existence of the excitement and the excited, The reason why the excitement and the excited might not be recognized with each other, comes from the facts that the excitement and the exited are independent mutually.

SPRUNG (Skt):
3 The simultaneous arising of desire and the one desiring does not make sense; Desire and the one desiring would arise independently of one another.

BOCKING (Ch):
6v3 For the impassioned one and the passions To be established both together is not correct, For if the impassioned and the passions could combine They would not be mutually dependent.

BATCHelor (Tb):
It is not reasonable for desire and the desirous one to arise as co-existent. In this way desire and the desirous one would not be mutually contingent.

DOCTOR (Tb):
Desire and the desirous one Cannot reasonably arise together. In this case, desire and the desirous one Would not depend on one another. [VI.3]

GARFIELD (Tb):
3. Desire and the desirous one Cannot arise together. In that case, desire and the desirous one Would not be mutually contingent.

GARFIELD-SAMTEN (Tb):
3. Desire and the desirous one Cannot arise simultaneously. In that case desire and the desirous one Would not be mutually dependent.

HAGEN (paraphrase):
6.3 Desire and the desirous one cannot occur concomitantly since, in that case, they'd arise independently of each other.
6/3 If passion and the impassioned were established simultaneously, they would not be reciprocally dependent. There would be passion independent of the impassioned and there would be the impassioned independent of passion, and these two would be permanencies, being already established and without any causes. Once permanence is admitted many errors follow, but no liberation. Furthermore, we will now refute passion and the impassioned in terms of unity and difference.

CANDRAKĪRTI COMMENTARY

3ab The simultaneous arising of desire and the one desiring does not make sense;
that is the simultaneous origination of desire and the one desiring does not make sense; because,
3cd Desire and the one desiring would arise independently of one another.

Because of their being simultaneous, like the right and left horns of a cow, is the meaning.
Now the simultaneity (sahabhave) of these two, desire and the one desiring, would have to be conceived either as resting on their identity (ekatva) or on their difference (prthaktva) (fn 5 Or, ‘separateness’). The first case, that they are identical, does not make sense. Because

KALUPAHANA COMMENTARY

To conceive of lust or the lustful one in vacuity and then proceeding to explain their simultaneous arising (sahaiva udbhutir) is not the purpose of “dependent arising.” In such a case, what is found is independent existence of lust as well as the lustful one, each having its own nature. This, once again, represents Nagarjuna’s rejection of the substance/attribute relationship. “Cow-ness” implies the fact of having “four legs;” the latter is not an independent attribute of the former. The dangers inherent in carrying out the analytical process initiated by the Buddha to its extreme is here indicated. Analysis is useful in eliminating metaphysics, but useless when its leads to further metaphysics.

GARFIELD COMMENTARY

3. Another possibility the opponent might suggest is this: Desire and the desirous one come into inherent existence at the same time. It is very important in following this argument to remember Nāgārjuna’s dialectical task. The opponent against whom his reductios are aimed is one who attributes inherent existence either to the desirous one, to desire, or both. Nāgārjuna is only attempting to show that attributing to them that kind of existence is incoherent not that there is no desire and that there are no desirous people at all. That would be crazy. Fundamental to the Buddhist conception of the predicament of human existence is the centrality of craving to the arising of suffering. But also fundamental is the conviction that there can be a release from craving. That is only possible, however, if craving is dependently originated since only then could the conditions that determine its arising be eliminated. So it is critically important from a Buddhist perspective to come to a complete understanding of the nature of desire, and the mode of its existence, and it would be inconceivable to deny its existence completely. But Nāgārjuna is emphasizing here that that understanding must reveal them as mutually dependent in order to avoid the absurd conclusion that either could exist without the other. That precludes the assertion that while they in fact always co-occur, that co-occurrence is not through interdependence, but through contingent simultaneity of independent phenomena. Nāgārjuna’s claim in VI: 3 is also the conclusion of the argument that is about to follow. It proceeds by means of a destructive dilemma. Given that the opponent must have desire and the desirous one arising simultaneously, they must be either identical or different. Nāgārjuna will show that neither alternative is coherent; VI: 4 spells out this strategy.
INADA (Skt):
Verse 4 - In a unity (of passion and impassioned self), there is no concomitance because a thing does not come together with another. In a diversity, on the other hand, how does such a concomitance arise?

JONES (Skt):
[4] Nor is there coexistence in what is one, for nothing arises simultaneously with itself. But how can what is separate exist together (i.e., co-exist)?

KALUPAHANA (Skt):
In identity, there is no co-existence. That which is associated does not arise together. In discreteness, how can there be co-existence?

MCCAGNEY (Skt):
There exists no concomitance in identity because one is not with the other. Moreover, in difference where will there be concomitance?

NISHIJIMA (Skt?):
4. All things and phenomena are not only one, Therefore they have to exist at one place together. Because they are being there separately, therefore they can exist there just now, Where is it possible for them to live in future for ever?

SPRUNG (Skt):
4 There can be no simultaneity in identity; There can be no simultaneity of something with itself. Again, how can there be simultaneity of what is entirely separate?

STRENG (Skt):
4. Concomitance does not exist in that which is only one thing, for certainly something which is only one thing cannot be concomitant. But yet, how will concomitance come into being if there are separate (prthak) things?

BOCKING (Ch):
6v4 If the impassioned and passion are one, How can one dharma combine? If the impassioned and passion are different, How can different dharmas combine?

BATCHelor (Tb):
Identity has no co-existence: something cannot be co-existent with itself. If there were difference, how could there be co-existence?

DOCTOR (Tb):
Identical things are not coexistent, As nothing is coexistent with itself. Yet if they are different, How could they be coexistent? [VI.4]

GARFIELD (Tb):
4. In identity there is no simultaneity. A thing is not simultaneous with itself. But if there is difference, Then how would there be simultaneity?

GARFIELD-SAMTEN (Tb):
4. In identity there is no simultaneity. A thing is not simultaneous with itself. But if there is difference, Then how could there be simultaneity?

HAGEN (paraphrase):
6.4 There is no concomitance in a unitary thing. But how can there be concomitance if there is difference?
PINGALA COMMENTARY

6/4 Either passion and the impassioned combine as one dharma, or they combine as different dharmas. If they are one then they do not combine, and why? How can one dharma combine with itself? It is like a fingertip which cannot touch itself. As for them combining as different dharmas, this too is impossible, and why? Because they are different. If each dharma is already complete then there is absolutely no need for further combination, for even though combined, they will still remain different.

Moreover, unity and difference are both impossible, and why?

CANDRAKĪRTI COMMENTARY

4a There can be no simultaneity in identity;
Nagarjuna explains why that is:
4b There can be no simultaneity of something with itself.
The essential nature of a desire, which cannot be distinguished from the desire, cannot be held to be simultaneous with the desire.

Concerning the second case, Nagarjuna says there is no simultaneity of what is separate.

4cd Again, how can there be simultaneity of what is entirely separate?

Indeed one never observes the simultaneity of things each of which exists separately like light and darkness or samsāra, the death-birth cycle, and nīrāṇa.

KALUPAHANA COMMENTARY

The philosophical problems created by an over-extended analytical process cannot be resolved by either a conception of identity or of discreteness. The relationship of co-existence (sahabhava) cannot be established once the analysis leads to a sharp dichotomy between substance and attribute.

GARFIELD COMMENTARY

4. In the first line of this verse, Nāgārjuna points out the relational character of simultaneity. If simultaneity is predicated, it must be predicated of two distinct things that arise at the same time. We don’t say that a thing arises simultaneously with itself. But if things are completely distinct in nature, they cannot co-occur in the same place, that is, if desire and the desirous one had distinct essences, they could not be in the same place at the same time.
Kārikā VI.5

Ekātvā sābhāvavat sahāvatah vināpi saḥ.
Pṛthaktvā sābhāvavat sahāvatah vināpi saḥ. ||5||

Gal te tha dad lhan cig na | | gogs (2)med par yaṅ der 'gyur ro |

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 5 - If (it is admitted that) there is concomitance in a unity, then concomitance may also occur without a coming together. If (it is admitted that) there is concomitance in a diversity, then concomitance may also occur without a coming together.

JONES (Skt):
[5] If co-existence were a unity, it would exist without the association of passion and the impassioned. On the other hand, if co-existence were not a unity but instead there were separate and distinct parts, it would also exist without any association.

KALUPAHANA (Skt):
If, in identity, there were to be co-existence, it could occur even without association. If, in discreteness, there were to be co-existence, it could occur even without association.

MCCAGNEY (Skt):
Would identity be with as well as without this concomitance?
Would difference be with as well as without this concomitance?

NISHIJIMA (Skt?):
5. Even at one time if the enduring existence can exist, then even the enduring world does not need any kind of enduring. But the enduring existence exists in the separated situations, the enduring world does not need any endurance at all.

SPRUNG (Skt):
5 If there could be simultaneity in identity, then there would be simultaneity even without the second component; if there could be simultaneity based on separate existence there would be simultaneity even without the second component.

STRENG (Skt):
5. If concomitance applied to that which is only one thing, then that one "with concomitance" would be that one "without concomitance." If concomitance applied to separate things, then that one "with concomitance" would be that one "without concomitance."
PINGALA COMMENTARY

6/5 If passions and the impassioned were one, this combination, then they should not need any further causes and conditions to be a combination. And if they are different and yet combined, then they ought to combine even though remote from each other.

Question. That one thing does not combine may be granted, but we see with our eyes that different dharmas unite.

Reply:

CANDRAKĪRTI COMMENTARY

If there were simultaneity in identity, then one then there would be simultaneity in one component could say ‘wherever there is identity there is which had been defined as different from the other as a simultaneity’ and then there would be simultaneity of even one of the two components. Again, if simultaneity a cow is different than a horse and other animals.’ Further,

Reciprocity of simultaneity or conjunction and separateness or difference

KALUPAHANA COMMENTARY

The Sarvastivada conception of identity in terms of coexistence comes to be overshadowed by identity (just as substantial existence (svabhava), each substance being a much as the three Platonic forms: truth, beauty, and goodness could be found in a more comprehensive form, i.e., Good). The Sautrantika analysis of reality into discrete momentary entities (comparable to the Humean simultaneity or conjunction and impressions) led to an explanation of co-existence in terms separateness or difference of “association.” In fact, such co-existence did not need any "association." Things could co-exist even without association. Thus, association is not a viable solution to problems either of identity or of discreteness.

GARFIELD COMMENTARY

5. The first claim is meant to be a reductio on the view that simultaneous things can be identical. For suppose that there was an apparent pair of events whose simultaneity was in question, say William Clinton’s uttering of the oath of office of the presidency and the inauguration of the first .president from Arkansas. If there is every reason to believe that these events are distinct but occur at the same time, it is then appropriate to say that they are simultaneous. But if we know that there is in fact only one event, it is at best a joke to assert its simultaneity with itself. The proper thing to say then would be not that the oath taking was simultaneous with the inauguration but that it was identical to the inauguration. The term translated as “association” here (griñspa) can also mean friendship, or companionship - the idea is of something distinct but accompanying. For the inauguration and the oath taking to be associated would be for them to be, say, accompanying rituals that could in principle occur independently. But if they could occur independently, they cannot be identical. Simultaneity requires association of some kind. But identity is incompatible with association.

The second claim is meant to be a reductio on the view that simultaneous and associated things could be different in nature. Difference, like identity, is incompatible with association, though for a different reason. The kind of difference at issue here is essential difference. Nāgārjuna’s claim is that things that are completely different from one another, that are completely independent, ipso facto, stand in no relation to one another and so are not associated. This is another application of the Humean (and Tractarian) argument Nāgārjuna has mobilized above: If phenomena are distinct - indeed, being simultaneous, they are not even argued to be causally related - they can be imagined to be separate. So they are then logically independent. But that would then entail that if desire and the desirous one were different in this strong sense, we could imagine a desirous one without desire, and vice versa. But that is of course absurd. So if desire and the desirous one are supposed to arise simultaneously, they can neither be identical nor different. Of course, since any inherently different entities, in virtue of having determinate natures, are either identical or different, it follows that desire or the desirous one are either nonsimultaneous or empty of inherent existence.
Kārikā VI.6

prthaktve sahabhāvaś ca yadi kim rāgaraktayoḥ |
siddhāḥ prthakprthagbhāvaḥ sahabhāvo yatas tayoḥ ||6||

ruò yi ér yòu hé:gé rán rán zhè hé shì |
shi ěr xiàng;xiāng xiān yì rán hòu shuí hé:gé xiàng;xiāng

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 6 - If there is concomitance in a diversity, in what manner does the passion and the impassioned self exist together? For then concomitance arises when there is a completion of the two separate entities.

JONES (Skt):
[6] However, if there were co-existence in the separateness, how can the separate existence of both passion and the impassioned be established? Only from that could “existing together” be established.

KALUPAHANA (Skt):
If there were to be co-existence in discreteness, is it the case that lust and the lustful one are completely separated, as a result of which their coexistence is also established.

MCCAGNEY (Skt):
If there is concomitance of the passion and the impassioned in the difference, what is distinct and how is their concomitance established in it?

NISHIJIMA (Skt?):
6. When enduring existence has been separated, Then what are the two independent between the excitement and the excided?
Accomplished articles are existences, which are separated from each other one by one.
Enduring existences are things that and this, which are independent and concrete.

SPRUNG (Skt):
6 If there is simultaneity in separateness, how will the separateness of a desire and of the one desiring be established, on the basis of which they would be simultaneous?

STRENG (Skt):
6. And if concomitance applied to separate things, what is the proof for the separation of both desire and the one who desires, Since that which is non-separate is concomitant.
PINGALI COMMENTARY

6/6 If passion and the impassioned one initially have different, fixed characteristics, and then afterwards unite, this is no unity, and why? Because their two characteristics, being previously different, are then later arbitrarily spoken of as a unity. Moreover.

CANDRAKĪRTI COMMENTARY

The simultaneity of a desire and the one desiring is imagined to rest on their separateness. How will their separate existence be established (siddhi)? How can the one desiring be established apart from dependence on the desire so that there could be simultaneity of both? After all, the simultaneity of cow and horse, which have been established as separate, is a matter of direct observation. But desire and the one desiring have not been established in this way; so there is no simultaneity of the pair.

Again, on the other hand it is clear that there is no simultaneity of two things established as separate.

KALUPAHANA COMMENTARY

The problem of "association" arises more with the conception of "discreteness," than with the notion of identity. "Association" was not much of a concern for the Sarvastivadins. However, it was indeed a major problem for the Sautrantikas. Hence their emphasis on the conception of "immediate contiguity" (samanantara). For Hume, with a similar atomic analysis of experience, "association" was the glue that bound together the discrete impressions. The present question of Nagarjuna was a challenge to that Sautrantika (Humean) theory of the "ideas of association."

GARFIELD COMMENTARY

6. This last verse emphasizes and spells out the point scouted above: We are left with a hard choice once we conceive of desire and the desirous one as entities. If desire and the desirous one are conceived as substantially different but simultaneous, we would have to be able to establish the nature and existence of each independent of the other. That is no easy task. If we could accomplish it, simultaneity would be a satisfactory solution to the dilemma. But of course we cannot. Moreover, Nagarjuna argues in the next verse, if they are completely different, we are left with the peculiar task of explaining why they always go together. And asserting their simultaneity forces this problem:
ENGLISH TRANSLATIONS

INADA (Skt):
Verse 7 - Moreover, if there is an establishment of the diverse (nature of) passion and the impassioned self, then what is the purpose of your contriving a concomitance of the two?

JONES (Skt):
[7] But if passion and the impassioned are established as distinct entities, why do you think they exist together?

KALUPAHANA (Skt):
If complete separation between lust and the lustful one is established, for what purpose do you conceive of their co-existence?

MCCAGNEY (Skt):
If the individuality of passion and the impassioned is established, for what purpose do you determine their concomitance?

NISHIJIMA (Skt?):
7. Things, which have been accomplished, are usually, each of them is independent and separate. Then in that case the excitement and the excited might belong to the oneness between the excitement and the excited. How is it possible for enduring existence to become the aim? But now you are very diligent to become successful for you to rely upon Reality.

SPRUNG (Skt):
7 Again, if the total separateness of desire and the one desiring is established, What purpose will you suppose the simultaneity of these two to have?

STRENG (Skt):
7. Or, if the separateness of desire and the one who desires really were proved, Why do you imagine the concomitance of them both?
PINGALA COMMENTARY

6/7 If passion and the impassioned one each previously
had its own distinct characteristics, how can you now
arbitrarily speak of them as a unity? Again,

CANDRAKĪRTI COMMENTARY

7ab Again, if the total separateness of desire and the one
desiring is established,

    If the opponent supposes this, what then, Nagarjuna
    asks, of this supposed, ineffective simultaneity?

7cd What purpose will you suppose the simultaneity of
these two to have?

    Simultaneity is conceived to serve the purpose of
    establishing desire and the one desiring. But there can
    be no simultaneity of two things if each is not
    established as separate, and the opponent is assuming
    that each has been established as separate. But if this is
    so what is to be achieved by establishing their
    simultaneity? That is,

KALUPAHANA COMMENTARY

The usefulness of appealing to co-existence after
analysing events into discrete entities is here questioned.
Nagarjuna's approach here is to resolve the very idea that
gave rise to the problem rather than solving it, namely, to
avoid creating sharp distinctions instead of trying to find
solutions to problems generated by such distinctions.
Kārikā VI.8

prthag na sidhyatīty evaṃ sahabhāvaṃ vikāṅkṣasi |
sahabhāvaprasiddhyartham prthaktvaṃ bhūya icchasi ||8||

yì xiàng;xiāng wú yòu chéng shì gú rú yù hégé 
hégé xiàng;xiāng jìng wú chéng ér shuí yì xiàng;xiāng

| tha dad grub par ma gyur pas | | de phyir lhan cig ’dod byed na |
| lhan cig rab tu grub pa’i phyir | | tha dad ŋid du yaṅ ’dod dam |

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 8 - You say that there is no establishment of the diversity (of entities) and, at the same time, you seek for concomitance. On the other hand, while projecting the establishment of concomitance, once again, you are desirous of diversity.

JONES (Skt):
[8] Since separateness is not established, you desire co-existence - but for the sake of establishing co-existence, you desire separateness.

KALUPAHANA (Skt):
You fancy co-existence assuming that the discrete is not established. You, again, look for discreteness for the purpose of establishing co-existence.

MCCAGNEY (Skt):
You aim at concomitance and thus difference is not “established.” You look for the existence of difference for the purpose of explaining concomitance.

NISHIJIMA (Skt?):
8. Things, which are separated one by one, are not called what has been accomplished.
Therefore, enduring existences are expected so strongly by you. Enduring existence might be becoming successful in the aim, And so you are expecting eagerly to become enduring one by one.

SPRUNG (Skt):
8 You suppose simultaneity even though separate existence is not established. And yet you seize on separateness for the sake of establishing simultaneity.

STRENG (Skt):
8. You postulate concomitance by saying: neither is proved separate from the other. And you postulate separateness even more to prove concomitance.
PINGALA COMMENTARY

6/8 Having failed to establish the relationship between passion and the impassioned one in terms of different characteristics, you then say that they have a unity of characteristics. But there is a flaw in this unity of characteristics and it does not establish (the relationship between) passion and the impassioned one. So then, in order to establish their unity of characteristics you again assert their difference in characteristics. You yourself have fixed (concepts) but what you assert, is unfixed, and why?

CANDRASKRTI COMMENTARY

8ab You suppose simultaneity even though separate existence is not established.

It is obvious that desire and the one desiring cannot be established separately if you consider only their simultaneity. And there can be no simultaneity unless these have been established separately.

8cd And yet you seize on separateness for the sake of establishing simultaneity.

It being thus clear that the opponent’s proof is established on a reciprocal relationship, which of the two is the basis of proof and which is the proven? That is to say

KALUPAHANA COMMENTARY

No better explanation of the dilemma of an analytical philosopher who recognizes discreteness can be found than in the present statement of Nagarjuna. The vicious circle in which one gets involved when, after analysing things into discrete entities, one tries to put things together is clearly explained here.

GARFIELD COMMENTARY

8. We have not established - nor could we - that desire and the desirous one are substantially different. But the opponent wishes to assert their simultaneity. Given the entailment of difference by simultaneity as per the argument above, this would force the opponent to assume the impossible burden of demonstrating this substantial difference. The whole quandary is summed up in VI: 9. Since we can’t establish their difference in entity, we can’t establish the claim that desire and the desirous one arise as distinct, simultaneous phenomena. We don’t even have two phenomena to serve as the relata of difference:
Kārikā VI.9

prthagbhāvāprasiddheś ca sahabhāvo na sidhyati |
katamasmin prthagbhāve sahabhāvam saṁtecchasi ||9||

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 9 - Without the establishment of diverse entities, there is no concomitance. In what kind of diversity (of entities) are you desirous of establishing concomitance?

JONES (Skt):
[9] Because separateness is not established, co-existence is also not established - from what separate entities, do you expect co-existence?

KALUPAHANA (Skt):
When discreteness is not established, co-existence is not established. In the presence of what kind of discreteness would you expect co-existence.

MCCAGNEY (Skt):
Concomitance is not established and individuality is not explained.
You are looking to which, individuality or difference?

NISHIJIMA (Skt?):
9. Being one by one is never be successful, And so enduring existence does never mean accomplishment. Being the better one might be the existence between the two, Therefore actually you are so anxious to endure existence.

SPRUNG (Skt):
9 If separateness does not exist, simultaneity cannot establish it; but if separateness does exist then what simultaneity can you have in mind?

STRENG (Skt):
9. Because separateness is not proved, concomitance is not proved. What kind of separateness must exist for you to establish concomitance?

BOCKING (Ch):
6v9 Since you have not established differences in characteristics Their unity of characteristics remains unestablished. Within what kind of difference, then Do you wish to speak of a unity?

BATCHelor (Tb):
Since different things are not established, co-existent things are not established. If there existed any different things, one could assert them as co-existent things.

DOCTOR (Tb):
When things are not established as different, Neither are they established as coexistent. When there is a thing that is different, It may be claimed that it is coexistent. [VI.9]

GARFIELD (Tb):
9. Since nothing different has been established, If one is asserting simultaneity, Which different thing Do you want to say is simultaneous?

GARFIELD-SAMTEN (Tb):
9. Since the nature of difference has not been established, The nature of simultaneity cannot be established. In virtue of what nature of difference, Do you say that there is a nature of simultaneity?

HAGEN (paraphrase):
6.9 Since difference is not established, concomitance is not established. What kind of difference can there be that would establish concomitance?
PINGALA COMMENTARY

6/9 Since a difference in characteristics between the passions and the impassioned one has not been established, their unity of characteristics is not established either. In terms of what kind of difference do you want to speak of a unity of characteristics?

Further.

CANDRAKĪRTI COMMENTARY

There can be no separateness existing as such and unrelated to simultaneity, in which simultaneity could be established. Nagarjuna says it is simply impossible: ‘if separateness does exist then what simultaneity can you have in mind?’ Thus, concluding the analysis carried out, Nagarjuna says, insisting that desire and the one desiring have not been established,

KALUPAHANA COMMENTARY

Nagarjuna's question here is specifically on the nature of discreteness. If discreteness is absolute, then association of co-existent entities is not acceptable. If there is no such discreteness, then there is no need for coexistence, for the lack of complete discreteness implies "dependence" (pratityasamutpada). Hence, the question pertains to the kind of discreteness envisaged.

GARFIELD COMMENTARY

9. The conclusion, as stated in the special case in the preceding verse, is generalized in the final verse of the chapter. Once we think of entities and their properties - in particular, ourselves and our characteristics - as independently characterized things, we can make no sense of how they fit together temporally, logically, or ontologically. It is important that objects and their characteristics, persons and their states, be unified. But if we introduce essence and entity into our ontology, this will be impossible:
Kārikā VI.10

evam raktena rāgasya siddhir na saha nāsaha |
ṛgavat sarvadharmāṇaṃ siddhir na saha nāsaha ||10||

rú shì rǎn rǎn zhé fēi hé;gé bù hé chéng |
zhū fǎ yì rú shì fēi hé;gé bù hé chéng

| de ltar ’dod chags chags pa dag || lhan cig lhan cig min mi ’grub |
| ’dod chags bźin du chos mams kun || lhan cig lhan cig min mi ’grub |

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 10 - Consequently, there is no establishment of passion with or without the accompaniment of the impassioned self. Similar to passion, there is no establishment of the dharmas (i.e., factors of existence) with or without the accompaniment (of the dharmaic self).

JONES (Skt):
[10] Therefore, passion and the impassioned cannot be established either as existing together or as not existing together. As with passion, there is no establishing of any basic phenomenon as existing together with another or as not existing together.

KALUPAHANA (Skt):
Thus, with or without the lustful one, there is no establishment of lust. Like lust, there is no establishment of anything with or without [accompaniments].

MCCAGNEY (Skt):
Thus nothing is established about passion with or without the impassioned.
Like passion, nothing is established about events with or without a others.

NISHIJIMA (Skt?):
10. In this method, relying upon the excited, or being included by the excitement,
The real accomplishment is sometimes following situations, and sometimes it is not following to the situations.
What is similar to the Excitement, seems to be the whole Universal Situations,
And so the accomplishment of the Universe is not so following to us sometimes, and not so unsuitable for us sometimes.

SPRUNG (Skt):
10 Thus desire cannot be established either in conjunction with or independently of the one desiring. As in the case of desire, none of the elements of existence can be established either as simultaneous or as not simultaneous.

STRENG (Skt):
10. Thus there is no proof that the desire is concomitant with or not concomitant with one who desires. From this analysis of desire it can be shown that for every fundamental element (dharma) there is no proof of concomitance or non-concomitance.

BOCKING (Ch):
6v10 Just as in the passions and the impassioned one
Neither combination nor non–combination is found.
So all dharmas are the same;
Neither combination nor non–combination is found.

BATCHelor (Tb):
In that way, desire and the desirous one are not established as co-existent or not co-existent. Like desire, all phenomena are not established as co-existent or not co-existent.

DOCTOR (Tb):
Therefore, desire and the desirous one
Are not established as coexistent or otherwise.
As is the case with desire and the desirous one,
No phenomena are established as coexistent or otherwise. [VI.10]

GARFIELD (Tb):
10. Thus desire and the desirous one
Cannot be established as simultaneous or not simultaneous.
So, like desire, nothing whatever
Can be established either as simultaneous or as nonsimultaneous.

GARFIELD-SAMTEN (Tb):
10. Thus desire and the desirous one
Cannot be established as simultaneous or as not simultaneous.
So, like desire, no phenomena whatever
Can be established as simultaneous or as nonsimultaneous.

HAGEN (paraphrase):
6.10 Thus desire is not established either with or without the desirous one. Like so, no element of existence can be established as either concomitant with or different from another.
PINGALA COMMENTARY

6/10 As with passion, so it is with hatred and delusion. As with the three poisons, so it is with all the afflictions and all dharmas, which neither precede nor succeed each other and are neither combined nor separate, but are wholly established through causality.

CANDRAKĪRTI COMMENTARY

10ab Thus desire cannot be established either in conjunction with or independently of the one desiring.

Even as desire and the one desiring cannot be established either one after the other or simultaneously, so, extending this conclusion to all things, Nagarjuna says

10cd As in the case of desire, none of the elements of existence can be established either as simultaneous or as not simultaneous.

That is, one proceeds, as with desire and the one desiring, to show the non-existence of aversion and the one averse, delusion and the one deluded and so on for the other afflictions.

Precisely for these reasons the illustrious one said, ‘Something which would be desire, either as the seat or the object of desire; something which would be aversion, either as the seat or the object of aversion, something which would be deludedness either as the seat or the object of delusion; such an element of existence one never discerns directly nor perceives in any way. The one who does not discern such an element directly nor perceive it in any way is said to be without desire, without aversion, without delusion, to have a mind free from false belief: to be a realized man. He is said to have crossed to the other shore; to have attained peace ... to have done away with all harmful influences. He is said to be free of the afflictions, master of himself, one whose everyday thinking is perfectly liberated and whose insight is perfectly liberated; one of noble origins, a mighty serpent, one who has done what is to be done, who has done what he had to do, who has done away with his burden, has fulfilled his own duty, has achieved the complete annihilation of the thirst for existence, whose mind is perfectly liberated by right practice, who has attained complete mastery over all thought. Such is called a sramana.’ Samadhiraja Sutra And so on.

Then there is this verse: ‘Those who have understood that the nature of desire, aversion, infatuation and delusion springs from a will engendered by falsity give up vain imaginings; for such there is not even renunciation in this world; they have fully realized the nature of all things.’

KALUPAHANA COMMENTARY

On the basis of the kind of discreteness referred to above, one cannot explain either the association or the nonassociation of lust and the lustful one. Avoid the sharp distinction, the problems are not there to solve. The same can be said in regard to all phenomena (dharma). For this reason, neither absolute identity nor absolute discreteness can establish the nature of phenomena.

GARFIELD COMMENTARY

10. As always, however, we must remind ourselves of the sense of the conclusion and of its dialectical context. There is no denial here of the possibility of simultaneity, of the existence of desire, or ‘of the possibility of desirous persons. Rather, there is a denial that any of these things make sense in the context of inherent existence.

Chapter VII: Examination of the Conditioned
Tsong-Kha-Pa (Outline, Explanation, Summary)

Outline:

We are in the section of the text explaining the refutation of the proof that there is a self of phenomena, and, having completed the first part of that section, which was the demonstration of selflessness in three phenomena, we are now in the second part of that section, which is the refutation of the argument that there is a self in phenomena. [154:12] This has three parts: We have finished the first part, which is the refutation of the defilements; and we now turn to the second part which is the refutation of the existence of the characteristics: arising, ceasing, and enduring; the third will be the refutation of the existence of the cause—agent and action.

Explanation:
This section has two parts: the presentation of the opponent’s view and its refutation.

SUMMARY:

It should be ascertained through argument that if arising, enduring and ceasing existed as they are grasped—that is, inherently, without being merely posited through nominal convention—the three could not be posited in any way. Thereafter one should practice as follows: They are completely tenable insofar as they are merely posited by nominal convention, and although all of the produced things are empty of inherent existence, their appearance in their respective guises should be taken like illusions and like dreams.

INADA (Chapter Introductions)

CHAPTER VII - Examination of the Created Realm of Existence

This is one of the more comprehensive chapters dealing with the interesting topic of the so-called compounded nature or created realm of existence. The Chinese title refers to this chapter as the examination of the three characteristics, i.e., origination (utpada), duration (sthiti) and cessation (bhanga), and thereby presents a clearer picture as to what the chapter discusses. The argument for the impossibility of maintaining the created realm is carried through by means of the three characteristics and with the same type of logic we have seen employed in Chapter II, i.e., with respect to the analysis of ganyamana, gata, and agata. Here again, each moment of the created realm, for example, the characteristic of origination, is taken up and the question is raised whether something prior or previous to it can be its cause. The advancement of a cause invariably breaks down because what has arisen does not require a cause nor does what has not arisen. This analysis is carried through with the other two characteristics of duration and cessation. The breaking up of entities into different moments is an impossibility and thus Nagarjuna states finally that the establishment of origination, duration and cessation is not possible at all and that there is no such thing as a created realm. His central position is clearly expressed in Verse 16: "Any thing (i.e., factor of existence) which exists by virtue of relational dependence is quiescence in itself. Therefore, presently arising and origination per se are likewise in the nature of quiescence."

KALUPAHANA (CHAPTER OVERVIEWS)

7. Conditioned (samskrta). The early discourses referred to three characteristics of the conditioned (samskrta). These were arising (utpada), change of what has come to endure (sthitasya anyathatva), and ceasing (vyaya). In a similar discourse, a definition of the “unconditioned” (asamskrta) is provided and, in this case, it is said that the three characteristics mentioned above are not evident. It was, therefore, easy for some of the later Buddhists to leap to the conclusion that the “unconditioned” is also uncaused or independent (apratityasamutpanna). This, evidently, was the intention of the Sarvastivada commentator, Yasomitra, when he stated that the terms “conditioned” (samskrta) and “dependent” (pratityasamutpanna) are synonyms. Yet, from other statements in the discourses, it is clear that this was not the case. For example, while the three terms anicca (impermanent), samskrta (conditioned), and pratityasamutpanna (dependent) occur together (though not as synonyms), to explain the nature of the world, 78 of their negative forms only abhuta and asamskrta (together with ajata, and akhra 79) are used to characterize nirvana. The negative form of pratityasamutpanna does not occur. For this reason, it can be maintained that the term samskrta has the specific meaning of “dispositionally conditioned,” and is not identical in meaning with the term pratityasamutpanna (“dependent”).

Not only did the Buddhist metaphysicians ignore this subtle distinction and considered the concepts of “conditioned” and “dependent” as being identical, they also explained the “conditioned” in terms of their metaphysical notions of substance and their speculative notion of temporality referred to earlier. Nagarjuna’s lengthy chapter on the subject of “The Conditioned” (Samskrta, VII) draws out all the implications of such metaphysics.

After rejecting the metaphysically conceived notions of arising (utpada) and along with it all other related concepts such as “the present arising” (utpadyamaṇa) and “non- arising” (anutpada), comparing all of them to the notions of “the moved” (gata), “the not moved” (agata) and “the present moving” (gamyamana) (VII.14) which he had previously criticized. Nagarjuna makes a very significant statement at VII. 16: “Whatever that comes to be dependently, that is inherently peaceful. Therefore, that which is presently arising as well as arising itself are peaceful.” In the first place, here there is no denial of arising (utpada) or that which is presently arising (utpadyamaṇa). By implication, there is no denial of cessation (vyaya) either. Secondly, there is no denial of “dependent arising” (pratityasamutpada) or that which is dependently arisen (pratitayad yad bhavati). On the contrary, there is a very significant assertion: “Whatever is dependently arisen is inherently peaceful.” Explaining the “elements” (dhatu) in a
previous chapter (V), Nagarjuna has shown how the belief in eternal existence (astitva, bhava) and nihilistic non-existence (nastitva, abhava) lead to the unfortunate consequences such as grasping (upadana) and, therefore, suffering (duhkha). The avoidance of such perspectives and the adoption of the view that things arise and pass away dependently (pratitya) were considered by the Buddha and the early Buddhists as well as Nagarjuna as being “inherently peaceful” (svabhavatah santam).

The significance of the use of the term svabhava in the above context should not go unnoticed. The term svabhava as well as its adverbial use, svabhato asti, especially when qualifying existence, was condemned by Nagarjuna throughout the work. However, in the present verse he was willing to use this very same term in an adjectival sense, qualifying santa (peaceful).

The concepts of “the conditioned” and “the unconditioned”, perceived in terms of substantial existence, are rejected here, and the notions of arising, duration, and ceasing, similarly conceived, are also abandoned as being illusory.

**BATCHelor (Poetic “Translation”)**

Birth

Were birth conditioned
It would be born and live and die
Like all conditioned things.
Were it unconditioned,
How could it describe
Conditioned things?

Does birth give birth
To itself and something else
Like light illuminates
Itself and something else?

Light illuminates
By shedding darkness;
Can light dispel
A dark it never meets?

Were darkness shed
By light it never meets,
A single lamp could lift
The darkness of a galaxy.

If light illuminates
Itself and other things,
Does the dark obscure
Itself and other things?

How can a child
That’s not yet born
Give birth to itself?

What has been born,
What’s not yet born
And what is being born
Do not give birth.

Everything contingent
Is naturally at ease.

When everyone is dying,
Can I be born and live?
Could I live,
But neither age nor die?

The living are not the dying
Nor the unliving the dying.
Neither milk nor butter
Causes milk to cease.

Something real would never die:
Something can’t be nothing.
Nothing too would never die:
You can’t behead a person twice.

**JONES (Commentary)**

7. The Conditioned

In Buddhist metaphysics, space and nirvana are considered “unconditioned.” Space in Indic cosmology is basically simply the absence of anything and so is unconditioned. Nirvana is considered unconditioned (25.9), even though attaining enlightenment requires our action because the final insight of enlightenment cannot be forced.

All other phenomena depend upon conditions and arise dependently. All conditioned things also have three characteristics: being impermanent, without a self, and open to suffering. But here Nagarjuna focuses on the fact that all conditioned things are constantly changing and that there are no entities that could arise, endure, and then cease. Real (self-existent) entities are unchanging and thus neither arise nor change to an enduring state nor cease from it - they exist.
eternally and without change. But what is dependently arisen and thus empty is not a “reality,” and thus there is nothing in a śūnyatā world to arise, endure, or cease. So, if we still see entities involved in the flow of arising and ceasing, we still see only from a conventional point of view – reality as it is (tattva) is free of differentiated entities.

Verses 1-3 are asking how arising could itself arise. If arising does not arise dependently, then this means that not all things arise dependently; but if it arises dependently, then the arising stage itself also has the three stages of arising, enduring, and ceasing. So, there is a prior “arising” upon which this arising is dependent (the arising of arising), and so on and so on - an infinite regress of beginnings and thus no actual beginning that would get anything started.

Verses 9-12 presents the problem that occurs if we think of darkness as an entity in its own right, not merely the absence of light. (See also W 34-39, but see VP 9 Comm.) If light destroys darkness, then there is nothing left to illuminate (v. 9). How does light destroy something it has not reached (v. u)? But how does the arising light reach an entity (v. 10)? And since it does not reach the entity “darkness,” it does not destroy it (v. 38).

From verse 14: what is currently arising, has already arisen, or has not arisen does not arise - so what can arise? What is currently arising does not start to arise a second time. The same is also true with ceasing (v. 26).

“Svabhavatas” in verse 16 means “by its own nature” or “inherently” in an everyday sense and without the accompanying metaphysical baggage of “svabhava” in the technical sense of “self-existence.” It is like Nagarjuna using “atman” to refer to oneself (10.15,27-4) without any implication of the metaphysically-loaded sense of a transcendental reality.

Whatever arises dependently is inherently pacified (shanta) (v. 16). From a conventional point of view, there are real entities, but from the point of view of what is real (tattvatas), there are no nonarisen entity anywhere that could arise.

Verse 22 says that what appears to endure is not in fact static over any period of time, no matter how brief. Nothing is changeless only even for a moment. Indeed, the cosmos does not endure even for an instant (R 63). Thus, it is not changeless realities and hence nothing is self-existent.

What is non-arisen cannot cease (v. 26) because it is either self-existent and so cannot cease, or it is empty and thus is not real and so there is nothing that could cease. A self-existent entity by definition cannot cease. Nor can we speak of an entity (bhava) and its absence (abhava) together (v. 30). A not-truly-existing entity (asat-bhava) (v. 31) is not the same as a nonentity (abhava). By definition, it has already ceased, and so cannot cease a second time.

When the conditioned cannot be established, the unconditioned cannot be established since the “unconditioned” is defined in contrast to the conditioned (v. 33). Both concepts then have nothing to apply to: either something is real and thus self-existent and thus not conditioned by anything; or everything is empty and thus there is no real entities that could be conditioned or unconditioned.

The image of a dream (v. 34) works for emptiness: a dream of a tiger is real and can have a real effect on the dreamer even though the tiger is unreal. Thus, what is empty is efficacious and real in that sense.
would exist on its own, by itself, objectively, without depending on anything else.

Here we are looking at arising, abiding, and ceasing. If these three truly existed, then arising would exist on its own without depending on any concept of ceasing. It would exist completely by itself. Abiding would also exist on its own, without depending on arising or ceasing. Finally, ceasing would exist independently, without needing any arising or abiding to occur. If it were really like that, then one could say that these things truly exist, that they have their own inherent nature. We can analyze, however, and see that each one of these three has to depend on the others for its existence. This is why the Middle Way explains that these things do not have their own nature, that they are empty of true existence.

This can be proven with logical reasoning in the following way: Arising does not inherently exist because it depends for its existence upon the cessation of its cause—if its cause does not cease, there can be no arising of any result, whatever it might be. Abiding does not inherently exist because it depends upon arising—abiding can occur only if something has arisen in the first place. Finally, cessation does not inherently exist because it can occur only if something has first arisen and then abided for some period of time. Thus, arising, abiding, and ceasing can exist only in mutual dependence—for one to exist the others must exist, but for those others to exist the first one must exist. They therefore do not truly exist; they are dependently arisen mere appearances.

Nagarjuna sums up the implications of this in the thirty-third verse:

_Arising, abiding, and ceasing do not exist, And therefore there are no composite things. Since composite things are utterly nonexistent, How could anything noncomposite exist?_

The defining characteristics of a composite phenomenon are that it arises due to causes and conditions, then it abides, and then it ceases. The defining characteristics of a noncomposite phenomenon are that it does not arise, abide, or cease (In There are three different noncomposite phenomena: space, the cessation that is the result of analysis, and the cessation that is not the result of analysis. The second refers to the absence of mental afflictions and suffering in the mindstream of an arhat who has realized the selflessness of the individual through analysis. The third refers to any cessation or absence of something that is not the result of the arhat’s analysis; in other words, all the ordinary instances of the nonexistence or cessation of things that occur in the world on an everyday basis. For example, the nonexistence of elephants on the moon is an instance of this third type of noncomposite phenomena. All three of these share the common trait of being the absence of things that arise, abide, and cease. Noncomposite phenomena do not arise, abide, or cease because there is nothing there to arise, abide, or cease. They are the opposite of the nonexistence of things that do arise, abide, and cease.).

If we put this verse in the form of a logical reasoning, we would say: Forms and so forth—all things that are composite—do not inherently exist because they do not arise, they do not abide, and they do not cease. It is accurate to say that there is no true arising, abiding, or ceasing because arising, abiding, and ceasing cannot exist inherently, but only in dependence upon each other.

Furthermore, noncomposite phenomena do not truly exist, because they depend for their existence upon composite phenomena, and composite phenomena themselves do not truly exist. Noncomposite phenomena do not arise, abide, or cease—they are the absence of arising, abiding, and ceasing. If these three activities do not exist in the first place, how could their absence exist?

In order to understand this better, think about a car in a dream. The car is the appearance of a composite phenomenon that arises, abides, and ceases, and the space inside the car is the opposite of that—it is a noncomposite phenomenon that neither arises, abides, nor ceases. If the dream car itself does not really exist, how could the space inside the car really exist? Both are just dependently arisen mere appearances.

This is something Nagarjuna explains in verse thirty-four, the last verse of the chapter—how it is not illogical for arising, abiding, and ceasing to exist as dependently arisen mere appearances that have no inherent nature:

_That’s how birth and that’s how living, That’s how dying are taught to be._

Dreams, illusions, and cities of gandharvas are all examples of “empty forms”—things that appear without having any real existence—and these examples help us to understand how it could be possible for something to appear vividly at the same time that it is not real in the slightest way.

Gandharvas are a type of spirit. They live together in large communities, and when you look at them from far away it seems as if there is a whole city of them, but once you get close to them, they seem to vanish. They are a very good example of the big cities we live in these days—when we do not analyze, there seem to be a great many people there, but as soon as we look more closely, we cannot find any one of them that truly exists. Therefore, all those people are just mere appearances, like gandharvas.

In his Guide to the Bodhisattva’s Conduct, the bodhisattva Shantideva teaches:

_Then wanderers, these dreamlike beings, what are they? If analyzed, they’re like a banana tree— One cannot make definitive distinctions Between transcending misery and not._
Sentient beings who wander in samsara are like sentient beings who appear in dreams. Once we analyze, we find that they are like banana trees—when you look at a banana tree, it seems solid, but once you peel away the layers of its bark, you do not find any core. The bodies of sentient beings are the same—they appear to be solid, truly existent things, but we can apply the analysis of composite entities that we have undertaken in this chapter to sentient beings’ bodies as well and find that they are not truly existent after all, that they have no real substance, because they do not really arise, abide, or cease. Thus, sentient beings are illusory appearances.

In the Mahayana, the meditation that one practices in between formal meditation sessions is called the samadhi that sees everything to be like an illusion. \textit{(In \textit{Samadhi} refers to a state in which one is concentrated and not distracted. Paradoxically, it seems, the samadhi that sees everything to be like an illusion is the meditation one practices in the midst of all the distractions of thoughts and the objects that appear to the senses. When one remembers that all of these distractions are illusory, however, this constitutes the practice of this samadhi, and all the distractions are in fact friends of and enhancements to the meditation rather than hindrances or obstacles.)}. In the Vajrayana, this is called impure illusory body practice. The names are different, but the instructions for practicing them are the same: View all appearances of forms, sounds, smells, tastes, tactile sensations, and thoughts as appearing while empty, empty while appearing; understand all your experiences to be the union of appearance and emptiness, like illusions and dreams.

These days, the samadhi that sees everything to be like an illusion is easier to practice than ever before, because modern technology has produced so many new examples of empty forms. Movies, television, telephones, faxes, e-mail, the internet—all of these are wonderful examples of how things can appear due to the coming together of causes and conditions, while at the same time being empty of any inherent nature. In big cities, there are all kinds of flashing lights and moving billboards outdoors, and when you go into any big department store, there are huge mirrors on the walls, filled with reflected images. So the city is a wonderful place to train in the samadhi of illusion.

GARFIELD COMMENTARY

Chapter VII Examination of the Conditioned

Having begun the text with an examination of the relation of dependency between phenomena, and having then conducted an analysis of the fundamental ontological constituents of reality, Nāgārjuna now brings these two analyses together in a long chapter investigating the nature of the world of conditioned things as a whole. The target position is the view that dependent arising itself, as well as dependently arisen things, are either inherently existent or completely nonexistent. There are really two positions here with which Nāgārjuna must contend: First, the reificationist opponent charges that even if we grant Nāgārjuna’s earlier arguments for the conclusion that phenomena themselves are empty because they are dependently arisen, dependent arising itself must inherently exist. For only if phenomena are truly dependently arisen, one might argue, are they truly empty. Second, Nāgārjuna must answer the following objection: If dependent arising is empty, then arising, stasis, and cessation are nonexistent. Hence there are, in fact, no phenomena since phenomena are defined - particularly in a Buddhist context - as those things that arise, remain, and cease. But clearly there are actual empirical phenomena; indeed, such phenomena must exist for Nāgārjuna’s claim that they are empty to make any sense at all. How can this be reconciled with the emptiness of dependent arising?
Kārikā VII.1

INADA (Skt):
Verse 1 - If origination is of the created nature, then the three characteristics (i.e., origination, duration, cessation) will prevail. But if origination is of the uncreated nature, how could it be a characteristic of the created?

JONES (Skt):
[1] If the arising of phenomena were conditioned, then the arising would itself have the three characteristics of conditioned things - arising, enduring, and ceasing. If the arising were not conditioned, how could it be a characteristic of anything conditioned?

KALUPAHANA (Skt):
If arising is conditioned, therein three characteristics are proper. If arising is unconditioned, how can there be characteristics of the conditioned?

MCCAGNEY (Skt):
If arising is conditioned, then possessing three marks is entailed [origination, duration, destruction]. But if arising is not conditioned, how is it a mark of the conditioned?

NISHIJIMA (Skt?):
1. When this world has appeared, There might be the three kinds of manifestations, that is, appearance, continuity, and disappearance. In such situations this world is just appearance, And how is it possible for this world to have any kind of symbolic image?

STRENG (Skt):
1. If origination (utpada) is a composite product, then the three characteristics of existence: "origination," "duration," and "dissolution" are appropriate. But if origination is a non-composite (asamsrtra), then how could there be characteristics of a composite product?

ROBINSON (Skt):
If arising is conditioned, then it must have the three marks; if arising is unconditioned, how can it be a mark of the conditioned?

BOCKING (Ch), 7v1 If ‘arising’ is active Then it should have the three marks If arising is not active How can you call it a mark of the active?

BATCHelor (Tb):
If birth were compounded, it would possess the three characteristics [of a compound]. If birth were uncompounded, how would it be a characteristic of a compound?

DOCTOR (Tb):
If arising were conditioned, It would possess these three characteristics. If arising were unconditioned, How could it be a characteristic of the conditioned? [VII.1]

GARFIELD (Tb):
1. If arising were produced, Then it would also have the three characteristics. If arising is not produced, How could the characteristics of the produced exist?

GARFIELD-SAMTEN (Tb):
1. If arising were produced It would also have the three characteristics. If arising were unproduced, How could it be the characteristic of the produced?

HAGEN (paraphrase):
If arising is conditioned, therein three characteristics are proper. If arising is unconditioned, how can there be characteristics of the conditioned?
PINGALA COMMENTARY

7/1 If arising is active, it ought to have the three marks of arising, abiding and ceasing, but this is not correct and why? Because these (three) are mutually opposed. 'Mutually opposed' means that the mark of arising should cause dharmas to arise, the mark of abiding should cause dharmas to abide, and the mark of cessation should cause them to cease. When a dharma is at the point of arising, there should not be present the opposing dharmas, the marks of abiding and cessation. Simultaneity (of these marks) is thus incorrect, in the same way that light and darkness do not coexist. Therefore 'arising' cannot be an active dharma, and the same applies to the marks of abiding and ceasing.

(9a19) Question. If arising is not active, what is wrong with saying that it is inactive?

Reply. If arising were inactive, how could it possibly operate as marks of active dharmas? Why is this? It is because inactive dharmas have no nature. It is because of the cessation of activity that they are called inactive, and indeed this is why we speak of non-arising and non-ceasing as the marks of the unconditioned. Moreover, they have no own-mark, and therefore they are non-dharmas and cannot operate as the marks of dharmas, just as a rabbit's horns - or a tortoise's hair etc. cannot operate as the marks of dharmas. Therefore arising is not inactive, and the same goes for abiding and ceasing.

KALUPAHANA COMMENTARY

The examination of the "conditioned" (samskrta) coming immediately after the analysis of lust (raga) and the lustful one (rakta) brings out another important aspect of the Buddha's conception of the pragmatic meaning of truth, a conception that Nagarjuna seems to be clearly aware of.

Lust, as pointed out earlier, is one of the most important elements in the Buddha's analysis of experience. Lust is operative in the perceptual process especially in the formation of ideas derived from experience. Having rejected "omniscience" (sarvajnatva) as a source of knowledge, the Buddha depended primarily on sense experience. However, for him, seine experience was a "big, blooming, buzzing confusion. One way of dealing with this confusing mass of seine data is by concentrating upon items that are of interest to the individual and then forming ideas. Such selection is generally based upon one's interest. This is the significance of "dispositions" (samskara = compounding of ideas). For the Buddha, one's conception of truth is invariably bound up with such dispositions. Therefore, all ideas are "dispositionally conditioned" (samskrta). The Buddha's final statement before his death: "Dispositions are subject to change" (vayadhamma sankhara, D 2.156), therefore, is an assertion that, since ideas are impermanent, there can be no absolute truth. However, the above conception of the "dispositionally conditioned" (samskrta) was to undergo a radical change at the hands of the Buddhist metaphysicians. Nagarjuna's examination of samskrta becomes meaningful only in the background of that change of perspective. His was, indeed, an attempt to reject the Sarvastivada and Sautrantika interpretations of samskrta (and this would apply to the ideas that came to be accepted by the later Theravadins) and to revert back to the original teachings of the Buddha.

Once again, the Sarvastivada school was responsible for initiating this change of perspective. In the early discourses, the term samskrta is used along with the term prati tyasamutpanna, but not as synonyms (S 3.96,103). While the former implied "the dispositionally conditioned," the latter was used in the more comprehensive meaning of "the dependent." Thus, all dispositionally conditioned phenomena are dependent, but not all dependent phenomena are dispositionally conditioned. The equation of samskrta and prati tyasamutpanna occurs for the first time in the interpretation of the Abhidharma. It was this latter tradition that Vasubandhu was recording when he said: "Those that are made by the conditions having come together are called the samskrtas" (sametya sambhuya krta iti samskrta, Akb ; see also AA 2.252, paccayehi samagantva katassa). The Sarvastivadins seem to have understood the concept of samskrta as a mere refutation of the belief in the production of an event by a single cause (eka-pratyaya-janitam, ibid.). Yasomitra, commenting upon this statement, goes on to say that samskrta and prati tyasamutpanna are, therefore, synonyms (Sakv p-172), thereby obliterating the semantic difference between "made" (krta) and "arisen" (utpanna).

This erroneous simple equation was to lead to further complications, especially in understanding the Buddha's characterization of nirvana as asamskrta. Even though the early discourses presented nirvana as an asamskrta, it was never considered to be an aprati tyasamutpanna ("independent"). For early Buddhism, both samskrta and
asamskrta are prati tyasamutpanna. However, the Sarvastivada equation led to the equation of their negations as well. Asamskrta seems to have been understood in the sense of aprati tyasamutpanna. To what extent their perspective was dominated by an adherence to the notion of self-nature (svabhava), for which they gave no causal explanation at all other than merely maintaining that it is permanent, remains a surmise.

It is this Sarvastivada conception of samskrta as being identical with prati tyasamutpanna that is being criticized at VII. 1. Nagarjuna, as indicated in the first line of this verse, had no difficulty in assuming that the samskrta is characterized by arising, change, and ceasing. This indeed was a statement attributed to the Buddha in the early discourses, where it is said: "Monks, there are these three characteristics of the dispositionally conditioned. The arising of that which is dispositionally conditioned is evident. Its cessation is also evident. Change of what has come to endure is also evident," (A 1.152). Yet if, as explained by the Sarvastivadins, samskrta is identical with prati tyasamutpanna (the latter also accounting for arising, change and ceasing), then one cannot speak of these three characteristics in the context of the asamskrta. It may be of interest to note that it is not only nirvana that came to be included in the category of asamskrta by these metaphysicians. They also admitted "space" (akasa) as an asamskrta. The implications of that view was examined by Nagarjuna in Chapter V.

**GARFIELD COMMENTARY**

1. (fn 52. "du byed"... This term is sometimes appropriately translated as "disposition," "action," or "compounded." Context is crucial in determining which rendering is best. In Buddhist metaphysics these meanings are closely connected. Kalupahana (1986) uses "conditioned," though he interprets this to mean "conditioned by dispositions." He argues that this chapter is closely connected to the previous chapter in that lust "is operative in the perceptual process especially in the formation of ideas derived from experience." He argues that this chapter is devoted to an examination of the way phenomena such as desire determine the formation of ideas from "the blooming, buzzing confusion" of sense experience (p. 159). I find this reading unsupported by the text.)

The three characteristics in question are arising, stasis, and cessation. On a standard Buddhist view, all phenomena come into being in dependence upon conditions, remain in existence dependent upon conditions, and cease to exist dependent upon conditions. This is the core of the two central doctrines of dependent arising and impermanence. Nāgārjuna here poses a problem: If dependent arising itself were produced by conditions, then it itself would have these three characteristics and, apparently paradoxically, be impermanent. This is prima facie paradoxical just because if dependent arising is impermanent, it would appear that sometimes things don’t arise dependently, which contradicts the thesis that all phenomena are dependently arisen. Moreover, as Nāgārjuna will argue below, this assertion threatens a vicious regress - if arising arises, there must already be arising in virtue of which it does so. But, Nāgārjuna asks in the third and fourth lines, if dependent arising is not produced, where did it come from? If one were to say that dependent arising were not produced and, hence, that it does not depend for its existence on anything else, this would appear to contradict the thesis that everything arises dependently. Dependent arising itself would then be the counterexample to the thesis.
Kārikā VII.2

utpādādyās trayo vyastā nālaṃ lakṣaṇakarmanī
saṃskṛtasya samastāḥ syur ekatra katham ekadā ||2||

三相若聚散 不能有所相
云何於一處 一時有三相

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 2 - When the three characteristics of origination, etc. are
discrete, there will be no action in the characteristics with
respect to the created nature. And if they are compounded
or united, how could they occur at the same time in the
same place?

JONES (Skt):
[2] The triad of arising, enduring, and ceasing cannot function
separately as characteristics of anything conditioned. But
how could they be together in the same place at the same
time?

KALUPAHANA (Skt):
When the triad consisting of arising, etc. are discrete, they
are not adequate to function as characteristics of the
conditioned. If they were to be combined, how can they
be in the same place at the same time?

MCCAGNEY (Skt):
When the three, origination, etc., are separated, they are not
sufficient for the functions of the marks of conditioning.
If they were combined, how would they occur at one place at
one and the same time?

NISHIJIMA (Skt?):
2. The appearance, and so forth, that is the three, appearance,
continuity, and disappearance, are separated into pieces,
Are not so satisfactory even though relying upon many kinds of
characteristics.
The total situations of the world might be belonging to the world,
And it might be only at one place, but why does it exist just at one
moment?

STRENG (Skt):
2. When the three are separate, origination of either of
the other two characteristics does not suffice to
function as a characteristic. If united in a composite
product, how could they all be at one place at one
time?
7/2 Whether (you say that) these marks of arising, abiding and ceasing can operate as the marks of active dharmas individually, or they operate as the marks of active dharmas by acting in combination; neither is correct, and why? You may say that they operate individually; but in any one place either there exists a mark or there does not exist a mark. When something is arising, there (should be) no abiding or ceasing. When it is abiding there should be no arising or ceasing. When it is ceasing there should be no arising or abiding.

You may say that they operate in combination; but they are mutually exclusive. How can you say that they exist simultaneously? If you say that the three marks themselves have three marks, this is incorrect too, and why?

Further objections to the Sarvastivada and Sautrantika theories relating to the characteristics of the conditioned are raised here. The discreteness of the three characteristics, as envisaged by these two schools, would not allow them to function as the characteristics of the conditioned. The Sarvastivada theory of an underlying substance, which comes to be superficially characterized by the three (or four) moments, as well as the Sautrantika theory that each moment is inherent in the previous one in the form of potentiality or seed (sakti, bija), were the direct results of such a perspective. Furthermore, if these characteristics were distinct in relation to both time and space, they could not occur in any one samskṛta at the same time.

These three characteristics, if they characterize the phenomenon of dependent arising itself, must either be present separately or together. This furnishes the basis of a destructive dilemma. If they are separate, then some parts of dependent arising have one of the three; some another. Some are arising; some abiding; some ceasing. But this is problematic since all phenomena are said to arise, to abide, and to cease. (In 53.) Moreover, one would not want to say that sometimes dependent arising is arising, sometimes abiding, sometimes ceasing. The whole Buddhist picture of impermanence is one according to which these processes are always co-occurring. But this dialectical move is not available to Nāgārjuna at this stage of the discussion. It would beg the question in, a critical sense: The properties under analysis here, as well as dependent arising itself, are introduced by the opponent as candidates for inherent existence and as components of an analysis of the ultimate nature of phenomena. In the sense that they are deployed in a positive Buddhist account of the nature of conventional reality - the sense in which all phenomena are constantly arising in some sense, abiding through change in another, and ceasing in yet another - neither the phenomena to which these predicates are applied, nor the properties ascribed, are inherently existent. Quite the contrary; this is an analysis that is designed to demonstrate the lack of inherent existence of phenomena and their characteristics. It is important throughout the discussion that follows to bear in mind that Nāgārjuna is not subjecting this view to criticism, but its substantialist cousin. So it would seem to be the case that if dependent arising itself has all three of these characteristics, it cannot have them separately, but must have them jointly and simultaneously. But the three characteristics could not be present simultaneously since they are mutually contradictory. At any one point, dependent arising could have only one of them. The same thing cannot be - in the same sense, at the same time - arising and ceasing when these are understood in the sense at issue here, that introduced by the substantialist opponent. It is important in order to understand this argument to keep the dialectical context firmly in mind. The opponent throughout the text, whether on the nihilist side or on the reificationist side, considers existence to be inherent existence and predication to be the ascription of really existent properties to substantial bases. For the opponent Nāgārjuna has in mind here, dependent arising - if it is the nature of things at almost inherently exist. It must therefore have the three characteristics inherently. To have a characteristic inherently is to have it essentially. But then dependent arising, for the opponent, would have a contradictory set of essential properties.
Kārikā VII.3

If arising, abiding, and ceasing
Themselves possess the marks of the active
This, if so, would make for an endless (regression).
If not, they would not be active.

INADA (Skt):
Verse 3 - If other characteristics of the created nature besides that of origination, duration and cessation are permitted, then this process (of assigning characteristics) could go on ad infinitum. If they are not permitted, on the other hand, then they are not of the created nature.

JONES (Skt):
[3] If there were further conditioned characteristics to arising, enduring, and ceasing, there would be an infinite series (i.e., an infinite regress of each - the arising of arising, and so forth) - but if there were no such characteristics, they would not be conditioned.

KALUPAHANA (Skt):
If there were to be a characteristic of the conditioned other than arising, duration, and destruction, there would be infinite regress. If there were to be no such [characteristics], these would not be conditioned.

MCCAGNEY (Skt):
If there are other marks of conditioning than those of origination, duration, and destruction, there is an infinite regress. If there is not, then they are not conditioned.

NISHIJIMA (Skt?):
3. Appearance, maintenance, and destruction,
And in another expression this world is just a kind of characteristics.
When an unstable world really exists as this world,
Then any world, which is different from this world, can never exist actually at all.

STRENG (Skt):
3. If origination, duration, and dissolution are other secondary characteristics of composite products, It is an infinite regress. If this is not so, they are not composite products.
PINGALA COMMENTARY

7/3 If you say that arising, abiding and ceasing themselves have the marks of active (dharmas), then arising itself would have an arising, an abiding and a ceasing, and these three marks would again each have their own marks, and if this were so it would be endless. If, on the other hand, you say that they have no marks themselves, then these three marks ought not to be called active dharmas, and they will be unable to operate as the marks of active dharmas.

Question. You state that the three marks would lead to an endless regression, but this is not correct. Although arising, abiding and ceasing are active, there is no endless regression. Why is this?

KALUPAHANA COMMENTARY

If arising, stasis, and ceasing are three distinct events, then each one of these will require further characteristics of arising, stasis, and ceasing to account for themselves. Thus, the moment of arising will need three further characteristics of arising, stasis, and ceasing before it could give rise to the next moment, namely, stasis. The same applies to stasis and ceasing. This will lead to infinite regress (anavastha). On the contrary, if each of these moments do not possess further characteristics, then they cannot be defined as the conditioned.

GARFIELD COMMENTARY

3. The other possibility is that dependent arising has some other characteristics - that is, characteristics other than those that all phenomena have in virtue of being dependently arisen. But we could then ask about the characteristics of those characteristics. Do those characteristics arise, abide, or perish? If so, the original regress has not been stopped. Another possibility is that arising, abiding, and perishing do not have characteristics at all. But if not, then they are not phenomena in any ordinary sense at all. While that would cut off the regress, it would do so without achieving any explanation, or any analysis of the kind originally sought, and would leave an uncomfortable paradox: We started seeking an understanding of dependent arising as inherently existent. But its inherent existence requires the inherent existence of arising, cessation, and stasis, all of which now come out to be ontologically sui generis. The further paradox is this: For dependent arising to exist inherently, these three should turn out to be essential properties of all phenomena. But on the alternative under consideration, they are not properties at all.

We might, of course, try to extend this horn of the dilemma by suggesting that although arising, abiding, and ceasing are not phenomena in the ordinary sense, they are characteristics of some special kind. We then seem to have a more curious regress; new ad hoc characteristics arise at each level of analysis. The regress here is an interesting one because its viciousness consists not in the same basis being required for each putatively basic posit, but in there being no principle available to determine a basis for any putative basic posit despite a principle that urges that there must be one. The point that Nāgārjuna is after, of course, is that this principle itself - that there must be an explanatory basis, an independent entity that has characteristics, as an explanation of the occurrence of any characteristics what generates the regress and must be rejected.

There is, of course, a third alternative. These three might neither have characteristics different from those possessed by ordinary phenomena nor have no characteristics at all: They might indeed have the very trio of characteristics that all ordinary phenomena have, namely, arising, abiding, and ceasing. It is this alternative that occupies Nāgārjuna for the remainder of the chapter. This alternative is interesting dialectically in that, on the one hand, it represents the most natural way to approach an analysis of dependent arising, namely, by consistently predicating it of everything, hence suggesting that it is indeed a candidate for an essence of things. On the other hand, as we shall see, that very move precludes treating it as a genuine essence since essences turn out to lack precisely the properties that we must universalize here.
INADA (Skt): 
Verse 4 - The origination of origination is nothing but the arising of the primal origination. And of course the primal origination gives rise to the origination of origination.

JONES (Skt): 
[Objection:4] The “arising of arising” only gives rise to the “initial arising.” The initial arising only produces the arising of arising.

KALUPAHANA (Skt): 
The arising of arising is exclusively the arising of primary arising. Again, the primary arising produces the arising of arising.

MCCAGNEY (Skt): 
Origination is the arising of arising, the isolated beginning of origination. Again, origination is caused to arise by the aboriginal arising of arising.

NISHIJIMA (Skt?): 
4. Appearance, appearance, and appearance, The idea, which belongs to a fundamental appearance, may be individual and isolated. Appearance produces appearance, and that is called appearance. The fundamental might be born also in the similar case after.

STRENG (Skt): 
4. The "originating origination" (utpadotpada) (i.e. the beginning of the origination) is only the origination of the basic origination (mulotpada) (i.e. the beginning of the product); Also the origination of the basic origination (i.e. the beginning of the beginning of the product) produces the "originating origination." (i.e. the beginning of the origination)

BOCKING (Ch): 
7v4 That which arises in the arising-of-arising Produces another 'original arising'. What arises in that original arising Produces the arising of arising in return.

BATCHelor (Tb): 
The birth of birth gives birth to the root birth alone. The root birth also is that which gives birth to the birth of birth.

DOCTOR (Tb): 
Due to the arising of arising, There arises only fundamental arising, Yet fundamental arising is responsible For the arising of arising as well. [VII.4]

GARFIELD (Tb): 
4. The arising of arising only gives rise To the basic arising. The arising of the basic arising Gives rise to arising.

GARFIELD-SAMTEN (Tb): 
4. The arising of arising only gives rise To the basic arising. The arising of the basic arising Gives rise to arising as well.

HAGEN (paraphrase): 
The arising of arising is exclusively the arising of primary arising. Again, the primary arising produces the arising of arising.
PINGALA COMMENTARY

7/4 When a dharma arises, seven dharmas, including the dharma itself, arise together: (1) the dharma, (2) arising, (3) abiding, (4) ceasing, (5) arising-of-arising, (6) abiding-of-abiding, (7) ceasing-of-ceasing. In these seven dharmas original arising can produce the six dharmas excepting itself. Arising-of-arising produces original arising, and original arising produces arising-of-arising. Thus the three marks, though active, are not an endless series.

Reply:

KALUPAHANA COMMENTARY

In order to avoid infinite regress, one may assume that the arming of arising is the primary arising (mulautpada), and that this latter again causes the arising of arising. Such mutual action on the part of primary arising and arising of arising could eliminate infinite regress.

GARFIELD COMMENTARY

4. This is the opponent speaking. He suggests that dependent arising arises from a more basic arising. This basic arising comes to be, but not on the basis of anything else. The idea, defended by some earlier Buddhist schools, is this: There are two levels of dependent arising. The more superficial is the relationship of mutual dependence of all phenomena, issuing in their impermanence. But this interdependence, on this view, is itself dependently arisen. It depends on a basic arising - a mere fact of interdependent origination, which gives rise to the more specific empirical relations we see. So in 'the first two lines of this verse, the opponent says that when arising itself is considered in isolation, all that we have is the basic arising. In the third and fourth lines, the opponent says that when that arising has arisen, it gives rise to the more superficial ordinary dependent arising. It is, then, that basic arising that is posited as ontologically foundational.
Kārikā VII.5

उत्पादोत्पाद उत्पादो मूलोत्पादस्य ते यदि।
मौलनाजनितस्त्ते स कथं जनविष्यति॥५॥

若謂是生生 能生於本生
生生從本生 何能生本生

ENGLISH TRANSLATIONS

INADA (Skt): Verse 5 - If you say that the origination of origination is the arising of the primal origination, then how could it give rise to the primal origination, when it depends on the latter (for its own being) and has not yet arisen?

JONES (Skt): [Reply:5] If the “arising of arising” is the arising of the initial arising, then it has not arisen from the initial arising - how then can what is not yet produced by the initial arising produce it?

KALUPAHANA (Skt): If arising of arising is the primary arising, not being produced by the primary, how can it [the former] produces that [the latter]?

MCCAGNEY (Skt): If origination is the arising of arising, it is the source of arising for you. How, for you, will it arise out of what has not arisen aboriginally?

NISHIJIMA (Skt?): 5. Appearance, appearance, and appearance. If those appearances belong to the fundamental, How is it possible for the fundamental, which doesn't have any birth, to be born? And so how is it possible for such a conversation to be born even in future?

STRENG (Skt): 5. But if, according to you, the originating origination (i.e. self-originating origination) produces basic origination, (i.e. also causes the beginning of the product) How, according to you, will this originating origination (i.e. self-originating origination) produce that basic origination (i.e. the beginning of the product) if it itself is not produced by basic origination (i.e. the beginning of the product)?

ROBINSON (Skt): If there is another conditioned-mark of arising, abiding and perishing, then there is an infinite regression; if there is no [other], they are not conditioned.
PINGALA COMMENTARY

7/5 If the arising of arising can produce original arising, then such an arising-of-arising cannot be said to have arisen from original arising, and why? If arising-of-arising arises from original arising, how can it produce original arising? Furthermore,

KALUPAHANA COMMENTARY

The question raised here by Nagarjuna pertains to active causation. The substantialist (Sarvastivada) view of causation, which assumes the essence of the effect to be already latent in the cause, does not permit mutual dependence of cause and effect. In such a case, the cause-effect relationship would be a one-way relationship. Nagarjuna perceives that the interdependence utilized in VII.4 in order to avoid infinite regress would not be appropriate in the context of a substantialist theory of causation.

GARFIELD COMMENTARY

5. But Nāgārjuna makes the obvious move in reply: Does the basic arising arise from a more basic arising, or is it somehow unarisen (eternal or inexplicable)? If the former, then we seem to have an infinite regress; if the latter, a petitio principii. Nāgārjuna makes some of the numerous difficulties that afflict this view explicit in the next two verses:
INADA (Skt):
Verse 6 - If you say that that which depends on the primal origination gives rise to the primal origination, then how could it give rise to the primal origination which in turn depends on the origination of origination and which has not yet arisen?

JONES (Skt):
[6] If what is produced by the initial arising gives rise to the initial arising, how does the initial arising give rise to it?

KALUPAHANA (Skt):
If, produced by the primary, it produces the primary, how can that primary, not produced by it, produce it?

MCCAGNEY (Skt):
If what has arisen out of the aboriginal is, for you, given rise to by the aboriginal, how does the aboriginal occur out of that which has not arisen.

NISHIJIMA (Skt?):
6. Actually those are born relying upon fundamental, And at that time the fundamental will be born.
But, however, the fundamental is not born relying upon the individual, And so how is it possible for a concrete fact to be born actually?

STRENG (Skt):
6. If, according to you, that which has originated through basic origination (i.e. referring to the dependent originating origination) produces basic origination, (i.e. like affirming that the effect exist before the cause) How does the basic origination, which is yet un-produced by that originating origination (i.e. self-originating origination), cause that originating origination (i.e. self-originating origination) to be originated?

BOCKING (Ch):
7v6 If, as you say, original arising Can produce arising-of-arising Then, original arising arising from it, How could it produce arising-of-arising?

BATCHelor (Tb):
If that which is born from your root birth gives birth to the root, how does that root which is born from that give birth to that [from which it is born]? [VII.6]

DOCTOR (Tb):
If the product of this “fundamental arising” Itself produces fundamental arising, Then how could fundamental arising produce it, When it has not been produced by that? [VII.6]

GARFIELD (Tb):
6. If, as you say, that which is arisen from basic arising Gives rise to the basis, How does that nonarisen basis Give rise to it?

GARFIELD-SAMTEN (Tb):
6. If, as you say, that which is arisen from basic arising Gives rise to the basic arising, How does that basic arising, to which it has not given rise, Give rise to it?

HAGEN (paraphrase):
If, produced by the primary, it produces the primary, how can that primary, not produced by it, produce it?
PINGALA COMMENTARY

7/6 If you assert that original arising is able to produce the arising-of-arising, then this original arising cannot be said to arise from the arising-of-arising, and why? Because original arising arises from the arising-of-arising. How can it produce arising-of-arising? The dharma of the arising-of-arising is supposed to produce original arising, yet the arising-of-arising cannot now produce original arising. When arising-of-arising has not yet acquired its own self-substance how can it produce original arising? Hence original arising cannot produce arising-of-arising.

Question. It is at the moment of arising of arising-of-arising, neither before nor after, that it can produce original arising. Just at the moment of arising of arising-of-arising it can produce original arising ...

Reply. Not so, and why?

KALUPAHANA COMMENTARY

Here again, Nagarjuna refuses to recognize the mutual dependence of cause and effect in the context of an active or substantialist theory of causation.

GARFIELD COMMENTARY

6. The account is either circular or regressive. If the basic arising is held to arise in dependence on other dependently originated phenomena, and dependent arising is explained as dependent upon the basic arising, then the basis is posited as dependent upon that which it explains, and we have a vicious circle. If on the other hand the phenomena on which the basis depends are other than those it explains, and the phenomena themselves depend upon yet another basis, we have a vicious regress.

In the next verse, Nāgārjuna points out the question - begging alternative reading of the enterprise. He notes that one may explain that dependent arising arises through basic arising without circles or regresses, but only by positing the basis as itself nonarisen. This, of course, flies in the face of the demand that motivates positing it in the first place - namely, the demand that every phenomenon, including dependent arising, be explained by some ontologically more fundamental phenomenon:
Kārikā VII.7

ayam utpādyamānas te kāmam utpādayed imam |
yadīmam utpādayitum ajātah śaknuyād ayam ||7||

ruò shēng shēng shēng shí néng shēng yù; yù wū bēn shēng shēng shēng shāng wèi yòu hé néng shēng bēn shēng
| gal te ma skyes pa de yis | | de (5a1)skyed par ni byed nus na | |
| khyod kyi skye bźin pa de yis | | de skyed par ni ’dod la rag |

ENGLISH TRANSLATIONS

INADA (Skt): Verse 7 - This so-called presently originating will, as you wish, cause an origination if that which has not arisen is capable of causing such an origination.

JONES (Skt): [Objection:7] If something, while arising, can give rise to something else, It can give rise to what is not yet arisen.

KALUPAHANA (Skt): This, while arising, if it may so desire, produce that, so that it, being not yet born, will be able to produce that.

MCCAGNEY (Skt): This present arising, for you, intends that which would arise unless this was able to not give rise to that which is to arise.

NISHIJIMA (Skt?): 7. Those things and phenomena are manifesting as they are, And so what is hopeful is to manifest this here. And they are just this one, which is manifested as miscellaneous things and phenomena, totally They haven’t been born, transcending verbal expressions, that is just this world.

STRENG (Skt): 7. According to you, this, while originating, would certainly cause that to originate— If this, not being produced, would be able to cause origination.

BOCKING (Ch): 7v7 If at the moment when arising-of-arising arises, It can produce original arising. Arising-of-arising not yet existing, How can it produce original arising?

BATCHelor (Tb): If that which has not been born is able to give birth to that, that of yours which is being born should be able to give birth to that.

DOCTOR (Tb): If that which has not yet arisen Were capable of production, Your assertion of production by the currently arising Would have been acceptable. [VII.7]

GARFIELD (Tb): 7. If this nonarisen Could give rise to that, Then, as you wish, It will give rise to that which is arising.

GARFIELD-SAMTEN (Tb): 7. If this non-arisen Could give rise to that, Then you will have to accept Things in the process of arising giving rise to each other.

HAGEN (paraphrase): This, while arising, if it may so desire, produce that, so that it, being not yet born, will be able to produce that.
PINGALA COMMENTARY

7/7 It could perhaps be, as you say, that—at the moment when arising-of-arising arises it can produce original arising—but in fact it would not yet exist. Therefore, at the instant when arising-of-arising arises, it is impossible for it to produce original arising.

Further.

KALUPAHANA COMMENTARY

At this point Nagarjuna proceeds to state the Sautrantika theory of causation, which is described very succinctly by Vasubandhu (Akb p). The Sautrantikas believed that the Buddha’s discourse on the three characteristics of existence—arising (utpada), change of what has endured (shtubasyanyathatva), and ceasing (vyaya)—was intended for the foolish people who are blinded by ignorance (avidyandhabalah). According to them, the recognition of such characteristics involves the belief in the substantial existence (astitva) of the “conditioned” (samskrta) (see ibid.,). However, these three characteristics are not part of reality which consists of momentary (ksanika) events. Such momentary events or impressions coming one after another in rapid succession (purvasy purvasyottaraksanasyanubandhab) produces the appearance of “change of what has endured” (sthityanyathatva), whereas it is merely a series of events (pravaha) resembling one another (avisadrasa). In such a context, arising is merely the immediate arising from a state of non-existence (pratiksanam abhutva bhava utpadah). A moment thus comes to be from nowhere and ceases immediately. (Here one is naturally reminded of the Humean version of causal relations.)

In the present verse, Nagarjuna is providing his own description of the Sautrantika theory of change. As this theory is based upon the recognition of momentariness (ksanikatva), Nagarjuna insists that the preceding event has to produce the succeeding event (in the series of similar events) even before the former is born, for the former does not endure in order to produce the latter. In other words, if there were to be any causal connection between two momentary events, the moment that serves as the cause should be ready to generate the effect before it passes away, that is, even before it is born.

GARFIELD COMMENTARY

7. The opponent now suggests another reply. Using the analogy of a lamp that illuminates both itself and others, he argues that arising can give rise to itself and to others. This would, from the standpoint of the reificationist, have the happy consequence that while other phenomena would be dependent on dependent arising, dependent arising would be independent and nonempty:

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 8 (The opponent contends) As light illumines both itself and other entities, so does origination give rise to both itself and others.

JONES (Skt):
[8] As the light from a lamp illuminates both itself and another, so arising can give rise to both itself and other arisen things.

KALUPAHANA (Skt):
As a light illuminates itself as well as others, so does arising produce both itself and others.

MCCAGNEY (Skt):
As light causes illumination of itself as well as others so arising would give rise to itself as well as others.

NISHIJIMA (Skt?):
8. What is called "light", is including both subjective idea and objective sense perception.
And so it manifests itself following the method of the subjective consideration and the objective perception.
A fact that something manifests itself is the manifestation of both the subjective meaning and the objective form,
And relying upon such a combination of the two factors, the combinations of the two become possible.

ETTETT

STRENG (Skt):
8. The opponent claim: As a light is the illuminator of both itself and that which is other than itself, So origination would originate both itself and that which is other than itself.

BOCKING (Ch):
7v9 Just as a lamp can illumine itself
And also illumine others.
So, in the same way, the dharma of arising Produces itself and produces other things.

BATCHelor (Tb):
Just as lamplight illuminates itself and others, likewise birth too gives birth to both itself and the thing of others.

DOCTOR (Tb):
Just as a light illumines
Both itself and other things,
Birth produces both itself
As well as other things. [VII.8]

GARFIELD (Tb):
8. Just as a butterlamp Illuminates itself as well as others,
So arising gives rise to itself
And to other arisen things.

GARFIELD-SAMTEN (Tb):
8. Just as a butterlamp Illuminates itself as well as others,
So arising gives rise both to itself
And to other things.

HAGEN (paraphrase):
As a light illuminates itself as well as others, so does arising produce both itself and others.
PINGALA COMMENTARY

7/9 Just as a light brought in to a dark room completely illumines every object, and also illumines itself, so also arising is similar; it can produce other things and it can produce itself.

Reply: Not so, and why?

KALUPAHANA COMMENTARY

Here, a metaphor is utilized to explain the Sautrantika version of the causal theory. The thrust of the argument is that it is not necessary for an event to endure before it can produce some other effect. A lamp or light does not have to remain for a while before it could illuminate itself as well as others. This is the same argument used by the Sautrantikas and other idealistic schools to justify the existence of a cogito discussed above (see also Masaaki Hattori, Dignaga On Perception, Cambridge: Harvard University Press, 1968,). The Sautrantikas feared that any conception of duration or statis (sthiti) will lead to the unacceptable view of substance (svabhava).

GARFIELD COMMENTARY

8. Nāgārjuna now launches a lengthy critique of the example, arguing that the relation between the butterlamp and what it illuminates is not one that supports a notion of an inherently existent basis on which things that are not inherently existent can depend:
Kārikā VII.9

Verse 9 (Nagarjuna asserts) There is no darkness in light or in its abode. What does light illumine when, indeed, it destroys darkness?

INADA (Skt):
Verse 9 (Nagarjuna asserts) There is no darkness in light or in its abode. What does light illumine when, indeed, it destroys darkness?

JONES (Skt):
[Reply:9] There is no darkness in the light or where the light is located. What then does a lamplight illuminate, since illumination is the destroyer of darkness?

KALUPAHANA (Skt):
There exists no darkness either in the light or in whatever place it is situated. What does light illumine? For, illumination is indeed the destruction of darkness.

MCCAGNEY (Skt):
There is no darkness in light or where this [light] is situated. What does a lamp illumine when light indeed destroys darkness?

NISHIJIMA (Skt?):
9. In the existence of light, darkness does not exist really. And so in such a situation, it must be necessary for light to exist there alone. Why does it possible for light to make other things to be seen? Because the brightness is able to destroy darkness actually.

STRENG (Skt):
9. Nāgarjuna answers: There is no darkness in the light and there where the light is placed. What could the light illumine? Indeed illumination is the getting rid of darkness.

BOCKING (Ch):
7v10 In a light there is naturally no darkness And in the place where it abides there is no darkness. 'Destruction of darkness' is what is meant by light. Where there is no darkness there is no light.

BATCHelor (Tb):
Wherever lamplight is present there is no darkness. What does lamplight illuminate? It illuminates by dispelling darkness.

DOCTOR (Tb):
Light itself and the place where it is—Neither of these have any darkness. What does light illuminate? Illumination occurs by dispelling darkness. [VII.9]

GARFIELD (Tb):
9. In the butterlamp and its place, There is no darkness. What then does the butterlamp illuminate? For illumination is the clearing of darkness.

GARFIELD-SAMTEN (Tb):
9. In the butterlamp and its place There is no darkness. What then does the butterlamp illuminate? For illumination is the clearing of darkness.

HAGEN (paraphrase):
There exists no darkness either in the light or in whatever place it is situated. What does light illuminate? For, illumination is indeed the destruction of darkness.

ENGLISH TRANSLATIONS
PINGALA COMMENTARY

7/10 The substance of light is itself without darkness, and places reached by the light are also without darkness. Since light and dark are opposites, light means the destruction of darkness. Where there is no darkness there is no light. How can you say that the lamp illuminates both itself and other things?

Question: The lamp does not have light before it is produced, and it does not have light after it is produced, it is simply that at the moment of production of the light it is able to illumine itself and illumine others.

Reply:

KALUPAHANA COMMENTARY

Nagarjuna’s criticism of the Sautrantika theory begins here. In order to get rid of the metaphysics associated with the Sautranika theory of change and causation, Nagarjuna begins by questioning the meaning of the term “illumination” (prakasa). For him, light (aloka) and darkness (andhakara) are relative ideas. This same idea is expressed by the Buddha at S 2.150, where it is said: “This so-called element of light is known through its dependence upon darkness” (yayam.. abhadhatu ayamdhatu andhakaram paticca pannayati; see also Nagarjuna’s discussion in his Ratnavali [Ratnavali of Nagarjuna, ed. G. Tucci, Journal of the Royal Asiatic Society, London, 1934, 1936, 1.48]). The relationship here is by way of contrast; the absence of one means the presence of the other. Thus, “illumination” is synonymous with the “destruction of darkness” (tamo-vadhah), one is not produced by the other in any substantial way.

GARFIELD COMMENTARY

9. Here Nāgārjuna is emphasizing a disanalogy between the relation between the butterlamp and what it illuminates, and the putative relation between dependent arising and what it depends upon. The opponent who wields the example does so in order to demonstrate a difference in status between dependent arising and the dependently arisen. Dependent arising is meant not to be dependently arisen, despite the fact that all dependently arisen phenomena are. So the appropriate analogy in the case of the lamp would map this difference in status between being dependently arisen and being independent onto the difference between being illuminated and not being illuminated. The problem, though, is that in the example there is nothing that is not illuminated: Everything in the neighborhood of the lamp is illuminated just as is the lamp. It was standard philosophical fare in the Buddhist tradition within which Nāgārjuna was working to see darkness as a positive phenomenon. So to the extent that one adopted a reified ontology, darkness would be reified as easily as light. The attack on the butterlamp analogy can thus effectively exploit the difficulties Nāgārjuna has already developed for theories that require inherently existent things to be related to one another. But it is important to see that even if one is not disposed to reify darkness, and regards it as the mere absence of light, to the extent that one reifies light, Nāgārjuna can argue that one will be compelled to reify darkness as well. For if light exists inherently, then wherever light is not present it is essentially not present. And the essential nonpresence of light is essential darkness.
Verse 10 - How could darkness be destroyed by a presently shining light? For, indeed, the presently shining light has not as yet extended over to darkness.

[10] How is darkness destroyed by the arising light when the arising light does not reach the darkness?

How can darkness be destroyed by the emergent light, when the emergent light, indeed, does not teach darkness?

How is darkness destroyed by the shining of light? Indeed there is no shining when light is reached by darkness.

With what kind of process does it be realized actually? Relying upon brightness, Darkness might be destroyed. Because it is not true that the darkness is always keeping to be produced, Therefore it must be true that the brightness might be able to arrive at every moment.

10. How is darkness destroyed by the light being originated, When the light, being originated, does not come in contact with darkness?

How can darkness be destroyed by the emergent light, when the emergent light, indeed, does not teach darkness?
PINGALA COMMENTARY

7/11 At the instant of its arising the light is said to be half arisen and half not-yet-arisen. If the substance of the light is not yet complete, how can it destroy the darkness? Moreover, the light cannot reach the darkness, just as a man, catching a thief, considers him nullified. If you claim that light, even though it does not reach the darkness nevertheless destroys the darkness, this too is wrong, and why?

KALUPAHANA COMMENTARY

The example of light and darkness used to illustrate the causal relationship between two momentary events is here shown to be inappropriate, as it eventually leads to a rather substantialist notion of light reaching up to darkness in order to destroy it.

GARFIELD COMMENTARY

10. Moreover, argues Nāgārjuna, the example itself does not bear close scrutiny as a case of an entity with some inherent power giving rise to a set of effects that depend upon it. For the task of the butterlamp is the clearing of darkness - or the production of illumination. Now the production of light and the clearing of darkness are, Nāgārjuna claims, equivalent. So, if the butterlamp illuminates objects by its light reaching them, it should clear darkness by means of its light reaching darkness. But that would be for light and darkness to be present in the same place, which is contradictory.
**Kārikā VII.11**

aprāpyaiva pradīpena yadi vā nihatam tamaḥ |
ihasthaḥ sarvalokastham sa tamo nihaniṣyati ||11||

**ENGLISH TRANSLATIONS**

INADA (Skt):
Verse 11 - If darkness is destroyed by light which is not extended, then light, in such a state, will destroy the whole world of darkness.

JONES (Skt):
[11] Indeed, if the darkness is destroyed by the light that has not yet reached it, then the light existing here will destroy all the darkness existing in all the worlds.

KALUPAHANA (Skt):
On the contrary, if darkness is destroyed by light without reaching it, then that [light] remaining here will destroy the darkness present in all the worlds.

MCCAGNEY (Skt):
But if darkness is overwhelmed by the light without having reached it then in that case, it will destroy the darkness abiding in all the world. ‘

NISHIJIMA (Skt?):
11. The facts, which are not realized, have come from brightness, At that time, the destroyer is also darkness again. And so the object, which is always destroyed, is just darkness itself. Therefore darkness will be always the cause of going down.

STRENG (Skt):
11. But then, if darkness is destroyed by a light having no contact with darkness, A light placed here will destroy the darkness of the entire world.

BOCKING (Ch):
7v12 If a light, before it reached darkness, Could nevertheless destroy the darkness, A light in here Would destroy all darkness.

BATCHELOR (Tb):
If darkness is dispelled even though it does not encounter lamplight, this [lamplight] dwelling here would eliminate the darkness that dwells in all the worlds.

DOCTOR (Tb):
If light were to dispel darkness,
Even without encountering it,
Then the one right here would dispel
All the darkness in the world, [VII.11]

GARFIELD (Tb):
11. If the illumination of darkness occurs
Without the butterlamp reaching darkness, All of the darkness in the world Should be illuminated.

GARFIELD-SAMTEN (Tb):
11. If, without making contact, The butterlamp clears darkness, All of the darkness remaining in the world Should be cleared by that which is placed here.

HAGEN (paraphrase):
On the contrary, if darkness is destroyed by light without reaching it, then that [light] remaining here will destroy the darkness present in all the worlds.
PINGALA COMMENTARY

7/12 If a light had the power to destroy darkness without reaching it, then a lamp lit here would be able to destroy darkness everywhere, because the two would have no contact. Moreover, a light should not (be said to) illumine itself and illumine others, and why?

KALUPAHANA COMMENTARY

The contrary of the substantialist view referred to at VII. 10 is here shown to lead to further confusion. If light can destroy darkness without reaching it, the implication would be that any spark of light anywhere can destroy the darkness present in the entire universe.

GARFIELD COMMENTARY

11. If it is not necessary, on the other hand, for the light of the butterlamp to reach darkness in order to dispel it, since there is a lot of darkness in the world not reached by any single butterlamp, that butterlamp should be capable of dispelling all of that darkness.
Kārikā VII.12

pradīpaḥ svaparātmānau samprakāśayate yadi |
| tamo ’pi svaparātmānau chādayisatyat asaṃśayam ||12||

| mun pa’aṅ raṅ daṅ gźan gyi dṅos | | sgrib par ’gyur bar the tshom med |

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 12 - If light illumines both itself and other entities, then undoubtedly, darkness will also darken itself and other entities as well.

JONES (Skt):
[12] If a lit lamp illuminates itself and other things, then surely darkness too covers itself and other things.

KALUPAHANA (Skt):
If light were to illuminate both itself and others, then certainly darkness too will conceal itself and others.

MCCAGNEY (Skt):
If light is illuminated by itself or by another [source], then darkness will undoubtedly conceal itself as well as others.

NISHIJIMA (Skt?):
12. Brightness is oneness between something subjective and something objective. , Therefore it might be some kind of manifestation at the time. Darkness is also oneness between something subjective and something objective. Therefore darkness also covers the facts, which are not clear.

STRENG (Skt):
12. If the light illuminated both itself and that which is other than itself, Then, without a doubt, darkness will cover both itself and that which is other than itself.

BOCKING (Ch):
7v13 If a light’ could illumine itself And could illumine other things Darkness, too could darken itself And also darken other things.

BATCHELOR (Tb):
If lamplight illuminated itself and the thing of others, darkness too would without doubt obscure itself and the thing of others.

DOCTOR (Tb):
If light could illumine Both itself and other things, Darkness would undoubtedly conceal Both itself and other things as well. [VII.12]

GARFIELD (Tb):
12. If, when it is illuminated, The butterlamp illuminates itself and others, Darkness should, without a doubt, Conceal itself and others.

GARFIELD-SAMTEN (Tb):
12. If the butterlamp Illuminates itself and others, Darkness should, without a doubt, Conceal itself and others.

HAGEN (paraphrase):
If light were to illuminate both itself and others, then certainly darkness too will conceal itself and others.
PINGALA COMMENTARY

7/13 If light, being the opposite of darkness, can illumine itself and also illumine other things, then darkness, being the opposite of light, should also darken itself and other things. If darkness, being the opposite of light cannot darken both itself and other things, then light, being the opposite of darkness, should likewise be unable to illumine itself and other things. Therefore light is no illustration. Because we have not yet exhaustively refuted the causes and conditions of 'arising', we must now further expound them.

KALUPAHANA COMMENTARY

Taking the argument of the substantialist at VII.8 that light illuminates itself as well as others, Nagarjuna is here showing that the same could be said of darkness too, which would invalidate the meaningfulness of the very example used by the substantialist.

GARFIELD COMMENTARY

12. Finally, Nāgārjuna argues, if we are seriously to maintain that the butterlamp illuminates itself and others through a luminous essence, then since the essence of darkness is to conceal things, and things with such essences affect themselves and others, we should expect darkness to be self-concealing. But then we would not see darkness.

The point of all of this is not that we can’t see lamps when they are lit or that we can when they aren’t. Rather it is that the mechanism by which we see what we see when a lamp is lit is the same whether we are seeing the lamp or other things. To put it in contemporary terms, photons reach our eyes from the lamp or from its flame in the same way they do from the other physical objects in the neighborhood. And just as the visibility of the things in the neighborhood is dependent on a host of conditions, so is the visibility of the lamp. So we do not have even an analogy to a case where the status of dependent arising would be distinct from that of the dependently arisen.
Kārikā VII.13

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 13 - How could an origination which has not arisen give rise to its own self? Again, if that which has arisen gives rise to itself, how could there be a rise again?

JONES (Skt):
[13] How could an arising that is not yet arisen give rise to itself. And if what is already arisen produces the arising, then, since it is already arisen, what is going to be produced again in what is already produced?

KALUPAHANA (Skt):
How can this non-arisen arising produce itself? If it is the arisen that produces, then being born, what is it that is produced again?

MCCAGNEY (Skt):
How would this arising, which has not arisen, give rise to itself? Besides, if it is the arisen that is given rise to, again, the arisen is given rise to by what?

NISHIJIMA (Skt?):
13. What has never been produced, but what has appeared, is this World, Therefore how is it possible for any subjective personality to be born? And so appearance might be born as birth, Therefore how is it possible for birth to be born again actually?

STRENG (Skt):
13. If it has not yet originated, how does origination produce itself? And if it has already originated, when it is being produced, what is produced after that which is already produced?

BOCKING (Ch):
7v14 When arising has not yet arisen
How can it produce itself?
If, already arisen, it produces itself, Being already arisen, why would it need to arise?

BATCHelor (Tb):
How can unborn birth give birth to itself? If the born gives birth, when it has been born, what would be born?

DOCTOR (Tb):
When it has not arisen itself,
How could arising produce its own nature?
If it does so having already arisen, Having arisen, what is it that is produced? [VII.13]

GARFIELD (Tb):
13. How could this arising, being nonarisen, Give rise to itself? And if it is arisen from another, Having arisen, what is the need for another arising?

GARFIELD-SAMTEN (Tb):
13. How could this arising, being non-arisen, Give rise to itself? And if it is arisen from something arisen, Having arisen, what is there to arise?

HAGEN (paraphrase):
How can this non-arisen arising produce itself? If it is the arisen that produces, then being born, what is it that is produced again?
PINGALA COMMENTARY

7/14 On an occasion when arising produces itself, either it will arise when it has already arisen, or it will arise when it has not yet arisen. If it arises without being arisen then it is not a dharma, and if it is not a dharma, how can it produce itself? If you say that it arises when already arisen, then it may be considered as already complete, and there is no need for any further arising, just as something that has already been made should not be made again. So, whether already arisen or not yet arisen, neither of these two arises, and consequently there is no arising. You earlier said that arising was like a lamp in that it could both produce itself and produce others. This is not correct, and the same goes for abiding and ceasing. Again:

KALUPAHANA COMMENTARY

The principle adopted at I.6 in criticizing the identity and non-identity theories of causation is here applied to reject the notion of a self-creating arising. The metaphysical assumptions associated with the Sautrantika theory of momentary arising is laid bare by an examination of the so-called "deep structures." i. (non-arisen) arising produces itself ii. (arisen) arising produces itself The first alternative is impossible. The second is meaningless

GARFIELD COMMENTARY

13. Here Nāgārjuna is bringing us back to the original argument and reminding us of the reificationist’s uncomfortable choice between a vicious regress and a begged question. If every arisen thing depends on an ontologically prior arising, we have an infinite regress. For each arising will require such a foundation. But if we cut off the regress by presupposing at some level a nonarisen dependent arising, we have to ask why that level is exempt from the need for explanation. Nāgārjuna now announces the conclusion he will defend in the next section of the chapter:
Kārikā VII.14

notpadyamānaṃ notpannaṃ nānutpannaṃ kathaṃ cana | 
upṭadyate tad ākhyātaṃ galyamānagatagataḥ ||14||

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 14 - In no way is it possible that origination rises from presently arising, that which has arisen, or that which has not arisen. This (line of argument) has already been discussed with respect to gatyamana, gata, and agata. - Note: Reference is here made to Chapter II on Gatagata pariksha.

JONES (Skt):
[14] Neither what is currently arising, nor the arisen, nor what is non-arisen arise in any way at all. Thus, they are explained by the analysis in Chapter 2 of the moving, the moved, and the unmoved.

KALUPAHANA (Skt):
Neither the present arising, nor the arisen, nor the non-arisen, is being arisen in any way. This has already been explained by means of [the concepts of] present moving, the moved and the not yet moved.

MCCAGNEY (Skt):
How do neither the nonarising, the nonarisen, or the arisen [not unarisen] arise? They are known in the [same] way as going, gone, and not gone.

NISHIJIMA (Skt?):
14. This world is not the world, which has been produced, or the world, which hasn't be accomplished yet. How is it possible for the world not to be the world, which hasn't been born at all? Even though a concrete thing, which has been born, without having any name yet, They can be called with the name of “is going”, “have gone”, or “not have gone.”

STRENG (Skt):
14. In no way does anything originate by what is being originated (ii), by what is already originated (iii), or by what is not yet originated (i)—Just as it has been said in the analysis of "presently going to (ii)," "that which is already gone to (i)" and "that which is not yet gone to (iii)."

BOCKING (Ch):
7v15 Arising is not produced after it has arisen. For is it produced before it has arisen. Nor is it produced at the same time as it arises. This has already been dealt with in (the chapter or) ‘going and coming’.

BATCHelor (Tb):
The born and the unborn, the being born do not in any way give birth. That has been explained by the gone, not gone and going.

DOCTOR (Tb):
The arisen, unarisen, and arising Are not produced in any way. Thus was explained before By what was, will be, and is being traversed. [VII.14]

GARFIELD (Tb):
14. The arisen, the nonarisen, and that which is arising Do not arise in any way at all. Thus they should be understood Just like the gone, the not-gone, and the going.

GARFIELD-SAMTEN (Tb):
14. The arisen, the non-arisen, and that which is in the process of arising Do not arise in any way at all. Thus they are explained Through the gone, the not-gone, and the going.

HAGEN (paraphrase):
Neither the present arising, nor the arisen, nor the non-arisen, is being arisen in any way. This has already been explained by means of [the concepts of] present moving, the moved and the not yet moved.
7/15 'Arising' means that by a combination of causes there is arising. In something already produced there is no activity, and hence no arising, and in something not yet produced there is no activity and hence no arising. In the instant of arising there is also none. You cannot have an instant of arising separated from a dharma of 'arising', and you cannot have a dharma of arising separate from the instant of arising. How can there be arising in the moment of arising? This point has already been dealt with in (the chapter on) going and coming.

(10a25) A dharma which has already arisen cannot arise. Why is this? For something already arisen to arise again and continue thus repeatedly would be endless, like something already made being made again. Moreover if, after having arisen, it were again to arise, by what dharma of arising would it arise? Its mark of arising would not yet have arisen, yet you say that it arises after already having arisen. This contradicts your own statement, and why? Although the mark of arising has not yet arisen you say there is arising. If you say that there is arising even though something has not yet arisen, the dharma can either be already arisen, and yet still arise, or it can be not-yet arisen, and yet still arise. You earlier said that it arose after having already arisen, but this is not settled.

Again, just as something already burnt cannot-burn again, and something already gone cannot go again, for the same reasons as apply in these cases, something already arisen cannot arise again.

(10b4) A dharma not yet arisen does not arise either, and why? If a dharma has not yet arisen, it cannot combine with its productive causes, and if it does not combine with its productive causes, then there is no arising of the dharmas. If dharmas arose without having combined with their productive causes, then there would be action without dharmas of action, going without dharmas of going, passion without dharmas of passion, anger without dharmas of anger and delusion without dharmas of delusion, and such being the case all dharmas in the world would be negated. Therefore, a not-yet-arisen dharma does not arise.

(10b9) Moreover, if a dharma not yet arisen could arise, all dharmas in the world not yet arisen should arise. All the ordinary people in whom enlightenment has not yet arisen could now produce the dharma of imperishable bodhi

(10b18) Answer. If a dharma is produced by the combination of conditions such as time, space, etc., then it is not a preexistent thing that arises, nor a non-pre-existent thing that arises, nor a both pre-existent and non-pre-existent thing that arises, for these three (possibilities) have already been refuted. Consequently something already arisen does not arise, and something not yet arisen does not arise.

(10b20) In the moment of arising there is no arising either, and why? (Because) the already-risen part does not arise, and the not-yet-arisen part does not arise, as has already been shown. Furthermore, if there were a moment of arising separate from arising, this moment of arising would itself have to arise, but there is no moment of arising separate from arising, and therefore in the moment of arising there is no arising either.

(10b24) Moreover, if you say that the moment of arising itself arises, there would be the fallacy of two arisings; the first known as the moment of arising and the second being the arising within the moment of arising, and to have these two is incorrect. There are not two. dharmas involved, for how can there be two arisings? Therefore, 'in the moment of arising too, there is no arising'.

(10b27) Moreover, before the dharma of arising is manifested, there is no moment of arising, and since there is no moment of arising, what could arising depend on? Therefore you cannot say that the moment of arising arises. According to our investigation then, there is no arising, in what has already arisen, there is no arising in what has not yet arisen, and there is no arising in the moment of arising. Because there is no arising, arising is not established, and arising not being established, abiding and ceasing also cannot be established. Since arising, abiding and ceasing cannot be established, active dharmas cannot be established. This is why it says in the verse that this has already been dealt with in relation to the gone, the not-yet-gone and the moment of going. Question:

(10c3) We do not exactly say that there is arising in the already arisen, arising in the not-yet-arisen and arising in the moment of arising, but merely that through the combination of causal conditions there is arising.

Reply. Even though you state it like this, it is still incorrect, and why?
KALUPAHANA COMMENTARY

The analysis of present arising (utpadyamana), the arisen (utpanna), and the non-arisen (anutpanna) conceived of in metaphysical terms compares well with the analysis of motion in Chapter II.

GARFIELD COMMENTARY

14. Recall the analysis of motion: Nāgārjuna argued that no entity answering to “motion” could be found in an entity that was in motion in the past, nor in an entity yet to move, nor in a currently moving entity. Motion had to be understood relationally and not as an entity. Using similar reasoning, Nāgārjuna will now argue that arising cannot be found as an entity in something not yet arisen, nor in something that has already arisen, ‘nor in something yet to arise. Arising will also fail to be an entity and will have to be understood relationally. This will provide the key both to the refutation of the position that underlies both extreme positions - that for arising to exist, it must exist inherently - and to the construction of a coherent positive account of dependent arising. The next three verses begin a sketch of dependent arising as empty, connecting this fact with the emptiness of dependently arisen phenomena:
Kārikā VII.15

उत्पद्यमानमृत्तलाविदं न क्रमते यदा।
कथा उत्पद्यमानं तु प्रतीत्योपत्तिमुच्यते॥१५॥

若謂生時生  是事已不成
云何眾緣合 爾時而得生

| ji ltar skye la brten nas ni | | (5)skye bzin žes ni brjod par bya |

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 15 - When tills presently arising does not proceed from the origination, how can it be said that the former depends on the latter?

JONES (Skt):
[15] The present arising does not take place within something arising. So how can we say that what is currently arising is dependent upon that something?

KALUPAHANA (Skt):
When this present arising does not proceed from within arising, indeed how can the present arising be spoken of as dependent arising?

MCCAGNEY (Skt):
If this present arising is not preceded by arising, how is present arising called dependent arising?

NISHIJIMA (Skt?):
15. A fact that something is going on,
Suggests that anything hasn’t been accomplished yet.
In that situation what has been going on?
Then it might be a very clear enjoyment of productivity.

STRENG (Skt):
15. When in that-which-is-originated (iii), there is nothing which activates that which is being originated (ii), How can one say: That which is being originated (ii) exists presupposing that which is produced?

BOCKING (Ch):
7v16 If you say that there is arising in the moment of arising
This fact has not been established.
In the moment when conditions are combining.
How can there be arising?

BATCHELOOR (Tb):
When being born does not arise in what is born, then how can one say “[it is] being born in dependence on the born”?

DOCTOR (Tb):
When there is arising,
Current arising occurs,
Yet, when there is none, how can you claim That this current arising is based on arising? [VII.15]

GARFIELD (Tb):
15. When there is arising but not yet
That which is arising,
How can we say that that which is arising Depends on this arising?

GARFIELD-SAMTEN (Tb):
15. When there is arising,
That which is in the process of arising comes into existence.
But when there is not, How can you say that that which is in the process of arising Depends on this arising?

HAGEN (paraphrase):
When this present arising does not proceed from within arising, indeed how can the present arising be spoken of as dependent arising?
PINGALA COMMENTARY

7/16 Arising in the moment of arising has been refuted already—for various reasons. How can you again say that there is arising, as a result of the combination of causal conditions? Whether causal conditions are complete or incomplete, they are refuted together with arising. Again:

KALUPAHANA COMMENTARY

The first line utilizes the conceptual apparatus of the substantialists in speaking of the effect (i.e., the present arising, utpadyamana) as issuing out of the cause (i.e., the arising, utpatti). This is a theory of self-production. As indicated in I.7, Nagarjuna rejects this causal explanation as meaningless, for there is actually no production of anything new in such a context. It is mere self-re-production. If the substantialist were to adopt the terminology of the Buddha (utilized so often by Nagarjuna), then he could say that the “present arising is dependent (pratitya) upon arising.” Even though this sounds like the Buddha’s (and, therefore, Nagarjuna’s) formulation of the causal principle, yet Nagarjuna is not willing to recognize it. This is because dependent arising does not simply mean the reproduction of the same thing. In the present case, it is an explanation of the present arising (utpadyamana) on the basis of arising (utpatti), which is simply tautological with no new information provided. “Dependent arising” accounts for the arising of something new or different, even though such newness or difference is not emphasized to the complete neglect of the relationship of dependence.

The present verse is indicative of the manner in which the Sautrantikas, while trying to explain causation in terms of “association” of discrete momentary entities, were eventually led to a substantialist conception causation. Either they had to accept self-causation or remain satisfied with mere self-re-production, the latter providing no explanation of creativity at all. “Dependent arising,” on the contrary, accounts for creativity without falling into the substantialist trap.

GARFIELD COMMENTARY

15. Nāgārjuna here suggests that the way the reificationist has gone about posing the philosophical problem about the status of dependent arising itself is all wrong. The initial presumption at the basis of this debate is that arisen entities arise from an independently existing process of dependent arising. But this is wrongheaded in at least two ways: First, phenomena arise from other phenomena, not from arising. So, for instance, if I strike a match, the fire emerges from the friction, the sulphur, the oxygen, my desire for light, and so forth, but not from dependent arising itself. That is a fact at a different level of analysis, which itself comprises the network of relationships just indicated. Second, if the existence of the process of arising antedates the existence of the arisen, it cannot be a sufficient condition or a complete explanation of the arisen. For if it were, the arisen would then exist. That being so, Nāgārjuna asks, “Why posit dependent arising itself as a phenomenon within the framework of dependent arising?”
Kārikā VII.16

pratītya yad yad bhavati tat tac chāntam svabhāvataḥ |
tasmād upadhyamāṇaṃ ca śāntam utpattir eva ca ||16||

ruò fā zhòng yuán shēng ji ji miè xìng

| de phyir skye bźin ŋid daṅ ni || skye ba yaṅ ni ŋi ba ŋid |

INADA (Skt):
Verse 16 - Any entity which exists by virtue of relational origination is quiescence in itself. Therefore, presently arising and origination per se are likewise in the nature of quiescence.

JONES (Skt):
[16] Whatever arises dependently is inherently pacified. Therefore, what is currently arising and the arising itself are pacified.

KALUPAHANA (Skt):
Whatever that comes to be dependently, that is inherently peaceful. Therefore, that which is presently arising as well as arising itself are peaceful.

MCCAGNEY (Skt):
That which comes into being dependently, that is inherently peaceful. Therefore arising and presently arising are peaceful.

NISHIJIMA (Skt?):
16. Miscellaneous things and phenomena can exist as they are, And those things and phenomena manifest the serene situations as they are. Therefore what they are manifesting themselves really, Are the balanced and serene situations as they are just in front of us.

STRENG (Skt):
16. Whatever comes into existence presupposing something else is without self-existence (stabhava). As there is an allayment of "being originated," so also of that which is originated (iii).

ROBINSON (Skt):
Whatever comes into being in dependence is quiescent by its own-being; therefore the now-arising is quiescent, and so is production.

ENGLISH TRANSLATIONS

BOCKING (Ch):
7v17 If a dharma arises from conditions Its nature will be calm extinction. Therefore arising and the moment of arising Would both be nirvanic.

BATCHelor (Tb):
Whatever is dependently arising, that is by nature pacified. Therefore, being born and what is born too are pacified.

DOCTOR (Tb):
That which originates dependently Is peace by its very essence. Arising and the currently arising as well Are, therefore, peace itself. [VII.16]

GARFIELD (Tb):
16. Whatever is dependently arisen, Such a thing is essentially peaceful. Therefore that which is arising and arising itself Are themselves peaceful.

GARFIELD-SAMTEN (Tb):
16. Whatever is dependently arisen, That thing is essentially peaceful. Therefore that which is in the process of arising and arising itself Are themselves peaceful.

HAGEN (paraphrase):
Whatever that comes to be dependently, that is inherently peaceful. Therefore, that which is presently arising as well as arising itself are peaceful.
7/17 Dharmas produced by conditions have no self-nature and are consequently nirvanic. Nirvana is considered to be nonexistent, but this non-existence and the marks of this nonexistence cut off the flow of words and put an end to all sophistries. The meaning of 'conditions' may be likened to cloth which exists because of its threads, or a rush mat which exists because of the rushes. If the threads themselves had fixed characteristics, they would not come from hemp. If the cloth itself had fixed characteristics, it would not come from the threads, but in fact we do get cloth from threads, and threads from hemp, so threads have no fixed nature, and cloth has no fixed nature. It is like fire and fuel, which are established by the combination of causal conditions and have no self-nature. Without fuel there is no fire, and without fire there is no fuel.

(10c20) All dharmas are like this; therefore dharmas arising from causal conditions have no self-nature, and having no self-nature are empty and unreal like a mirage. This is why the verse says that arising and the moment of arising are both nirvanic. We should not say that there is arising of the moment of arising. Although you wish to establish by various reasonings a characteristic of 'arising', these are all sophistries and do not have the characteristic of nirvana.

Question. There is definitely a differentiation between the three periods of time. A dharma which belongs to the future may arise. If there are causes and conditions it will arise. How can you say that it will not arise?

Reply:

KALUPAHANA COMMENTARY

This singularly important statement in the present chapter comes after VII. 15 where Nagarjuna refused to recognize a form of "dependent arising" that also carries the implication of self-causation (svata-utpati). The notion of dependent arising (pratitya bhavati = pratityasamutpada) is simply free from any idea of self-causation involving substance or self nature (svabhavatah satam) and, in that sense, is "inherently peaceful." It does not contribute to the notion of "self" (atman, svabhava) or "other" (para) and, as a result, does not generate lust (raga) or hatred (dvesa), attachment or aversion. It is the more appropriate view regarding the present arising (utpadyamna) as well as arising (utpatti) and constitutes an understanding (jnana) or wisdom (prajna) that brings about freedom (vimukti, nirvana). It is indeed not a negation of arising (utpada, utpatti), but simply a non-substantialist way of perceiving such phenomena.

GARFIELD COMMENTARY

16. The sense of "peaceful" (zhi-ba) here is important. Nāgārjuna is asserting that things are not, from the ultimate point of view, in the constant flux of arising, remaining, and decaying that characterizes them from the conventional point of view. This will be the conclusion of the extended argument that follows and is here merely announced in advance. But it is important at this stage to be clear about just what Nāgārjuna is asserting for it is indeed a delicate point: It is true that ordinarily and prereflectively, and sometimes as the result of bad philosophy, we tend to think of things as permanent and as having fixed essential natures. But a careful reflection on the nature of conventional phenomena shows them on analysis to be impermanent and, hence, to be characterized by the three properties of arising, stasis, and cessation. (fn 54. Such remarks also make it hard to sustain the nihilistic reading of the text Wood (1994) offers. For here Nāgārjuna is clearly committed to the claim that there are dependently arisen phenomena.)

But while this takes us to a deeper understanding of the nature of phenomena, it does not take us all the way. For phenomena, having no essence, cannot have even these properties essentially. One way of seeing that is this: If we take the import of the threefold nature of phenomena seriously, we see that the phenomena are themselves literally momentary. And if they are momentary, then there is literally no time for them to arise, to endure, or to decay. So from an ultimate point of view, the point of view from which they have no existence as extended phenomena at all, they do not possess these three properties. Hence no single real entity is in flux. In this sense they are peaceful. Nāgārjuna points out the other way of seeing phenomena in the next verse: It does not follow from the fact that there are no inherently existent arisen entities that there are non-arisen ones. All phenomena are arisen, but they arise as empty, and as dependent. Coming to be just is arising, and all arising is dependent arising.

Nāgārjuna now turns his attention to an analysis of the three characteristics of arising, stasis, and cessation, showing of each in turn that it cannot be understood as ontologically independent. He begins with arising:
Kārikā VII.17

INADA (Skt):
Verse 17 - If an entity which has not arisen is granted to exist somewhere, then it would originate. But how could this entity, when it actually does not exist, originate?

JONES (Skt):
[17] If any non-arisen entity is found anywhere, then it would arise. But how does it arise when it does not exist?

KALUPAHANA (Skt):
If a certain non-arisen existent is evident somewhere, then that would arise. When such a thing does not exist, how can an existent arise?

MCCAGNEY (Skt):
If there is any nonarisen being, it would be arisen by being found anywhere. Where the being does not exist, it is arisen by what?

NISHIJIMA (Skt?):
17. When even a little bit of thing hasn't been seen, What is called “existence” might be recognized as if it were actually exist. It might be possible for something to appear from something concrete, But it might be perfectly impossible for "existence" really to exist at all.

STRENG (Skt):
17. If some particular thing which is not yet originated (i) is indeed known to exist, That thing will be originated. What originates if it does not exist?

BOCKING (Ch):
7v18 If there is a dharma which has not yet arisen, And you say that it will arise, If this dharma already exists What need will it have for any further arising?

BATCHELOR (Tb):
If any unborn thing existed anywhere, on being born that [unborn] thing would not exist. If so, what would be born?

DOCTOR (Tb):
If an unarisen entity were to exist somewhere, Then that could arise. But, when it does not exist, What sort of thing could then arise? [VII.17]

GARFIELD (Tb):
17. If a nonarisen entity Anywhere exists, That entity would have to arise. But if it were nonexistent, what could arise?

GARFIELD-SAMTEN (Tb):
17. If a non-arisen entity Exists anywhere, That entity would have to arise. But if it were nonexistent, what could arise?

HAGEN (paraphrase):
If a certain non-arisen existent is evident somewhere, then that would arise. When such a thing does not exist, how can an existent arise?
PINGALA COMMENTARY

7/18 If, in the future period of time, there is a not-yet-arisen dharma which arises, since this dharma will already have arisen, why will it need to arise again? An existent dharma should not have to arise again.

Question. Although it will exist in the future, this is not like the characteristic of (being in) the present. We call it arisen when it takes on the characteristic of being in the present.

Answer. The characteristic of present existence is not in the future. Since it is not in the future, how can you say that a future dharma arises?

(11a3) If something exists it is not regarded as future, but as present. What is present has no need to arise again, and since neither of these arise, there is no arising. Furthermore; you say that arising at the moment–of arising can also give rise to something else. We must now give a further explanation.

KALUPAHANA COMMENTARY

Here Nagarjuna seems to be setting up the Sarvastivada theory of identity against the Sautrantika view of non-identity. The identity theory of causation recognizes an entity (bhava), permanent and eternal, lying concealed somewhere (kvacit), and therefore not yet arisen (anutpanna). If such a thing were to exist, then it could be said to arise. However, if such a thing were to be non-existent (tasmin asati), how can one say that a thing or entity arises? This is, once again, a criticism of the Sautrantika theory of the arising of a non-existing entity (abhiṣṭva bhava utpada, Akb; see also Kalupahana, Causality,). Here, Nagarjuna is maintaining that the Sarvastivada theory of causation, though excessively metaphysical, may be intelligible in some way, but that the Sautrantika theory of the arising of a non-existent entity makes no sense at all.

GARFIELD COMMENTARY

17. We can exclude nonarisen entities from the analysis since the only sense that we can make of the existence of any phenomenon is in terms of its having arisen. Arising is hence a ubiquitous characteristic of phenomena. This, of course, is part of what motivates treating it, as well as stasis and cessation, as inherently existent.
Kārikā VII.18

उत्पदयामानमुत्पादो यदि चोत्पादयत्तयमात्र।
उत्पदयेत्तमुत्पादमुत्पाद: कतमः पुनः ||१८||

若言生時生 是能有所生 何得更有生 而能生是生

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 18 - If origination gives rise to the presently arising, then again, what kind of origination will now give rise to the (first type of) origination?

JONES (Skt):
[18] And if an arising were to give rise to the current arising, what arising would give rise to that arising?

KALUPAHANA (Skt):
If arising were to produce this present arising, which arising would again produce that arising of that arising?

MCCAGNEY (Skt):
If the arising of the presently arising is caused by having arisen, again, which arising would give rise to that arising?

NISHIJIMA (Skt?):
18. To be continuing appearance is appearance, And so we can say that this world is always being produced incessantly.
To expect such a world is appearance, And so how is it possible for us to expect the appearance once more?

STRENG (Skt):
18. And if the origination originates that which is being originated (ii), What origination, in turn, would originate that origination? (i.e. infinite regress)

BOCKING (Ch):
7v19 You say that there is an arising at the moment of arising
Then there must be something which is produced;
How can there be any further arising -
Which can produce this arising?

BATCHELOR (Tb):
If that which has been born gives birth to what is being born, what [other thing] that has been born would be giving birth to that which has been born?

DOCTOR (Tb):
If arising gives rise To the currently arising, Then what, in turn, Gives rise to arising? [VII.18]

GARFIELD (Tb):
18. If this arising Gave rise to that which is arising, By means of what arising Does that arising arise?

GARFIELD-SAMTEN (Tb):
18. If this arising Gives rise to that which is in the process of arising, What arising gives rise to That arising?

HAGEN (paraphrase):
If arising were to produce this present arising, which arising would again produce that arising of that arising?
PINGALA COMMENTARY

7/19 If an arising in the moment of arising can produce something else, what is it that this arising in turn produces?

KALUPAHANA COMMENTARY

Infinite regress becomes a necessary corollary of the Sautrantika theory of momentary events. As mentioned earlier, the Sautrantikas were compelled to assume the notion of potentiality (sakti, bija) in order to avoid such infinite regress. Nagarjuna was not ready to accept that solution.

GARFIELD COMMENTARY

18. If we take arisen things to require ontological grounds, then ground them not in other arisen things (since that would generate an obvious regress within the phenomenal world), but in dependent arising itself, there remains the infinite regress to which Nāgārjuna alluded earlier. Assuming dependent arising is to be the ground, then if grounds are needed, it too needs a ground. Nāgārjuna makes this explicit in the following verse: ,
any utpādayaty enaṃ yady utpādo 'navasthiṭhīḥ |
thānūtpāda utpannaḥ sarvam utpadyatām tathā ||19||

ruò wèi gèng; gèng yǒu shēng shēng shēng zé wú qiōng
lí shēng shēng yǒu shēng fǎ jì néng zì shēng

| gal te skye ba gzdan zig gi | | de skyed thug pa med par 'gyur |
| ci ste skye ba med skye na | | thams cad de bzin skye bar 'gyur |

**Kārikā VII.19**

**ENGLISH TRANSLATIONS**

INADA (Skt):
Verse 19 - If another (origination) gives rise to this (first) origination, then origination will go on ad infinitum. But if that which has arisen arises from non-origination, then everything will arise in such a way.

JONES (Skt):
[19] If another arising gives rise to this arising, arising is an infinite series. But if what is arisen is without arising, then everything arises in this manner.

KALUPAHANA (Skt):
If this arising were to produce another, arising would turn out to be infinite regression. If the non-arising is arisen, then it will produce everything in this manner.

MCCAGNEY (Skt):
If another causes this arising, then arising is an infinite regress.
In that way, then, all nonarising is arisen by the arisen.

NISHIJIMA (Skt?):
19. If a little different appearance might be the fact,
Then the appearance might be a little unstable.
In such a situation, nothing has become appeared, is the appearance,
And in that case everything has become accomplished in such situations.

STRENG (Skt):
19. If another origination originates that origination, there will be an infinite regress of originations. But if non-origination is that which is origination, then everything without qualification would originate.

BOCKING (Ch):
7v20 If you say that there are repeated arisings, Then the arising of arising will continue endlessly.
If there is arising apart from the arising of arising, Then dharmas can produce themselves.

BATCHelor (Tb):
If another [thing] that has been born gives birth [to it], this would be endless. If it is born without [another] which has been born [OR if it is born without being born], everything would be born like that [i.e. causelessly].

DOCTOR (Tb):
If arising is due to a separate arising
There will be an infinite regress.
If it arises without arising,
Then so does everything else. [VII.19]

GARFIELD (Tb):
19. If another arising gives rise to this one, There would be an infinite regress.
If something nonarisen is arisen, Then all things could arise in this way.

GARFIELD-SAMTEN (Tb):
19. If another arising gave rise to this one There would be an infinite regress.
If anything arose without arising, Then everything could arise in this way.

HAGEN (paraphrase):
If this arising were to produce another, arising would turn out to be infinite regression. If the non-arising is arisen, then it will produce everything in this manner.
PINGALA COMMENTARY

7/20 If there is repeated arising within arising, then arising will be endless. If there were no such repeated arising and yet there were arising, then all dharmas could produce themselves, but in fact this is not the case. Further,

KALUPAHANA COMMENTARY

Not only does the Sautrantika theory lead to infinite regress (anavastha), it also contributes to the chaotic view that anything can come out of anything, which is the opposite of the Sarvastivada view that nothing comes out of nothing. Causal uniformity has no place whatsoever in the Sautranika scheme of things. This is another point of comparison between the Sautrantika and Humean views of causation.

GARFIELD COMMENTARY

19. The last two lines of this verse emphasize that the regress cannot ever be cut off by positing some nonarisen arising. That would, as Nāgārjuna argued above, patently beg the question.
Kārikā VII.20

satasa ca tāvad utpattir asataś ca na yujyate
na satasa cāsataś ceti pūrvam evopapāditam ||20||
you fà bù yìng shēng wú yì bù yìng shēng
yòu wú yì bù shēng cì yì xiān yì shuí
| re śìg yod dān med pa yān | | skye (7)bar rigs pa ma yin žiān |
| yod med ŋid kyaṅ ma yin žes | | goṅ du bstan pa ŋid yin no |

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 20 - Indeed, an origination relative to either being or non-being cannot by justified. Nor is it possible with being and non-being (at the same time). This has been demonstrated before. - Note: Reference is to Chapter I, Verses 6 & 7.

JONES (Skt):
[20] Thus, the arising of something existent or nonexistent is not admissible. This was demonstrated previously in Chapter 1, verse 6.

KALUPAHANA (Skt):
As such, neither the arising of an existent nor the arising of a non-existent is proper. Even so is the arising of that which is both existent and non-existent, and this has been previously explained.

MCCAGNEY (Skt):
Therefore the arising of what exists and the arising of what does not exist do not occur.
“Existence and nonexistence” have been discussed previously [I, 6-7].

NISHIJIMA (Skt?):
20. Relying upon what really exist, accidence can be recognized, And what do not exist really, can never be regulated by the real existence at all.
No existence and not to exist are the same meaning, And before the time, what has been manifested itself, has been shown in front of us already.

STRENG (Skt):
20. It is not possible that what has originated either exists or does not exist. Nor that what has not originated either exists or does not exist; this has been demonstrated earlier.

ROBINSON (Skt):
It has already been demonstrated that neither of the real nor of the unreal nor of both-real-and-unreal is arising possible.
PINGALA COMMENTARY

7/21 Ordinarily, whatever has arisen is regarded either as an existent dharma which has been produced, or as an inexistent dharma which has been produced, or as a both existent-and inexistent dharma which has been produced. None of these is correct, and this has already been explained. Beyond these three possibilities there is no other (form of) arising, and consequently there is no arising.

Further:

KALUPAHANA COMMENTARY

Neither the identity theory of causation nor the non-identity theory nor even a combination of these two will appropriately account for all the issues relating to causation. This idea continues to be emphasized by Nagarjuna.

GARFIELD COMMENTARY

20. The reference of the last line is to I: 6: “For neither an existent nor a nonexistent thing Is a condition appropriate. If a thing is nonexistent, how could it have a condition? If a thing is already existent, what would a condition do?” The implicit argument is, then, that inherently existent phenomena cannot be said to arise since they would exist eternally and independently; nonexistent phenomena cannot be said to arise since if they did, they would exist. Arising can hence only be a property of, noninherently, but conventionally, existent phenomena. But it then follows that arising as a property can only be a noninherently existent, conventional property.

Nāgārjuna now turns his attention to the properties of cessation and endurance. He begins, though, with a final remark on arising as a transition, concerning the relation between arising and cessation. This next verse must be read along with VII: 23 and 26. Together they constitute an exhaustive discussion of the possible inherence of the three properties under discussion in ceasing entities:
Kārikā VII.21

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 21 - Origination of a presently extinguishing entity is impossible. Moreover, it is equally impossible for a presently non-extinguishing entity.

JONES (Skt):
[21] The arising of something that is ceasing to be does not occur - but an entity that is not ceasing to be does not occur.

KALUPAHANA (Skt):
The arising of an existent that is ceasing is not appropriate. Whatever existent that is non-arising, that existent too is not appropriate.

MCCAGNEY (Skt):
The arising of a presently ceasing being does not occur. That being which is not now presently ceasing does not occur.

NISHIJIMA (Skt?):
21. In the regulated situations what has been realized has been manifested already, It does never manifest the appearance of itself in the area of existence at all. And which is never regulated by any kind of regulation at all. Therefore actually Existence itself does never manifest itself at all actually.

STRENG (Skt):
21. The origination of something being destroyed is not possible; And whatever is not being destroyed, that entity is not possible.

BOCKING (Ch):
7v22 At the moment of cessation of dharmas - At this point there should be no arising. And if dharmas have no cessation Then there is no question of arising at all.

BATCHELOR (Tb):
It is not tenable for a thing that is perishing to be born. It is not tenable for that which is not perishing to be a thing.

DOCTOR (Tb):
A thing that is currently ceasing Cannot reasonably arise. A thing that is not currently ceasing Cannot reasonably be a thing. [VII.21]

GARFIELD (Tb):
21. The arising of a ceasing thing Is not tenable. But to say that it is not ceasing Is not tenable for anything.

GARFIELD-SAMTEN (Tb):
21. The arising of an entity in the process of ceasing Is not tenable. Nor is it tenable that that which is not In the process of ceasing is an entity.

HAGEN (paraphrase):
The arising of an existent that is ceasing is not appropriate. Whatever existent that is non-arising, that existent too is not appropriate.
PINGALA COMMENTARY

7/22 If a dharma has the mark of cessation, then this dharma should not arise, and why? Because the two characteristics are mutually opposed. One is the mark of cessation by which we know that a dharma is ceasing, the other is the mark of arising, by which we know that a dharma is arising. The two marks are the opposite of each other, and they cannot co-exist simultaneously, so a dharma with the mark of cessation cannot arise.

(11a23) Question: Even though dharmas with the mark of cessation should not arise, surely dharmas without the mark of cessation may arise?

Reply: Since all active dharmas are ceasing every instant, there are no non-ceasing dharmas. Apart from active dharmas, there are no fixed, inactive dharmas. ‘Inactive dharma’ is merely a designation, and this is why we say that if dharmas do not cease this problem (of arising) does not occur.

Question: Even if dharmas have no arising, surely they have abiding?

Reply:

KALUPAHANA COMMENTARY

The theory discussed at VII.20 was the arising of a non-existent entity. The discussion now moves on to the question regarding the arising of an event that is ceasing. The Abhidharma interpreters recognized two types of causes (hetu) that provide a foundation for the causal efficacy of an event that is ceasing (nirudhyamane karitram dvau hetu kurutah, AK ii.63; AKB; also see definition of karistra at AD 321; Adv). Nagarjuna is reluctant to accept even the fact that an existent that is on its way to ceasing can arise. In other words, cessation and arising cannot be described as events taking place in relation to the same entity. Or more specifically, a changing substance is unacceptable to Nagarjuna. Similarly, one cannot speak of an entity that is not ceasing (anirudhyamana).

GARFIELD COMMENTARY

21. The first alternative Nāgarjuna considers is that a ceasing thing is arising. But if a thing is already ceasing, it is therefore no longer arising. And since all phenomena are, when their impermanence is taken into consideration, ceasing, it would follow that nothing can be said to be arising.
Kārikā VII.22

na sthitabhāvastiṣṭhatyasthitabhāvo na tiṣṭhati |
na tiṣṭhate tiṣṭhāmānāḥ ko ‘nutpannaś ca tiṣṭhati ||22||

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 22 - An entity which has arisen does not abide (i.e., endure) nor does an entity which has not arisen. A presently enduring entity also does not abide. How could something without origination abide?

JONES (Skt):
[22] An entity that has endured does not now endure, nor does an entity that has not endured, nor does the currently enduring, and how can what is not yet arisen endure?

KALUPAHANA (Skt):
An existent that has endured is not stationary, nor is an existent that has not endured. The presently enduring is not stationary. What non-arisen can stay?

MCCAGNEY (Skt):
No being that has endured stays, and a being that has not endured does not stay.
The presently enduring does not stay and so which nonarisen stays?

NISHIJIMA (Skt?):
22. What should not stop, has stopped, is called "existence," And the "existence," which has been stopped, does never stop once more.
The states, which are stopping, do never stop, And where is it possible for what hasn’t been born to stop actually?

STRENG (Skt):
22. Neither an "entity that has endured (iii)" (sthitabhava) nor an "entity that has not endured (i)" endures; Not even something enduring (ii) endures. And what endures if it is not originated?

BOCKING (Ch):
7v23 Non-abiding dharmas do not abide
Abiding dharmas do not abide either.
Nor does the moment of abiding abide.
Since they do not arise, how can they abide?

BATCHelor (Tb):
A thing that has remained does not remain. A thing that has not [yet] remained does not remain. That which is remaining also does not remain. What unborn [thing] can remain?

DOCTOR (Tb):
A thing that has abided does not abide,
A thing that has yet to abide does not abide,
And no currently abiding thing abides either.
What thing abides that does not arise? [VII.22]

GARFIELD (Tb):
22. A static existent does not endure.
A nonstatic existent does not endure.
Stasis does not endure.
What nonarisen can endure?

GARFIELD-SAMTEN (Tb):
22. An entity that has endured does not endure.
An entity that has not endured does not endure.
That which is in the process of enduring does not endure.
What non-arisen can endure?

HAGEN (paraphrase):
An existent that has endured is not stationary, nor is an existent that has not endured. The presently enduring is not stationary. What non-arisen can stay?
PINGALA COMMENTARY

7/23 Non-abiding dharmas do not abide because they have no mark of abiding. Abiding dharmas similarly do not abide, and why? Because they already have abiding. Abiding exists by virtue of movement. If a dharma of abiding already exists it will not need to abide again. There is no abiding, in the moment of abiding either, and since there is no moment of abiding apart from abiding and not abiding, there is no abiding. Even though you search everywhere in this way for abiding you will not be able to find it. It is the same as no arising, and if there is no arising, how can there be abiding?

Further.

KALUPAHANA COMMENTARY

The Sarvastivadins (especially the Vaibhasikas) argued that unless "stasis" (sthiti) of an entity (dharma) is not recognized, it causal efficacy also cannot be admitted (Adv). This is contrary to the view (referred to in VII.21) expressed by the Sautrantikas, namely, that an entity, when it is ceasing, can generate causal efficiency. Thus, while the Sautrantikas refused to recognize a moment of stasis fearing that it would lead to a belief in substance, the Sarvastivadins insisted upon admitting such a static moment. As such, the Sarvastivadins can maintain that a static moment endures (sthita-bhavah tisthati), primarily because they assumed that stasis has its own nature (svabhava). If there was no such nature, then phenomena could not endure. Here again, we have the distinction between a phenomenon and its static nature. What Nagarjuna is denying here is not that a phenomenon can endure, but that a static nature can endure (asthitabhavah tisthati)? This would appear to be self-contradictory to Nagarjuna. To say that "presently enduring is enduring" (tisthamanah tisthati) would be tautological.

All the above mentioned views would pertain to something that has already arisen. Finally, Nagarjuna insists that we cannot speak of a non-arisen entity as having stasis.

GARFIELD COMMENTARY

22. (“A static existent does not endure” fn 55. To translate the Tibetan “gnas-pa, “ I have used “stasis (static)” as a noun form, “to endure” as a verb (and sometimes “to abide” to emphasize, where context makes it appropriate, the dynamic character of this process). One should bear in mind that these diverse English terms do not mark diverse Tibetan (or Sanskrit) terms in the original. I have tried to be consistent in preserving the connotations that are important in each context and to render the text in as smooth English as possible. This precludes the otherwise desirable lexical uniformity one would achieve by using one of these terms throughout.)

Nāgārjuna now turns to stasis - the moment between arising and” ceasing. This verse must be read along with VII: 23, 25, and 27, which together provide a complete examination of the status of stasis. Here he emphasizes that the moment between the arising and ceasing of a momentary phenomenon - an event has no temporal extent. So a thing that we might conventionally refer to as static literally does not endure with identity through time. But of course neither does something that is not even conventionally static. And finally, since as a consequence of these two premises stasis is not instantiated in any phenomenon, it itself does not endure. So, Nāgārjuna concludes, stasis fails to exist over time in any sense and so is no candidate for an inherently existent phenomenon.
Kārikā VII.23

INADA (Skt):
Verse 23 - The abiding of a presently extinguishing entity is impossible. Indeed, the abiding of a presently non-extinguishing entity is equally impossible.

JONES (Skt):
[23] The duration of an entity that is ceasing to be does not occur. But an entity that is not ceasing to be does not occur.

KALUPAHANA (Skt):
Duration of an existent that is ceasing is not appropriate. Whatever existent that is non-ceasing is also not appropriate.

MCCAGNEY (Skt):
The endurance of a presently ceasing being does not occur. That being which is not now presently ceasing does not occur.

NISHIJIMA (Skt?):
23. Standing still is belonging to the state of self-regulation, And the self-regulation does not manifest itself in a simple condition of existence.
Such a kind of standing still is beyond the self-regulation totally, The Real Existence does never manifest itself at all.

STRENG (Skt):
23. Duration is not possible of a thing that is being destroyed. But whatever is not being destroyed, that thing (bhava) is also not possible.

ROBINSON (Skt):
Abiding of a vanishing existent is not true to fact; but no non-vanishing existent is a fact.

BOCKING (Ch):
7v24 When dharma are ceasing
They cannot be abiding
And if dharma do not cease,
The problem (of abiding) will not occur at all.

BATCHelor (Tb):
It is not possible for a thing that is perishing to remain. It is not possible for that which is not perishing to be a thing.

DOCTOR (Tb):
A thing that is currently ceasing Cannot reasonably abide. A thing that is not currently ceasing Cannot reasonably be a thing. [VII.23]

GARFIELD (Tb):
23. The endurance of a ceasing entity Is not tenable. But to say that it is not ceasing Is not tenable for anything.

GARFIELD-SAMTEN (Tb):
23. The endurance of an entity in the process of ceasing Is not tenable. Nor is it tenable that that which is not in the process of ceasing Is an entity.

HAGEN (paraphrase):
Duration of an existent that is ceasing is not appropriate. Whatever existent that is non-ceasing is also not appropriate.
PINGALA COMMENTARY

7/24 If a dharma has the mark of cessation, then this dharma will not have the mark of abiding, and why? Because in the one dharma there would be two contradictory marks, the first being the mark of ceasing, the second being the mark of abiding. It is not possible for abiding and ceasing to exist in the same time and place.

Therefore you cannot say that a dharma with the mark of ceasing is abiding.

Question: Surely if dharmas are not ceasing they can abide?

Reply: There are no dharmas which are not ceasing, and why?

KALUPAHANA COMMENTARY

While the Sautrantikas (as mentioned earlier) recognized causal efficiency in a phenomenon at the moment of its arising (utpada), and as such they did not have to accept a static moment, the Sarvastivadins argued that without a static moment a phenomenon cannot generate any causal efficiency (yadi hi dharmasya sthitir na syat, tasyatmanvavasthitasya hetvakhya saktiprabhavaviseso na syat, Adv). A moment of stasis is to be followed by decay (jara) and destruction (vyaya). If the Sarvastivadins were not happy about recognizing causal efficiency of a phenomenon at the moment of its arising, the moment being such a minute instant of time, they will be compelled to admit such causal efficiency in a static moment as it begins to disappear (nirudhyamana).

Nagarjuna's argument here is, therefore, directed against the Sarvastivadins when he says: "The duration of an existent that is presently ceasing is not appropriate." However, someone may assume that Nagarjuna's criticism of the Sarvastivada theory of stasis would mean that he is compelled to accept the contrary view, namely, that there is a phenomenon that is not ceasing (anirudhyamana). This latter view he rejects in the second line.

GARFIELD COMMENTARY

23. This verse plays a central role in each of two interwoven arguments. In the context of VII: 21 and 26, it provides part of the exhaustive analysis of the impossibility of arising, abiding and ceasing as instantiated in ceasing (hence in impermanent) phenomena. In the context of VII: 22, 25, and 27, it provides part of the analysis of the impossibility of locating endurance in any phenomenon, hence emphasizing the impermanence of all phenomena.

Since to exist is to exist in time and things that are ceasing are by definition not in a state of continued existence, ceasing phenomena do not provide the kind of continuity with numerical identity that endurance demands. And all phenomena are, upon analysis, seen to be constantly ceasing. So endurance has no possibility of instantiation, and ceasing phenomena cannot have this property as an essential attribute.
Kārikā VII.24

jarāmaraṇadharmeṣu sarvabhāveṣu sarvadā ||24||
tiṣṭhanti katame bhāvā ye jarāmaraṇaṃ vinā ||24||

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 24 - As all entities are always subject to the conditions (i.e., dharmas) of ageing and death, what entities abide which are not subject to the conditions?

JONES (Skt):
[24] When all things are always by nature decaying and dying, what things endure without decay and death?

KALUPAHANA (Skt):
When all existents are always of the nature of decay and death, which existents that are without decay and death can stay?

MCCAGNEY (Skt):
All of the beings always [experience] the events of old age and death. Where do which beings endure without old age and death?

NISHIJIMA (Skt?):
24. Aging and death are following the rule of the Universe, And they are belonging to the whole existence at every moment. How is it possible for everything to stop at all? Those existences do not have any aging, or any death.

STRENG (Skt):
24. Because every entity always remains in the law of old age and death, What entities are there which endure without old age and death?

BOCKING (Ch):
7v25 Every dharma which exists Has the marks of old age and death. You will never see any dharma Abiding without old age and death.

BATCHeloror (Tb):
If all things at all times are aging and dying phenomena, what things are there which could remain without aging and dying?

DOCTOR (Tb):
All things, at all times, Are subject to aging and death. What thing then remains Free from aging and death? [VII.24]

GARFIELD (Tb):
24. Inasmuch as the nature of all things Is aging and death, Without aging and death, What existents can endure?

GARFIELD-SAMTEN (Tb):
24. Inasmuch as the nature of all entities Is always aging and death, Without aging and death, What entities can endure?

HAGEN (paraphrase):
When all existents are always of the nature of decay and death, which existents that are without decay and death can stay?
PINGALA COMMENTARY

7/25 All dharmas at the moment of their arising are impermanent. Always accompanying impermanence are two things, namely old age and death. All dharmas are the same in this respect, and because old age and death are always present there is no moment of abiding.

Further.

KALUPAHANA COMMENTARY

This is a simple rejection of any metaphysical idea pertaining to the real stasis (sthiti) of phenomena. This rejection is based upon the empirical notions of decay and death (jara-marana) emphasized by the Buddha himself.

The interpreters of the Abhidharma seem to have experienced difficulty in reconciling the Buddha's description of the "dispositionally conditioned" (samskrta) as having three characteristics (trini laksanani) (A 1.152; Tseng 12.5 [Taisbo 2.607c]) with their own theories of momentariness. While the Sarvastivadins recognized a fourth moment (caturtham atra vaktavyam syat, Akb), splitting up "change of what has remained" (thitassa annathatta) into two moments as stasis (sthiti) and decay (anyathatva, jara), the Sautrantikas admitted only two moments rejecting both stasis and decay. The Theravadins accepted a theory of three moments, once again omitting decay.

The need for recognizing stasis on the part of the Sarvastivadins and its denial by the Sautrantikas is discussed at length by Vasubandhu (Akb p). Both schools assumed (and this is the case with the later Theravadin too) that the Buddha's definition of the "dispositionally conditioned" in terms of three characteristics (as arising, decay or change of what has remained, and ceasing) is for the sake of the unenlightened (vineyajanartham). They argued that it is for this reason that the Buddha utilized the term "appears" (pannayati, prajnayate) when speaking of these three characteristics. However, this is not the case with the Abhidharma theory of moments (na tu ksanasya).

The interpreters of the Abhidharma (hardly realizing that the Abhidharma did not have a theory of moments) were making a distinction between the "discourses" (sutra) and Abhidharma, comparable to the distinction made in the Saddharmapundarika between the Agama and Mahayana discourses. They assumed that the Abhidharma analysis (i.e., in terms of moments) is for those who really understand the "meaning" (arthajna), not for those who merely go after the "texts" (granthajna). Thus came to be established the definition of Abhidharma as containing "taintless wisdom" (prana 'mala sannca 'bhidharmah, AK i.21).

Nagarjuna seems to have remained undaunted by such claims on the part of the Buddhist metaphysicians. He was probably aware that all three metaphysical views presented by the Sarvastivadans, the Sautrantikas and the later Theravadin were incompatible with the Buddha's own conception of change explained in terms of decay and death (jara-marana). Therefore, he perceives no existents (bhava) that are free from decay and death.

GARFIELD COMMENTARY

24. Moreover, since all things decay, this analysis is perfectly general. Nothing exists in the way that it would have to in order to have endurance as part of its essence.
Kārikā VII.25

INADA (Skt):
Verse 25 - The abiding state of an entity is not justifiable on the grounds of another entity's abiding or by its own abiding. This is just as the origination of origination which is dependent neither on its own self nor on another.

JONES (Skt):
[25] The endurance does not endure through itself or through another endurance, just as arising does not arise through itself or another arising.

KALUPAHANA (Skt):
The endurance of an enduring thing based on the endurance of itself or of another is not proper. It is like the absence of arising of arising, either from itself or from another.

MCCAGNEY (Skt):
Enduring should endure with the having endured but neither of them is reasonable.

just as the arising of arising is not from itself or another.

NISHIJIMA (Skt?):
25. Standing still relying upon other things, is also a kind of standing still, and the state is confirmed much more stable. However even though relying upon such a method, the situation is never to be bound so much.
Belonging to the work is just working for the work itself, And it is not relying upon myself, or it is not relying upon others.

STRENG (Skt):
25. The enduring quality of a different duration is as impossible as of that same duration, So the origination of origination is neither itself nor that which is other than itself.

BOCKING (Ch):
7v26 Abiding is not abiding of its own marks, Nor is it abiding of the marks of something else Just as arising does not produce itself Nor does it produce the marks of anything else.

BATCHelor (Tb):
It is not reasonable for what remains to remain due to something else that remains or due to itself. This is like how what has been born is not given birth to by itself or another.

DOCTOR (Tb):
Abiding cannot reasonably abide Due to itself, or due to another.
The case was the same with arising, Which arises neither by itself nor through another. [VII.25]

GARFIELD (Tb):
25. Stasis cannot endure through itself Or through another stasis. Just as arising cannot arise from itself Or from another arising.

GARFIELD-SAMTEN (Tb):
25. For enduring to endure through another Enduring or through itself makes no sense, Just as arising cannot arise through itself Or through another arising.

HAGEN (paraphrase):
The endurance of an enduring thing based on the endurance of itself or of another is not proper. It is like the absence of arising of arising, either from itself or from another.
PINGALA COMMENTARY

7/26 If there were a dharma of abiding, then it could either be regarded as the abiding of its own marks or as the abiding of another thing's marks, but neither of these is correct. If it is its own marks which abide then it would be considered permanent. All active dharmas arise from causal conditions, and if a dharma of abiding were self-abiding, it would not be considered active. If abiding were the abiding of own marks, dharmas too ought to abide in their own marks. Just as the eye cannot see itself, so it is with abiding.

(11b24) If it is abiding of another thing's marks, that abiding would again have to abide, and abiding would be an endless regression. Moreover, we see different dharmas producing different marks, but we cannot find uncaused, different dharmas which nevertheless have different marks, because their different marks are not fixed. To say that there is abiding on the basis of different marks is not correct.

Question: If there is no abiding, surely there must be ceasing?

Reply: No, and why?

KALUPAHANA COMMENTARY

If stasis (sthiti) were to be a distinct event, then the metaphysicians who needed to explain such an event in terms of causality will have to maintain that it could occur either depending upon itself (= self-causation, svatotpatti) or based upon another (external causation, parata utpatti). Both are not appropriate. This is similar to the criticism made of arising at VII. 18-19.

GARFIELD COMMENTARY

25. This verse recalls the discussion of VII: 13-19 and has an important echo in VII: 32. Nāgārjuna argued earlier that we cannot analyze arising either as sui· generis or as dependent upon some other arising. In the first case, we beg the question; in the second we invite an infinite regress. He now points out that the same is true of stasis. We can’t, in order to demonstrate the inherent existence of stasis, argue that it endures because of itself. If this kind of reflexive explanation were possible, we would not need to posit stasis in the first place as an explanation of the continued existence of empirical phenomena. Each could count as self-explanatory. ‘But if we say that stasis, like other static things, is static because of its possessing a distinct stasis, we are off on a vicious regress.
Kārikā VII.26

Inada (Skt):
Verse 26 - That which has not extinguished does not extinguish. That which has extinguished does not extinguish also. This is also the case with that which is presently extinguishing. How could an entity which has not arisen extinguish itself?

Jones (Skt):
[26] What has not yet ceased does not cease, nor does what has already ceased, nor does the currently ceasing - and what not-arisen thing can cease?

Kalupahana (Skt):
That which has not ceased does not cease. That which has ceased also does not cease. Even so is that which is ceasing. Is it the unborn that ceases?

McCagney (Skt):
Neither that which has ceased ceases nor that which has not ceased ceases, so also the presently ceasing. What ceases that has not arisen?

Nishijima (Skt?):
26. What is not restricted would not be restricted, And what hasn’t been restricted wouldn’t be restricted. In such situations even the states, which have been restricted yet, How is it possible for what hasn't been born, to be restricted actually.

Streng (Skt):
26. "That which has ceased (iii)" (niruddha) does not cease; and "that which has not ceased (i)" does not cease; Nor even "that which is ceasing (ii)." For, what can cease if it is produced? (i.e. or if it is not really produced?)
PINGALA COMMENTARY

7/27 If a dharma has already ceased, it does not cease, because it has previously ceased. Similarly, if it has not yet ceased it does not cease, because it is without the mark of cessation. It does not cease at the moment of ceasing either, for apart from these (first) two there is no further 'moment of ceasing'. Thus, according to our investigation the dharma of cessation is nothing but non-arising, for where there is no arising how can there be ceasing?

Further.

KALUPAHANA COMMENTARY

After analysing the metaphysical concepts of arising (utpada) and stash (sthitt), Nagarjuna settles down to an examination of the problem of cessation or destruction (nirodha, vyaya). This criticism follows the method adopted at II. 1, excepting the final question: "Is it the unborn that ceases?" If cessation were to be understood in the sense of momentary cessation, it cannot be explained. However, if one were to accept a permanent and eternal substance (svabhava) which would, at the same time, be unborn (ajata), as the Sarvastivadins did, then that certainly cannot cease to exist.

GARFIELD COMMENTARY

26. Nāgārjuna thus completes the tripartite argument for the impossibility of the instantiation of arising, abiding, and ceasing begun in VII: 21 and 23. Cessation, conceived of as an inherently existent, independent property, needs a substratum. We have seen in the previous two verses in this argument that neither arising nor static things can provide this substratum. The only alternative remaining is the ceasing. But these phenomena, passing out of existence, are by definition not inherently existent and so fail as candidates. And again, since all phenomena are ceasing, this means that ceasing as an independent property has no basis. The argument here is an obvious echo of the argument against the inherent existence of motion. So the conclusion to draw is not that there is no cessation or that there are no ceasing phenomena. That would be crazy. Rather, neither cessation nor any impermanent phenomenon can be identified independently as an entity itself. Their existence is purely relational. Nāgārjuna now turns to the cessation of the static:

_____
Kārikā VII.27

INADA (Skt):
Verse 27 - In truth, the cessation of an abiding entity is not possible. Also, the cessation of a non-abiding entity is not possible.

JONES (Skt):
[27] Thus, the cessation of an enduring entity does not occur, nor does the cessation of an entity that has not endured.

KALUPAHANA (Skt):
The cessation of an existent that has endured is not appropriate. The cessation of an existent that has not endured is also not appropriate.

MCCAGNEY (Skt):
Therefore the cessation of the enduring being does not occur. Moreover, the cessation of a nonenduring being does not occur.

NISHIJIMA (Skt?):
27. As long as we are standing still, we can belong to the state of existence. The attitude of self-regulation does not appear without efforts to do. Even just not to stand still, belongs to existence, And the self-regulation manifests itself.

STRENG (Skt):
27. Therefore cessation of an enduring entity is not possible. Moreover, cessation of a non-enduring entity is not possible.

BOCKING (Ch):
7v28 If dharmas did abide
They could not cease.
If dharmas did not abide,
Then, too, they could not cease.

BATCHELOR (Tb):
It is not possible for a thing which has remained to cease. It is also not possible for a thing which has not remained to cease.

DOCTOR (Tb):
A thing that abides
Cannot reasonably cease,
Yet a thing that does not abide
Cannot reasonably cease either. [VII.27]

GARFIELD (Tb):
27. The cessation of what is static
Is not tenable.
Nor is the cessation of
Something not static tenable.

GARFIELD-SAMTEN (Tb):
27. The cessation of an entity that is enduring
Is not tenable.
Nor is the cessation of
An entity that is not enduring.

HAGEN (paraphrase):
The cessation of an existent that has endured is not appropriate. The cessation of an existent that has not endured is also not appropriate.
PINGALA COMMENTARY

7/28 If dharmas really did abide there would be no cessation, and be why? Because they would have the mark of abiding. If a dharma of abiding ceased there would be two marks, the mark of abiding and the mark of ceasing. Therefore, you cannot say that abiding contains ceasing, just as, in the same way being born and dying cannot exist simultaneously. But if dharmas do not abide, there is no cessation either, and why? Because they are without the mark of abiding. If they are without the mark of abiding then they are not dharmas, and not being dharmas, how can they cease?

Further.

KALUPAHANA COMMENTARY

As mentioned earlier, the Buddha's discourse pertains to "change of what has remained" (thitassa annathatta), where "what has remained" (thita) would not imply something that has remained static without any change, but rather "what has become" (bhuta, bhutva). What has become can then cease to exist. Thus, "change of what has remained" (namely, something that has undergone a process of change or transformationviparinama) can come to an end. Hence, it is meaningful to speak of cessation (vaya) after "change of what has remained" (thitassa annathatta).

However, this is not the case with stasis (sthiti) as explained by the metaphysicians, primarily because such stasis was distinguished from change (anyathatva). As such, stasis implied that something remains static, without change, for a while and then without any cause or reason it would suddenly start changing or would cease to exist. This is the implication of the theory referred to in the first line which is not acceptable to Nagarjuna.

The second line implies the equally metaphysical and unacceptable view of the Sautrantikas who argued that an event ceases immediately upon arising without remaining even for one moment (ksanikasya hi dharmasya vina sthitya vyayo bhavet, Akb).

GARFIELD COMMENTARY

27. Two points are being made here: First, if there were intrinsically real entities that could serve as ontological bases for cessation, they would have to have either remained stable or not. If the former, then in virtue of having the nature of stasis, they would be incapable of cessation. If the latter, since they never really existed, there is nothing to cease. But there is also a second point being made that depends upon the conventional reality of cessation. Since cessation is conventionally real and is incompatible both with inherently existent stasis and with there being no stasis at all, both of these alternatives with respect to stasis are eliminated. Cessation and stasis must be understood relatively and not absolutely. This point is reiterated in the following verse:
Kārikā VII.28

tāyai vāsthayāvasthā na hi saiva nirudhyate | anyayāvasthayāvasthā na cānyaiva nirudhyate ||28||

shi fā yū; yū; wū shì shí bù yū; yū; wū shì shí miè
shi fā yū; yū; yì shì bù yū; yū; wū yì shí miè

(4) gnas skabs de yis gnas skabs ni || de ñid 'gag pa ñid mi 'gyur ||
gnas skabs gzan gyis gnas skabs ni || gzan yañ 'gag pa ñid mi 'gyur |

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 28 - From its abiding state, surely, the same state does not extinguish itself. Also, from another abiding state, that state does not extinguish itself.

JONES (Skt):
[28] Indeed, a given state does not cease by means of that state, nor does it cease by means of another state.

KALUPAHANA (Skt):
Indeed, a certain state [of existence] does not cease from a state identical with its own. Nor does a state [of existence] cease from another state different from its own.

MCCAGNEY (Skt):
Indeed, a state does not cease on account of itself, and a state does not cease on account of another state.

NISHIJIMA (Skt?):
28. Relying upon such a real situation, the balanced situations have become balanced, Because the real situations themselves are never be regulated by themselves., Utilizing a differently balanced situations, are just the true situations, And it is never the different one, which is really self-regulated.

STRENG (Skt):
28. Indeed, a state of existence does not cease because of this state; And a different state of existence does not cease because of a different state.

BOCKING (Ch):
7v29 A certain dharma, at a certain moment
Does not cease in that same. moment
A certain dharma, at another moment
Does not cease in that other moment.

BATCHelor (Tb):
A particular state [of something] does not cause that particular state itself to cease. Moreover, another particular state does not cause that particular state to cease.

DOCTOR (Tb):
The same state does not Bring an end to itself
Nor is it that a different state Makes the initial one cease. [VII.28]

GARFIELD (Tb):
28. Being static does not cease Through being static itself.
Nor does being static cease Through another instance of being static.

GARFIELD-SAMTEN (Tb):
28. A state does not make That state itself cease.
Nor does one state Make another state cease.

HAGEN (paraphrase):
Indeed, a certain state [of existence] does not cease from a state identical with its own. Nor does a state [of existence] cease from another state different from its own.
PINGALA COMMENTARY

7/29 If a dharma has the mark of ceasing, then either this dharma's ceasing is a mark belonging to itself, or its ceasing is a mark of something else, but neither is correct, and why? As an example, milk does not cease at the moment when it is milk, for while it is milk the mark of milk definitely abides. At the time when it is not milk, it does not cease either, since if it is not milk you cannot say that it is ceasing to be milk.

Further.

KALUPAHANA COMMENTARY

The principles of self-causation (svata-utpatti) and external causation (paratautpatti), rejected in Chapter I, may have to be adopted in order to explain cessation itself (niruddha), if the latter were to be understood in the way the Sarvastivadins and the Sautrantikas conceived of it. Either cessation will have to occur on its own, or on the basis of another. Such discussions were rampant during the scholastic period in Indian philosophy (especially with the domination of the doctrine of momentariness) when it was argued as to whether destruction is inherent in birth or whether it is brought about by external causes or conditions (see Adv p-108). Nagarjuna's rejection applies to both views.

GARFIELD COMMENTARY

28. This verse also echoes VII: 25 and that discussion of the impossibility of arising being either self-explanatory or always explained by reference to yet another arising. All things, having remained momentarily in existence, change constantly. This, however, cannot be explained by reference to the nature of stasis, either reflexively or regressively.

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 29 - As the origination of all dharmas (i.e., factors of existence) is not possible, so, also, is the cessation of all dharmas.

JONES (Skt):
[29] When the arising of all things does not occur, then the cessation of all things does not occur.

KALUPAHANA (Skt):
Indeed, when the arising of all things is not appropriate, then the cessation of all things is also not appropriate.

MCCAGNEY (Skt):
When the arising of all events does not take place, then the cessation of all events does not happen.

NISHIJIMA (Skt?):
29. Just at that time, everything is all things and phenomena in the whole Universe,
And what has appeared already, does never appear again,
Just at that moment everything is just all things and phenomena in the Universe,
And the self-regulation can never be seen from outside at all.

STRENG (Skt):
29. So, if the production of all dharmas is not possible, Then neither is the cessation of all (i.e. any?) dharmas possible.

ROBINSON (Skt):
When the arising of all the dharmas is not a fact, then the extinction of all the dharmas is not a fact.

BOCKING (Ch):
7v30 It is the same with all dharmas; No mark of arising can be found Because of the mark of non-arising. There is also the mark of no-ceasing.

BATCHELOR (Tb):
When the birth of all phenomena is not possible, then the cessation of all phenomena is not possible.

DOCTOR (Tb):
When no phenomenon’s arising Makes any sense, No phenomenon’s cessation, Makes any sense either. [VII.29]

GARFIELD (Tb):
29. When the arising of any entity Is not tenable, Then the cessation of any entity Is not tenable.

GARFIELD-SAMTEN (Tb):
29. Since for no entity Is arising tenable, For no entity Is ceasing tenable.

HAGEN (paraphrase):
Indeed, when the arising of all things is not appropriate, then the cessation of all things is also not appropriate.
7/30 As found in the foregoing investigation, no mark of arising can be discovered in any dharma, and at the same time there is no mark of cessation. We have refuted arising, and therefore there is no arising. Since there is no arising, how can there be ceasing? If your mind is still undecided, I will now expound further reasons for cessation to be denied.

KALUPAHANA COMMENTARY

Note that the term sarva (all) is used as an adjective of dharma, but not utpada (arising). This means that Nagarjuna is not rejecting all forms of arising (sarvautpada) as being unsatisfactory. Rather, he is critical of utilizing the conception of arising (utpada), discussed previously, to any or all phenomena (dharma). If arising in a metaphysical sense cannot be applied to all phenomena, then cessation (nirodha) too, similarly conceived, is inapplicable.

GARFIELD COMMENTARY

29. Since nothing arises inherently, nothing ceases inherently. Since upon careful examination nothing withstands analysis as an inherently existing phenomenon, nothing remains independent of conventional designation to be characterized as arising or ceasing. This is how it goes from the ultimate standpoint. From that standpoint - though achieved by noting the universality of arising and cessation of conventional phenomena - since there are no phenomena, there is no arising and cessation. But by contraposition we get the corelativity and mutual entailment of arising and ceasing at the conventional level.
INADA (Skt):
Verse 30 - In truth, the cessation of a real existing entity is not possible. For, indeed, it is not possible to have the nature of both existence and non-existence at the same time.

JONES (Skt):
[30] So too, to claim the cessation of a self-existent entity is not tenable. Indeed, it is not tenable to claim an entity and the absence of an entity in a context of oneness.

KALUPAHANA (Skt):
Furthermore, the cessation of a real existent is not appropriate. Indeed, in the context of identity, neither existence nor non-existence is appropriate.

MCCAGNEY (Skt):
Therefore, the cessation of a being that exists does not take place. In identity, indeed, neither a being or a non-being happen.

NISHIJIMA (Skt?):
30. From what really exist, an adequate volume belong to existence, What is adequately self-regulated, does not manifest itself at all. The fact that something is just only one, does not suggests its existence, And if it is true, the non-existence of number can never be found at all.

STRENG (Skt):
30. Therefore cessation of a real existing entity is not possible; And certainly both an existing entity and a non-existing entity cannot be possible in the same case.

ROBINSON (Skt):
The extinction of a real existent is not true to fact, since that existent and inexistenent occur in a unity is not true to fact.

BOCKING (Ch):
7v31 If a dharma is existent. Then there is no cessation. There could not be in one dharma The marks of both being and non-being.

BATCHelor (Tb):
Cessation is not possible in an existent thing. Thingness and nothingness are not possible in one.

DOCTOR (Tb):
A thing that exists Cannot have a cessation, Because the same thing cannot Be both thing and no thing. [VII.30]

GARFIELD (Tb):
30. For an existent thing Cessation is not tenable. A single thing being an entity and A nonentity is not tenable.

GARFIELD-SAMTEN (Tb):
30. For an existent entity Cessation is not tenable. A single thing being an entity and A nonentity is not tenable.

HAGEN (paraphrase):
Furthermore, the cessation of a real existent is not appropriate. Indeed, in the context of identity, neither existence nor non-existence is appropriate.
PINGALA COMMENTARY

7/31 When a dharma is existent you may seek for a mark of cessation but you will not be able to find it, and why? How could there be, within one dharma, the marks of both being and non-being? They are like light and shadow which cannot occupy the same place.

Further.

GARFIELD COMMENTARY

30. This verse and the next reinforce the point about the ultimate nonexistence of cessation and, by implication, of arising and stasis. In the preceding, Nāgārjuna emphasizes that for an inherently existent entity to cease to exist would be for it to inherently exist and not exist. In the subsequent verse, he points out that it makes no sense for a nonexistent thing to cease to be, just as it makes no sense to behead someone a second time:
Kārikā VII.31

Asato 'pi na bhāvasya nirodha upapadyate |
na dvitīyasya śirasaś chedanaṃ vidyate yathā ||31||

Ruò fà shì wú zhè shì jí wú yǒu miè |
pì rú dì èr tóu wú gù bù kē duàn

| dīos po med par gyur pa la’a’n | | ’gag pa ’thad par mi ’gyur ro | |
mgo gñis pa la ji ltar ni | | gcad du (6)med pa de bźin no |

ENGLISH TRANSLATIONS

INADA (Skt): Verse 31 - The cessation of an unreal existing entity is also not possible. It is as if the severance of a second head (of a person) is inconceivable.

JONES (Skt): [31] In addition, the cessation of a not-truly-existing entity is not tenable, just as a second beheading of a person does not occur.

KALUPAHANA (Skt): The cessation of an unreal existent is also not appropriate, just as a second beheading [of a person] is not evident.

MCCAGNEY (Skt): And the cessation of a being that does not exist does not take place, just as a second beheading does not occur.

NISHIJIMA (Skt?): 31. Even the non-existence of Reality, has begun to be existent, Even the denial of existent everything can be possible, The highest one can never be included into the second-class levels at all. The perfect destruction can be recognized in such a situation.

STRENG (Skt): 31. Even more, cessation of a non-real existing entity is not possible. Just as there is no second decapitation!

ROBINSON (Skt): Neither is the extinction of an unreal existent a fact, just as the cutting off of a second head is not a fact.

BOCKING (Ch) 7v32 If a dharma is non-existent Then there is no cessation Just as, not having a second head You cannot cut it off.

BATCHelor (Tb): Cessation is not possible also in what is not a thing. This is similar to how there is no cutting off a second head. [i.e. a person cannot be beheaded twice]

DOCTOR (Tb): A thing that does not exist Cannot have a cessation, Just as it is impossible To cut off a second head. [VII.31]

GARFIELD (Tb): 31. Moreover, for a nonentity, Cessation would be untenable. Just as a second beheading Cannot be performed.

GARFIELD-SAMTEN (Tb): 31. Moreover, for a nonexistent entity Cessation would be untenable. Just as a second head Cannot be cut off.

HAGEN (paraphrase): The cessation of an unreal existent is also not appropriate, just as a second beheading [of a person] is not evident.
PINGALA COMMENTARY

7/32 If a dharma is non-existent, there is no characteristic of cessation. It is like a second head or a third hand – not having them, you cannot cut them off.

Further.

KALUPAHANA COMMENTARY

Nagarjuna's criticism so far has been confined to arising, stasis and ceasing metaphysically conceived as events in themselves. In the present contexts, he returns to the criticism of the cessation of real existents (satah bhavasya), similar to the criticism of the real existents in Chapter I. Neither existence or nonexistence, nor a combination of both, are acceptable to him.
Kārikā VII.32

Inada (Skt):
Verse 32 - There is no cessation by itself or by another entity. It is just as the origination of origination does not arise by itself or by another.

Jones (Skt):
[32] Cessation does not cease because of itself nor because of something else, just as the arising of arising is not because of itself or because of something else.

Kalupahana (Skt):
There is no cessation by itself or by another entity, just as the arising of arising is neither by itself nor by another.

McCagney (Skt):
There is no cessation on account of itself or on account of another, just as the arising of arising is not out of itself or out of another.

Nishijima (Skt?):
32. Without the self-mind, the self-regulation does never exist, and the self-regulation is never also the same as the objective mind.
What kind of appearance does belong to the appearance? The appearance is never the subjective mind, or the objective mind.

Streng (Skt):
32. There is no cessation by means of itself; nor cessation by something other than itself; Just as there is no origination of origination by itself nor by another.

Bocking (Ch):
7v33 A dharma does not cease by virtue of its own marks, Nor by the marks of something else. Just as there is no arising from own marks Nor arising from the marks of another.

Batchelor (Tb):
Cessation does not exist by its own self, nor does cessation [exist] by something else. This is like how what has been born is not given birth to by itself or another.

Doctor (Tb):
Cessation is neither brought about By itself nor by anything else, Just as arising is not produced By itself or something else. [VII.32]

Garfield (Tb):
32. Cessation does not cease by means of itself. Nor does it cease by means of another. Just as arising cannot arise from itself Or from another arising.

Garfield-Samten (Tb):
32. Cessation does not exist through itself. Nor does it exist through another. Just as arising is given rise to Neither by itself nor by another.

Hagen (paraphrase):
There is no cessation by itself or by another entity, just as the arising of arising is neither by itself nor by another.
PINGALA COMMENTARY

7/33 As previously explained in relation to the mark of arising; arising does not produce itself, nor does it arise from something else. To say that it arises out of its own substance would be incorrect, for everything is produced by causal conditions, and just as a finger tip is unable to touch itself, so arising cannot produce itself. Arising from some other source is also wrong, and why? When arising has not yet occurred, there should be no arising from anything else. Since there is no such arising, there is no self-substance, and since there is no self-substance there is likewise no other, thus arising from another is incorrect. The dharma of cessation is also like this: there is no cessation by own marks or by marks of others.

Further.

KALUPAHANA COMMENTARY

This is the final criticism of the identity and non-identity theories as applied to the idea of cessation (nirodha). It is comparable to the criticism of arising (utpada) presented at VII. 12.

GARFIELD COMMENTARY

32. This verse has an exact parallel in VII: 25. Again, Nāgārjuna recalls the uncomfortable choice between a trivially begged question and a vicious regress presented originally in the context of the discussion of arising and recalled in the discussion of stasis. The argument applies, mutatis mutandis, to cessation. The conclusion of this trio of arguments is that we cannot conceive of any of the three characteristics of dependent arising as self-grounded. All must be understood dependently and hence as empty.
Kārikā VII.33

उत्पादस्थितिभव्यांगमसिद्धेनावस्ति संस्कृतम्।
संस्कृतस्याप्रसिद्धीं च कथं सौरस्यसंस्कृतम्॥३३॥

生住滅不成 故無有有為
有為法無故 何得有無為

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 33 - As the establishment of origination, duration and
cessation is not possible there is no created realm. Without
the establishment of the created realm, how then will the
uncreated realm come about?

JONES (Skt):
[33] Because arising, enduring, and cessation cannot be
established, there is nothing conditioned. And when the
conditioned cannot be established, how can the
unconditioned be established?

KALUPAHANA (Skt):
With the non-establishment of arising, duration, and
destruction, the conditioned does not exist. With the
non-establishment of the conditioned, how could there
be the unconditioned?

MCCAGNEY (Skt):
With the non-establishment of arising, duration, and
destruction, conditioning does not exist.
Where there is no establishment of conditioning, how will
the unconditioned be proved?

NISHIJIMA (Skt?):
33. Appearance, continuity, and distraction,
This world does never exist as some thing unfinished.
In this world there is anything unfinished actually,
How is it possible for unfinished world will be finished in future?

STRENG (Skt):
33. Because the existence of production, duration, and
cessation is not proved, there is no composite product
(samskrta); And if a composite product is not proved,
how can a non-composite product (asamskrta) be
proved?

ROBINSON (Skt):
Because arising, abiding, and perishing are not established,
there is no conditioned; since the conditioned is not
established, how can the unconditioned be established?

BOCKING (Ch):
7v34 Arising, abiding and ceasing not being established,
There is consequently no activity
Since there are no active dharmas
How can there be inactive ones?

BATCHelor (Tb):
Because birth and remaining and perishing are not
established, there is no conditioned. Because the
conditioned is utterly unestablished, how can the
unconditioned be established?

DOCTOR (Tb):
As arising, abiding, and cessation are not established,
There is nothing that is conditioned.
Since the conditioned lacks any establishment,
How could the unconditioned be established? [VII.33]

GARFIELD (Tb):
33. Since arising, enduring, and ceasing
Are not established, there are no compounded things.
If all compounded things are unestablished,
How could the uncompounded be established?

GARFIELD-SAMTEN (Tb):
33. Since arising, enduring, and ceasing
Do not exist, there are no produced things.
If no produced things exist,
How could the unproduced exist?

HAGEN (paraphrase):
With the non-establishment of arising, duration, and
destruction, the conditioned does not exist. With the
non-establishment of the conditioned, how could
there be the unconditioned?

GOLDFIELD (Tb):
Arising, abiding, and ceasing do not exist,
And therefore there are no composite things.
Since composite things are utterly nonexistent,
How could anything noncomposite exist? (33)
PINGALA COMMENTARY

7/34 You earlier stated that activity existed because of the marks of arising, abiding and ceasing. It is because of activity that there is inactivity. We have now shown by reasoned investigation that these three marks are untenable, so how can you say that there is activity? As we said before, there exist no dharmas without marks. Since there are no active dharmas, how can there be inactive dharmas? The characteristics of the inactive are non-arising, non-abiding and non-ceasing.

Stopping of the marks of activity is what is meant by 'the characteristics of inactivity'. The inactive has no special marks of its own; the marks of the inactive are contingent upon these three marks. For example, heat is the mark of fire, hardness is the mark of earth, and coldness is the mark of water, but the inactive is not like this.

Question: If these (marks of) arising, abiding and ceasing are absolutely non-existent, how can you speak their names in this treatise? Reply.

KALUPAHANA COMMENTARY

Arising (utpada), stasis (sthiti), and destruction (bhanga), as explained by the metaphysicians, would not establish their conception of the "conditioned" (samskṛta). If the "conditioned", so conceived, is not established, indeed there cannot be a similarly formulated conception of the "unconditioned" (asamskṛta). One very significant fact that cannot escape a careful scrutiny of the contents of this entire chapter is that, while Nagarjuna has specifically criticized the three kinds of events (arising, stasis, and ceasing), he has made no criticism whatsoever of decay (jara). In fact, at VII.24, decay and death (jara-marana) were used as arguments for the rejection of stasis (sthiti). In short, the Buddha's own conceptions of arising (uppada), ceasing (vaya, nirodha), change of what has remained (thitassa annathatta), decay (jara), impermanence (anicatta) have been left intact. These have no room for a substantial entity (an atman, a svabhava) and are indeed compatible with the Buddha's famous doctrine of non-substantiality (anatta). There could be no reason why a philosopher of Nagarjuna's calibre could not distinguish the empirical nature of the Buddha's analysis of the "characteristics of the dispositionally conditioned" (sankhatassa sankhata-lakkhanani) from the metaphysical character of the ideas expressed by the interpreters of the Abhidharma.

GARFIELD COMMENTARY

33. That is, arising, abiding, and ceasing are not entities at all - they are mere relations. Since these fundamental attributes of dependently arisen phenomena are empty of inherent existence, what could have inherent existence?
Kārikā VII.34

yathā māyā yathā svapno gandharvanagaraṃ yathā
tathotpādas tathā sthānaṃ tathā bhaṅga udāhṛtam ||34||

如幻亦如夢 如乾闥婆城
所說生住滅 其相亦如是

yathā māyā yathā svapno gandharvanagaraṃ yathā |
tathotpādas tathā sthānaṃ tathā bhaṅga udāhṛtam ||34||

rú huàn yì rú mèng rú qián tà pó chéng
suǒ shuì shēng zhù miè qí xiàng;xiāng yì rú shì

INADA (Skt):
Verse 34 - It is like an illusion, a dream, or an imaginary city in
the sky. In such a way, (the concepts of) origination,
duration, and cessation have been described.

JONES (Skt):
[34] Like an illusion, or a dream, or the castle in the sky of the
Gandharvas (heavenly musicians), so have arising,
durability, and destruction been explained.

KALUPAHANA (Skt):
As an illusion, a dream, a city of the gandharvas, so have
arising, endurance and destruction been exemplified.

MCCAGNEY (Skt):
As illusion, as dream, as an imaginary city in the sky,
so have arising, endurance, and destruction been illustrated.

NISHIJIMA (Skt?):
34. For example the supernatural power, for example a dream,
A fantastic city in the sky, called Gandharva, for example.
Similarly in the case of appearance, similarly in the case of stable
situations,
And similarly a very big distraction has been spoken as a rumor.

STRENG (Skt):
34. As a magic trick, a dream or a fairy castle. Just so
should we consider origination, duration, and
cessation.

ROBINSON (Skt):
Like an illusion, like a dream, like a fairy castle, thus is
arising, thus is abiding, thus is perishing declared to be.

BOCKING (Ch):
7v35 Like an illusion, like a dream
Like a Gandharva-city;
The arising, abiding and ceasing of which we speak
Have marks such as these.

BATCHelor (Tb):
Like a dream, like a magician’s illusion, like a city of
gandharvas, likewise birth and likewise remaining,
likewise perishing are taught.

DOCTOR (Tb):
Like a dream, like an illusion,
Like a city of scent-eaters—
This is how arising, abiding,
And cessation are taught to be. [VII.34]

GARFIELD (Tb):
34. Like a dream, like an illusion,
Like a city of Gandharvas,
So have arising, abiding,
And ceasing been explained.

GARFIELD-SAMTEN (Tb):
34. Like a dream, like an illusion,
Like a city of Gandharvas,
So have arising, enduring,
And ceasing been explained.

HAGEN (paraphrase):
As an illusion, a dream, a city of the gandharvas, so
have arising, endurance and destruction been
exemplified.

GOLDFIELD (Tb):
Like a dream, like an illusion,
Like a city of gandharvas,
That’s how birth and that’s how living,
That’s how dying are taught to be. (34)
Just as the acts of an illusionist should not be censured, arising, abiding and ceasing should not deserve criticism, because of his motive. There should be no feelings of grief or joy in this regard; one should simply see with one's eyes and that is all, just as one should not seek in the real world for something seen only in a dream, and just as, for example, a Gandharva-city, manifesting with the sunrise is not real, but merely a conventional designation which soon ceases to be. 'Arising,' 'abiding' and 'ceasing' are also like this. The unenlightened man differentiates them as existents; the sage investigates and finds them untenable.

If the analysis of the contents of the present chapter is correct, then there could be no question that the illusory character as exemplified by "dream" and "the city of the gandharvas" is applicable only to the metaphysical ideas of arising, stasis and ceasing as presented by the interpreters of the Abhidharma, and not to any one of the concepts of arising, ceasing, decay, change, and impermanence formulated by the Buddha and accepted by Nāgārjuna himself.

The Buddha utilized the similies of foam (phena), bubble (bubbulā), mirage (marici), trunk of a plantain tree (kadali), and illusion (maya) in order to illustrate the non-substanciality of the five aggregates (S 3.142). Nagarjuna is here using comparable similies for the same purpose. A careless applicaton of these similies to explain all forms of ideas, whether substantialist or non-substantialist, has given rise to enormous misunderstandings relating to the Buddhist doctrine.

This is a deep result. It again presages the doctrine of the emptiness of emptiness that is made explicit in Chapter XXIV, and it develops further the theme explored in Chapter I, namely, that when from the Madhyamika perspective one asserts that a thing is empty or that it is dependently arisen, one is not contrasting their status with the status of some other things that are inherently existent. Nor is one asserting that they are merely dependent on some more fundamental independent thing. Nor is one asserting that instead of having an independent essence things have as their essence dependence or emptiness, either or both of which exist in some other way. Rather, as far as one analyzes, one finds only dependence, relativity, and emptiness, and their dependence, relativity, and emptiness.

But this is not to say either that emptiness, dependent arising or conventional phenomena are nonexistent - that they are hallucinations. Indeed it is to say the opposite. For the upshot of this critical analysis is that existence itself must be reconceived. What is said to be "like a dream, like an illusion" is their existence in the mode in which they are ordinarily perceived/conceived - as inherently existent. Inherent existence simply is an incoherent notion. (fn 57. Compare Wood (1994), who misses the structure of this simile. The respect in which dependently arisen things are like a dream is this: They exist in one way (as empty) and appear to exist in another (as inherently existent). Just as dreams and mirages exist in one way (as illusions) and appear to exist in another (as objects of perception, or as water). But dreams and mirages are real dreams and mirages. So this verse should not be interpreted as asserting the complete nonexistence of all phenomena.)

The only sense that "existence" can be given is a conventional, relative sense. And in demonstrating that phenomena have exactly that kind of existence and that dependent arising has exactly that kind of existence, we recover the existence of phenomenal reality in the context of emptiness. In the next major section, comprising Chapters VIII through XIII, Nāgārjuna addresses the emptiness of the subject of experience.
Chapter VIII

Chapter VIII: Examination of the Agent and Action
Chapter VIII
MAJBA (TOPICAL OUTLINE)

Chapter Eight: Analysis of Action and Agent

1. The chapter's context
2. The content of the chapter
3. Summary

1. Refuting the natural establishment of action and agent
2. Explaining their merely conventional, mutually dependent establishment
3. Extending this analysis to other topics

1. Actions and agents that are of the same ontological status
2. Actions and agents that are of a different ontological status

1. The notion that an agent performs an action
2. The notion that what is not an agent performs what is not an action

1. The thesis
2. Its rationale

1. Stating the absurd consequence that action and agent would have no causes
2. Pointing out why this cannot be accepted

1. How this consequence entails the nonexistence of cause and effect
2. This would also entail the disappearance of all worldly conventions

3. The notion that something that both is and is not an agent performs what both is and is not an action

1. The thesis
2. Its rationale

1. Pairing a single agent with a single action of different status
2. Treating the agent in relation to two actions that are of a different status

1. The notion of an agent that performs a nonaction, or something that both is and is not an actual action
2. The notion of a nonagent performing an action, or something that both is and is not an action
3. The notion that something that both is and is not an agent performs an action or a nonaction
The person driven by ignorance assembles meritorious dispositions, nonmeritorious dispositions and unshakable dispositions. [Salistambha-sutra, mDo sde tsha 120a]

The agent of action, his action, and its effect—such things as consciousness—are thus presented.

The refutation of this statement has three parts: the refutation of agent and action existing inherently, the mode of positing action and agent conventionally, and applying the argument to other phenomena.

SUMMARY:

So it should be ascertained that if actions and agents were not merely conceptually posited as existent, and if instead were inherently existent [206] as they are taken to be, no agent or action would be tenable, and it should be understood that they exist merely in mutual dependence.

INADA (Chapter Introductions)

CHAPTER VIII - Examination of the Doer and the Deed

This chapter brings to sharp focus the Buddhist conceptions of the doer (karaka) and his deed (karma) in order to correctly understand the workings of the dharmas in the realm of created elements. In discussing the two concepts, Nagarjuna introduces the metaphysical notion of a thing in its finished or completed state as well as its unfinished or incompleted state and attempts to illustrate the various possible conditions expressible and assignable with respect to the doer and his deed. But all these conditions, which are taken up in turn, are untenable. The ultimate standpoint is that of the dynamics of relational structure which occurs in Verse 12 and which is an important link with the Madhyamika Credo. The final verse speaks of the various other phenomena which can be examined similarly as that of the doer and his deed, thus projecting into and anticipating the next two chapters which discuss, respectively, the former or antecedent state of an entity and the relationship between fire and wood.

In looking over the verses it would be worth noting that Candrakirti, in reference to the initial verse, discusses an interesting contrast between the completed and incompleted states of the doer and his deed. It illustrates the two alternatives in which these terms are related as follows:

The completed state is accompanied by function while the incompleted state is not. Yet, in discussing either the doer or the deed, the function represents a third concept. And furthermore, as the first verse below clearly indicates, the status of any entity in a completed or incompleted state cannot issue forth another entity.

KALUPAHANA (CHAPTER OVERVIEWS)

8. Action and agent (karma-karaka). While “dependently arisen (pratityasamutpanna) phenomena imply a process of natural occurrence “unconditioned by dispositional tendencies” (asamsktra) on the part of human beings, “dispositionally conditioned” (samsktra) phenomena are the results of human deliberations (samskara) or actions (karma). For this reason, after clarifying the notions of the “conditioned” and the “unconditioned,” it was natural for Nagarjuna to take a look at the notions of action (karma) and agent (karaka). If these two were found to be real in a substantialist sense, then the lengthy analysis of “conditioned” phenomena in the previous chapter would appear faulty.

Therefore, Nagarjuna begins with a substantial agent (sadbhuta karaka) who performs a substantially existing action (sadbhuta karma) and his analysis demonstrates that such an agent as well as such an action, in fact, logically lead to a denial of action (kriya), agent (kartr) as well as a cause (karana).

Verse VIII. 5 represents an unequivocal assertion on the part of Nagarjuna that such a substantialist view not only leads to the denial of action, etc., but also to an abandoning of discriminations and distinctions such as good (dharma) and bad (adharma) that are so relevant to the Buddha’s conception of fruits (phala) of life, both worldly (= heavenly, svarga) and ultimate (= freedom from suffering, moksa). Not only the goal or fruit of life, but also the path that leads thereto or all the actions that produce such fruits, would thereby be rendered useless or meaningless (nairarthakyam).
The statement at VIII.12 that both action and agent are dependently (pratitya) arisen and that there is no other perceivable manner in which these could be established (nanyat pasyamah siddhikaranam) stands as an eloquent testimony to Nagarjuna’s vindication of the empirical standpoint of the Buddha and of early Buddhism.

**BATCHelor (Poetic “Translation”)**

Actors

Real actors do not perform real acts
Nor unreal actors unreal acts.
Real actors are inactive;
Real acts need no actors.

Real actors do not perform unreal acts
Nor unreal actors real acts.
Unreal acts and unreal actors
Need no causes.

No causes –
No causality.
No causality –
No activity, actors or performance.
No performance -
No good and bad.

Unreal real actors
Do not perform real unreal acts:
Reality and unreality
Cancel each other out.

Actors depend on acts
And acts depend on actors -
I cannot see it otherwise.

When acts and actors vanish,
You understand clinging
And everything else.

**JoNEs (Commentary)**

8. Action and the One Who Acts

Here Nagarjuna draws out the impossibility of our actions if all things are self-existent. The analysis is straightforward: if a person is self-existent, he or she could not change, but any type of action is by definition always a change - so the action and person must be distinct, with the action having no agent and the person no activity (vv. 1-2). An actor who is not real (self-existent) cannot perform a real act, and so any alleged act would be without a cause; the actor, being unreal, would also not have a real cause (v. 3). Indeed, there would be no action or actor if a metaphysics of self-existence prevailed (v. 4). But such a metaphysics clearly conflicts with what we see in the world and so cannot be accepted. (There would also be no real actor since action is not real under an emptiness metaphysics [SS 38], but at least this metaphysics allows change and interaction.) Verses 5-6 draw the conclusion relevant to the Buddhist soteriological goal of liberation: religiously propitious actions would be impossible.

Notice that verses 1 and 8 only together cover the basic four possibilities of a truly existing actor, a non-truly existing actor, a truly existing act and a non-truly existing act. In Nagarjuna’s analysis, neither type of actor can produce either type of act - for if the act is real it exists in its own right and is not produced, and a non-truly existing act is not real and so is not produced. So too, if the actor is real, he or she is permanent and so cannot act since that is a type of change; and if the actor is not real, he or she does not exist and so there is nothing real to change.

Verses 12-13 set forth the position that the concepts of “actor” and “action” are intertangled, and so neither can be established as an independently real entity. So too, as discussed below and in Overturning the Objections neither could establish the existence of the other. In the last sentence, this analysis is expanded as a model for all entities in a similar situation.
An Examination of Actors and Actions

In the Sutras of the Mother, the Buddha taught:

*No actor is perceptible and no action is perceptible, either.*

**IN THIS CHAPTER, Nagarjuna will prove the validity of this statement with logical reasoning.**

Nagarjuna composed this chapter in answer to those who thought that composite things truly exist because the actors and actions that produce them truly exist. In order to demonstrate to these people that their belief was flawed, Nagarjuna had to examine actors and actions and demonstrate that they do not truly exist after all.

The way to analyze actors and actions is to examine the possible ways they could exist in relation to each other. If they do exist, do they exist sequentially or simultaneously? They cannot exist sequentially, because, first, the actor cannot exist before the action. If the actor did exist before and therefore independent of the action, then there would be a performer of an action even when the action was not being performed. For example, if the action was to write a letter and the actor was the letter writer, then there would be a letter writer who did not perform any action of writing a letter. Furthermore, the action cannot exist before and independent of the actor, for if it did, it would be an action without an actor performing it, which would be impossible. Since the actor can exist only if there is an action, but the action can exist only if there is an actor, they exist only in mutual dependence, and therefore they have no nature of their own. They do not truly exist.

Then one might ask, “I can see why the actor can’t exist before the action and why the action can’t exist before the actor, but why can’t they exist at the same time?” The reason they cannot is that if they did, and each had its own inherent nature, there would not be any connection between them—they would be two independent things. To say that things exist inherently means that they do not exist in dependence upon each other. Here, though, the only reason we can say there is an actor is because there is some action, and the only reason we can say there is an action is because there is some actor. They have a relationship in which each is the cause of the other; they are dependent upon each other for their existence. This is why they cannot exist simultaneously as independent entities—if they did, they would not have that relationship of mutual dependence. Like a horse and a cow, each would be able to go its own way without any effect on the other at all.

We can put this in a form of a logical reasoning by saying: Neither an actor nor an action has any nature of its own, because for an actor to exist there must be an action, but that action can exist only in dependence upon the actor herself. Since they can exist only in mutual dependence, they do not truly exist.

Thus, actors and actions do not truly exist because they cannot exist independent of each other. They do, however, exist as dependently arisen mere appearances that manifest due to the coming together of causes and conditions. To explain this, Nagarjuna writes in verse twelve:

*An actor exists in dependence upon an action,*
*An action exists in dependence upon an actor,*
*And apart from that,*
*No reason for their existence can be seen.*

It is very good for us to know the root verses of this text, as opposed to merely receiving a general explanation of their meaning, because then we can be certain of what the text actually says. In fact the Sanskrit version of this text exists, as does the Tibetan translation, and now there are translations into English and other languages. If you like, you can compare these different versions in order to gain a better understanding of their meaning. To have at least one version to refer to helps us to have a good and stable understanding of what this text is about.

There are three ways of understanding actors and the karmic actions that they perform. When explanations are given to beginners about karma and the actors who perform karmic actions, these things are explained as if they really exist. We have to understand, though, that this is from the perspective of no analysis, the perspective of just taking appearances to be real, without analyzing them. The next step is to analyze with precise knowledge, and when we do that, then we see, as we have done here, that actors and actions are not real, that they do not really exist at all. The ultimate understanding is that the true nature of actors and actions is beyond any conceptual notion of them, whether it be a thought that they exist or that they do not exist. Their actual nature transcends both of those concepts, and this third stage presents the ultimate way to understand reality. It is important for us to distinguish these three stages of no analysis, slight analysis, and thorough analysis, because by doing so it becomes clear that there are no contradictions in the Buddha’s teachings. At the same time, our respect for the Buddha’s skill in presenting teachings of gradually increasing levels of subtlety and profundity will grow.

ROBINSON (Skt):
8. the act and the agent.
8/0 Question. Doing, the doer, and the deed which he performs, manifestly exist. Karmic recompense exists by virtue of the combination of these three elements, so there must be a doer and a deed.

Reply: In chapter after chapter above, we have negated all dharmas, with nothing remaining. The three marks, for example, have been negated, and since the three marks do not exist, there are no active dharmas. Since active (dharmas) do not exist there are no non-active ones, and since there are neither active nor non-active dharmas, there is no doing, and no doer of any dharma whatsoever. If these are active, then they have been negated already, being included in the active. If inactive, they have been negated already being included among the inactive. You should not question this again, yet being deeply immersed in mental attachments, you have raised more questions, to which we must now give more replies.

PINGALA COMMENTARY

CANDRAKĪRTI COMMENTARY

[Chapter IX]

Refutation of realism

You may object that the compound elements of existence (samskrta dharma) (fn 1 Topic of a chapter [MMK VII] not included in this translation.) - consciousness and the rest — do exist in fact, it being their nature to exist as compounded; this is because their cause, the agent subject and his doing (karma- karaka), exists in fact. As the illustrious one said, ‘A human person, o monks, who is in the grip of ignorance develops meritorious qualities or unmeritorious qualities of a special kind’, and so on. This passage speaks of the agent subject and

his doing and teaches that the consequences of his doing — consciousness and the other factors (fn 2 The allusion is to the Buddhist paradigm of causality, the cyclical linkage of causal factors in existence: ignorance, character disposition, consciousness, individuality, sense organs, etc., leading to re-birth.) — are compounded. That of which there is a productive agent must itself exist, as, for example, a pot. What does not exist can have no producer, as, for example, a garment made of tortoise hair.

We reply that there would be compounded factors like consciousness if the agent subject and his doing existed as their cause; but they do not. Because

KALUPAHANA COMMENTARY

Chapter Eight Examination of Action and the Agent
(Karma-karaka pariksa)

GARFIELD COMMENTARY

Chapter VIII Examination of the Agent and Action

The discussion of external phenomena comprised by the first seven chapters of the text leads naturally to a discussion of the subject side of experience, a discussion that occupies the next six chapters. For it might be granted that the phenomenal external world is empty, but argued that it depends for its nominal existence on an inherently existing subject. This idealist tactic, familiar in the West through Berkeley and Hume (and criticized by Kant in the refutation of idealism), was adopted by some (the Cittamatra school) in the history of Buddhist philosophy. We can well imagine an opponent at this stage in the dialectic conceding to Nāgārjuna that external phenomena lack inherent existence and that the dependent arising that characterizes them lacks inherent existence, but that their very emptiness entails their nominal character ‘and, hence, some subject capable of engaging in nominal imputation. So the subject as agent must exist.
INADA (Skt):
Verse 1 - A doer in a completed state cannot create a deed in a completed state. Again, a doer in an incompleted state cannot create a deed in an incompleted state.

JONES (Skt):
[1] A truly existing actor does not perform a truly existing action, nor does an actor who does not truly exist perform an action that does not truly exist.

KALUPAHANA (Skt):
This really existent agent does not perform a really existent action. Neither is it intended that a really non-existent agent performs a really non-existent action.

MCCAGNEY (Skt):
A true agent does not do this true act.
Nor does a true agent attempt a true act.

NISHIJIMA (Skt?):
1. The Real Existence, Conduct, and Action,
The Real Existence does never produce this World.
To produce something, is never to produce something abstract at all.
Action does sacrifice itself sometimes for getting some abstract fame.

SPRUNG (Skt):
1 An agent subject, actual as such, does not give rise to a product, actual as such. Nor does an agent subject not actual as such realize a product not actual as such.

STRENG (Skt):
1. A real producer does not produce a real product. Even more so, a non-real producer does not seek a non-real product.

ENGLISH TRANSLATIONS

BOCKING (Ch):

He does not do a fixed deed.
If there is no fixed, existent doer
He does not do a non-fixed deed.

BATCHelor (Tb):
One who exists as an actor does not do that which exists as an act. One who does not exist as an actor also does not do that which does not exist as an act.

DOCTOR (Tb):
That which is an agent does not Perform something that is an action.
A nonagent does not Perform a nonaction. [VIII.1]

GARFIELD (Tb):
1. This existent agent
Does not perform an existent action.
Nor does some nonexistent agent Perform some nonexistent action.

GARFIELD-SAMTEN (Tb):
1. That which is an agent
Does not perform an existent action.
Nor does that which is not an agent Perform some nonexistent action.

HAGEN (paraphrase):
8.1 A truly existent agent does not perform a truly existent action. Nor does a nonexistent agent perform a non-existent action.
PINGALA COMMENTARY

8/1 If there is a fixed, pre-existent doer, and a fixed, existent deed, then there should be no doing. If there is no fixed preexistent doer and no fixed deed, then also there should be no doing, and why?

CANDRAKĪRTI COMMENTARY

The verse says the agent subject ‘gives rise to’ or ‘produces’ (karoti), that is, he is the doer (karta). The term agent subject, or producer, is used only of someone who produces something, not of one who does not produce something. One must conceive of such an act of production as the act of an agent who is actual as such (sadbhuta) or who is not (asadbhuta) or who both is and is not. ‘What is produced’ — the product, what is done (karma) — is the primary object of the agent; it too may have three modes: actual, non-actual or both.

The two themes of this verse are, first, that an agent subject, actual as such — one conjoined with the activity (kriyayukta) of agency — does not give rise to a product which is actual as such, that is which is conjoined with the activity of being produced; and, second, that an agent not actual as such - one devoid of the activity (kriyarahita) of agency does not give rise to a product which is not actual as such, that is which is devoid of the activity of being produced.

With a view to establishing the first thesis Nagarjuna says

KALUPAHANA COMMENTARY

The examination of the "dispositionally conditioned" (samskrta) naturally led Nagarjuna to another major philosophical problem that has been the subject of much misunderstanding among the Buddhists as well as the non-Buddhists, namely, the doctrine of karma.

In the early discourses, karma and samskara (and, therefore, samskra) are mutually related. While karmas are said to form samskaras (see M 2.121), samskaras themselves are determinants of karma. The Buddha who denied an eternal soul or self (atman) was often confronted by skeptics who raised the question as to how karmas performed by a "no-self" can affect a person (anattakatani kammani kam (katam) attanam phusissanti, M 3.119; S 3.103). This is not, however, the problem of moral responsibility (karma-phala), which Nagarjuna takes up later in Chapter XVII. The present problem relates mostly to the nature of an action and an agent (karma-karaka). When this latter question was raised in the discourses, very often it is said that there is no substantial agent who is the author of actions. What is generally understood as a substantial being (satta) or person (puggala) is nothing more than a "lump of dispositions" (sankhara-punja, S 1.134), which is another name for the five aggregates (khandha), each receiving its form conditioned by the sankharas (S 3.87; Tsa 2.14 [Taisho 2.11C]). Neither the "lump of dispositions" nor the aggregates were considered to be substantial, that is, having a reality of their own. The "dispositions" (sankhara), which are acquired by the person and, therefore, impermanent, are also responsible for conditioning that personality. Thus, according to early Buddhism, neither the person nor the aggregates (one of which is disposition, sankhara) have any substantial reality. In the first place, the dispositions themselves are impermanent (vayadhamma sankhara, D 2.156) and, secondly, all phenomena, including all persons or aggregates, are non-substantial (sabbe dhamma anatta, M 2.228; S 3.133; A 1.286; [Taisho 2.668])

Yet, when the canonical Abhidharma texts rejected a real self or soul (atta) and listed the various physical and psychological factors that go to constitute the human personality, the interpreters of these physical and psychological factors transgressed the limits of speculation and admitted the real existence of these various factors. Thus came to be the theory of the substantiality of elements propounded by the Sarvastivadins. Therefore, in his attempt to establish the non-substantiality of all elements (dharma-nairatmya), Nagarjuna was compelled to examine the concepts of action (karma) as well as the agent of such action (karaka) in the present section of his treatise (leaving the question regarding moral responsibility for a detailed discussion at a later and more appropriate time). As explained previously, Nagarjuna realized that the concepts of substantial existence (sat, astitva) as well as absolute non-existence (asat, nastitva) were two extremes to be avoided in any discussion of action and agent.

GARFIELD COMMENTARY

1. Nāgārjuna here announces that, with respect to agency and action as well, he will steer a middle course between inherent existence and complete nonexistence. Neither action nor agent will come out to be an inherently existing entity. Nor will either end up being completely nonexistent.

Verse 2 - When a doer is in a completed state, there will be no doing and also a deed will be without a doer. Likewise, when a deed is in a completed state, there will be no doing and also a doer will be without a deed. - Note: The concept of a function or doing is introduced here to set up a triadic relationship, i.e., with respect to doer (karaka, kartr), doing (kriya), and the deed (karma).

JONES (Skt):
[2] A truly existing entity has no activity; there would also be action without an actor, and an actor would exist without an action.

KALUPAHANA (Skt):
A really existent entity has no activity. Therefore, action would be without an agent. A really existent entity has no activity. Therefore, even an agent would be without action.

MCCAGNEY (Skt):
There is no activity of a true action and so it would be without an agent. There is no activity of a true agent and so it would be without action.

NISHIJIMA (Skt?):
2. In the Real Existence, Practical Action does never really exist at all.
And Action itself might be different from a person, who actually does the Action directly.
In the Real Existence, Practical Action does never really exist at all.
A person, who acts some thing to accomplish his aim, has possibility that he sometimes does not have any special clear aim at all.

SPRUNG (Skt):
2 If there is no activity of an agent subject who is actual as such, a product would be without a producer. If there is no activity of an agent subject actual as such the agent would be without a product.

STRENG (Skt):
2. There is no producing action of a real thing; if so, there would be a product without someone producing. Also, there is no producing by a real thing; if so, there would be someone producing without something produced.

BOCKING (Ch):
8v2 A fixed deed has no doing. And such a deed has no doer. A fixed doer has no doing. And a doer also has no deed.

BATCHelor (Tb):
One who exists has no activity; [something] would also exist as an act without an actor. One who exists has no activity; [something] would also exist as an actor without an act.

DOCTOR (Tb):
That which is an agent would have no activity. There would also be action without an agent. That which is an action is not performed, So the agent would be lacking its action. [VIII.2]

GARFIELD (Tb):
2. An existent entity has no activity. An existent entity has no activity. There would also be agent without action.

GARFIELD-SAMTEN (Tb):
2. That which is an agent has no activity. That which is an agent has no activity. There would also be agent without action.

HAGEN (paraphrase):
8.2 A truly existent entity has no activity. Thus, action would be without an agent, and an agent would be without action.
PINGALA COMMENTARY

8/2 If there is a fixed, pre-existent deed, then there should not be any additional doer. Even so (you might argue) there should be a deed apart from the doer – but this is not so. If there is a fixed, pre-existent doer, then there should not be any additional deed. (Perhaps) even so there should be a doer apart from the deed? – but this is not so. Therefore, if you have a fixed doer or a fixed deed there cannot be doing, and if you have a non-fixed doer and a non-fixed deed then there cannot be doing either, and why? Because from the beginning they never existed. Even an existent doer and existent deed cannot do. How much less a non-existent doer and non-existent deed!

Further.

CANDRAKĪRTI COMMENTARY

2ab If there is no activity of an agent subject who is actual as such, a product would be without a producer.

Because what is called an agent subject is essentially conjoined with the activity of agency, only an agent who exists as such conjoined with the activity of agency gives rise to something and receives the name agent or producer. It follows that for one such, who is called agent or producer because of his activity of production, there cannot be another activity by which he gives rise to a product. If, because of the absence of this second activity the agent does not give rise to anything, then a product would be unrelated to an agent, that is, would be without a producer (akartrka).

But a product is not possible without a producer, it would be like the making of a pot by the son of a barren woman. This being so, if there is no activity of an agent subject who is actual as such, a product would be without a producer. Because of this unacceptable consequence an agent subject actual as such does not give rise to any product (fn 3 A producer is such only when he is producing; i.e. he must be a producer before he enters into the activity of producing a product. Yet a producer can produce nothing but a product. Therefore he cannot be a producer before he produces a product).

And now, explaining that an agent does not give rise to a product actual as such, Nagarjuna says

2cd If there is no activity of an agent subject actual as such the agent would be without a product.

KALUPAHANA COMMENTARY

This is an extremely interesting analysis of the implications as well as the consequences of admitting a really existing entity (sadbhuta), a soul or a self (atman, pudgala) or even a substance (svabhava). The concept of a self (atman) as envisaged in the substantialist traditions, like the Upanisads, is one of pure entity, permanent and eternal, unaffected by the changes taking place in the phenomenal world. It is beyond all forms of duality and multiplicity. The concept of substance, even though rarely defined as a "pure entity," yet partakes of all other characteristics, namely, permanence, eternity, non-duality, and non-multiplicity. This means that any activity, any change in quality, in quantity, in character, or in form would be merely superficial. The real or the essential is eternal. Such implications of the Sarvastivada theory of substance (svabhava) were noted earlier (see Chapter I). If
the cause and effect were to be identical in essence, then their difference becomes superficial. A cause becomes unproductive and would be like a tree stump that remains motionless (vanjha kutattha, D 1.14, 56; S 3.211; M 1.517; avicalita-nityatva, see Kalupahana, Causality, p. 28).

Hence Nagarjuna's statement: "A really existing entity is without activity." This assertion leads to two rather disastrous consequences, especially for the doctrine of karma; either an action (karma) will be rendered agentless (a-kartrka) or an agent (kartr) would be action-less (a-karmaka).

**GARFIELD COMMENTARY**

2. If the agent were inherently existent, then it would be unchanging. Activity is always a kind of change. So if there were action in the context of an inherently existing agent, the action would be agentless, which would be absurd. Moreover, the agent would be inactive, which would also be absurd. This, of course, is just one more case of Nāgārjuna demonstrating the incoherence of a position that tries both to posit inherently existent, independent entities and then to get them to interact.

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 3 - If a doer in an incompleted state creates a deed in an in-completed state, then (in actuality) the deed will be without a cause and the doer will (in itself) have no cause.

JONES (Skt):
[3] If an actor who does not truly exist performs an action that does not truly exist, then the action would be without a cause, and the actor too would be without a cause.

KALUPAHANA (Skt):
If a non-existent agent were to perform a non-existent action, the action would be without a cause, and the agent too would be without a cause.

MCCAGNEY (Skt):
If an untrue agent does an untrue act, the act would be without a cause and the agent would be without a cause.

NISHIJIMA (Skt?):
3. When something abstract is produced.
The something abstract, which are products, are Action and Practice.
Something unreasonable can exist as Action, And a person, who acts, can also exist as someone unreasonable actually.

SPRUNG (Skt):
3 If an agent not actual as such gives rise to a product not actual as such then such a product would be uncaused and the agent would be non-causal.

STRENG (Skt):
3. If a non-existent producer would produce a non-real product, The product would be without a causal source and the producer would be without a causal source.
PINGALA COMMENTARY

8/3 If there were a fixed, pre-existent doer and fixed existent deed, and you say that there is a doer who does, then this constitutes causelessness. If there is a doer apart from the deed done, or a deed apart from its doer, then they exist without arising from causal conditions.

Question: What is wrong in saying that both doer and deed exist, without arising from causal conditions? Reply:

CANDRAKĪRTI COMMENTARY

An agent not actual as such is one devoid of the activity of agency. As the activity of agency is the basis (hetu) for the expression agent, an agent not actually producing would be non-causal (nirhetuka); and as well a product not actual as such would be uncaused (nirhetuka). If we accept the doctrine that things can exist without a causal basis (hetu) (fn 5 Either material cause or causal principle in general. This is an attack on the view, held by some Buddhists, that dharmas, the elements of existence, subsist, when not actualized in time, without a material basis and causally inactive.) then, Nagarjuna says, effect and cause and all related concepts would be denied validity.

KALUPAHANA COMMENTARY

If one were to accept the view which is contrary to the one mentioned at VIII. 2, that is, a non-existent entity performing a non-existent action, then both agent (kartr) and action (karma) would be rendered cause-less (ahetuka). VIII.2-3 thus turn out to be a clear warning against the universal and indiscriminate application of the examples of "illusion" (maya), "dream" (svapna) and the "city of the gandharvas" (gandharva-nagara), especially in the matter of explaining "emptiness" (sunyata) at VII. 34 and elsewhere.

GARFIELD COMMENTARY

3. However, if agent and action are totally nonexistent, there will be no cause for the action and no justification for calling the agent an agent.
Kārikā VIII.4

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 4 - Without a cause, there can be no effect or an efficient cause. Without these (effect and cause), there can be no functions of doing, doer and deed. - Note: Hetu which is simply cause must be distinguished for karana which is an instrumental or efficient cause, i.e., having a potential. The karana in the second line is used synonymously for karma.

JONES (Skt):
[4] If there is no cause, then an effect and its cause are not found. Without these, activity, an actor, and a means of action are not found.

KALUPAHANA (Skt):
When a cause does not exist, both the effect and the sufficient condition are not evident. When these are non-existent, activity, agent and performance of action are also not evident.

MCCAGNEY (Skt):
Where the cause does not exist, neither the antecedent cause nor the act to be done occur. Where these do not exist, the activity, the agent, and the act to be done do not occur.

NISHIJIMA (Skt?):
4. There is no special stimulus, and at the same time there is no recognition to be successful, there might be no possibility to succeed, And the factor of success can not be recognized at all. Non existence of the Real Practice and non existence of a person, who practice it by himself, The factor of success can not be recognized at all.

SPRUNG (Skt):
4 In the absence of the causal principle there will be no cause and no effect. In their absence there will be no activity, no agent and no means.

STRENG (Skt):
4. If there is no causal source, there is nothing to be produced nor cause-in-general (karana). Then neither do the producing action, the person producing, nor the instrument of production (karana) exist.

BOCKING (Ch)
8v4 If you fall into causelessness
Then there is no cause and no effect.
No doing and no doer
And no dharma of deed involved.

BATCHelor (Tb):
If there were no cause, effect and cause would not be evident. If they were non-existent, activity and agent and doing would not be evident.

DOCTOR (Tb):
If there is no cause,
Cause and effect become untenable.
Without these, action, agent, and activity Will all be nonsensical as well. [VIII.4]

GARFIELD (Tb):
4. Without a cause, the effect and Its cause will not occur. Without this, activity and Agent and action are not possible.

GARFIELD-SAMTEN (Tb):
4. Without a cause, the effect and The cause would not be possible. Without this, action, Agent and instrument would not be possible.

HAGEN (paraphrase):
8.4 When there is no cause, there is no effect. Without cause or effect, neither action, agent, nor activity appear.
4ab *In the absence of the causal principle there will be no cause and no effect.*

If we accept the causal principle in general (*hetu*), what is produced in virtue of causality is the effect. What gives rise to the effect may appropriately be called direct cause (*karana*). For example, clay is the material cause (*hetu*) of a pot and the pot is the effect. The potter’s wheel and so on are the cooperating direct causes. If, however, we assume that there is no causal principle there could be no pot because it would be unrelated to a material basis, like a pot made from the crest-jewel taken from the head of a frog. If there is no pot how could there be a cause of it? So, as Nagarjuna put it, ‘In the absence of the causal principle there will be no cause and no effect.’ Therefore

4cd *In their absence there will be no activity, no agent and no means.*

‘In their absence’ means in the absence of cause and effect. What effect would make the activity of an agent conceivable? In which activity would there be an independent agency of the potter? Nor does it make sense that the effective means should be merely the pot having the same nature as the clay. So much for in their absence there will be no activity, no agent and no means.’ Therefore

**KALUPAHANA COMMENTARY**

Further implications of the denial of a cause at VIII. 3 are highlighted here. Not only would it negate an effect (*karya*) or a sufficient condition (*karana*), it would also lead to the abandoning of activity, agent as well as action, none of which is acceptable to Nagarjuna.

**GARFIELD COMMENTARY**

4. Agent, the agent’s activity, and the action all depend upon conditions. They are all, therefore, dependently arisen and empty. If, as the opponent would have it, these are inherently existent, there would be no action. But if we think of them as dependent, we can make perfectly good sense of agent, activity and action in interrelation.
Kārikā VIII.5

INADA (Skt):
Verse 5 - Without these functions, etc. [doer, deed], there can be no factors (dharma) and non-factors (adharma) of experience. Without factors and non-factors there can be nothing arising out of them.

JONES (Skt):
[5] Without activity, an actor, and a means of action, there are no correct or incorrect actions. And if there are no correct or incorrect actions, effects cannot arise from them.

KALUPAHANA (Skt):
With the non-occurrence of activity, etc., good and bad are also not evident. When both good and bad do not exist, a fruit arising from these would also not be evident.

MCCAGNEY (Skt):
Neither [action] in accord with the teaching nor [action] not in accord with the teaching occurs in the existence of activity, etc.
The effect does not exist in [action] in accord with the teaching nor in [action] not in accord with the teaching, so it does not occur.

NISHIJIMA (Skt?):
5. The coexistence of the Universe and the non-Universe are never recognized,
And relating with their Real Practice and so forth, their real situations, and so forth, are not so clear.
Even inside the Universe there is no fact of existence, and even in the outside of the Universe there is no fact of existence at all.
Therefore what are called Results, and what has been born from Results, are not recognized as real existences at all.

SPRUNG (Skt):
5 If activity, agent and means are impossible there would be no right and no wrong. If there is neither good nor ill deed no fruit can arise from them.

STRENG (Skt):
5. If the producing action, etc. do not exist, then neither can the true reality (dharma) nor false reality (adharma) exist. If neither the true reality nor the false reality exists, then also the product (phala) born from that does not exist.
5ab If activity, agent and means are impossible there would be no right and no wrong.

The thought here is that if Devadatta is an actual agent because, of his own free will, he engages in the activity of refraining from taking life, he gives rise to the activity of refraining from taking life because of a freely chosen purpose and through the appropriate means. In this way a meritorious deed has arisen for him. This can be applied to the remainder of the ten favourable paths of action which are produced by favourable activities and also to the favourable observances laid down such as honouring the triple jewel (in 6 The Buddha, the (Buddhist) Truth and the community of Buddhist monks), one’s mother and father, other worthy people and so on. And in the case of wrongdoing as well, that is the taking of life and so on, the opposite of the favourable paths, it should be emphasized that the consequence will necessarily follow that, if there are no activities, no agents and no means, there are no deeds. If, in this sense, there is no good deed and no ill deed then they can obviously have no moral consequences.

Nagarjuna expounds this saying

5cd If there is neither good nor ill deed no fruit can arise from them.

If neither good nor ill deed (dharmadharma) exists there could be no fruit, no moral consequences (phala), whether desirable or undesirable, born of good and ill deeds. Hence

**KALUPAHANA COMMENTARY**

Inada’s rendering of this verse clearly indicates his faithful adherence to the transcendentalist interpretation of Nagarjuna offered by previous interpreters like Stcherbatsky, Murti, Conze, and most of the Japanese scholars. In spite of Kumarajiva’s very clear rendering into Chinese, Inada translates dharma and adharma as factors and non-factors respectively (). While it is true that the term dharma is used in the Buddhist texts, both in an ontological sense (referring to “phenomena”) and in a more ethical sense (meaning “good”), there is no evidence at all that the negative term a-dharma was ever used in the former sense. A careful examination of the contexts in which it occurs provides sufficient evidence that the term meant “bad” and, hence synonymous with akusala. Furthermore, of all the terms used to refer to an effect, the term phala occurring in this verse is invariably used in the sense of “fruit,” having a moral connotation.

The present verse, therefore, provides unmistakable evidence that Nagarjuna was upholding the moral philosophy advocated by the Buddha in his first discourse—the Dhammacappavattana-sutta—which lays down a middle path between the two extremes, which in its turn is based upon the philosophical middle position presented in the "Discourse to Katyayana ."

The belief in substantial existence or eternalism (atthita , sassata) leads to self-denial (attakilamathanuyoga) and the idea of nihilistic non-existence or annihilationism (n'atthita ,uccheda) contributes to self-indulgence (kamasukhallikanuyoga) (see Introduction). Verses VIII. 3-4 refer to the substantialist and annihilationist views of karma, both of which lead to the abandoning of a moral life (including moral responsibility) as understood by the Buddha. Having spoken of artha (effect, fruit, consequence) in relation to pratyaya (cause, condition) in Chapter I, Nagarjuna is here addressing himself to the question regarding the "fruit of action" (karma-phala), a detailed treatment of this problem being reserved for a later occasion (Chapter XVII). In the present chapter, Nagarjuna’s intention is to explain the non-substantiality of the "agent" and the "action," rather than settle the question of moral responsibility. However, he could not help referring to the "fruits of action," primarily because the metaphysical notions of "agent" and "action" contributed to their very denial.

**GARFIELD COMMENTARY**

5. If there were no action, then since entities arise from the action of previous events, there would be no entities and no effects. In short, without making sense of the possibility of actions and agency as empty, we can’t account for the existence of any phenomena.
ENGLISH TRANSLATIONS

INADA (Skt):
Verse 6 - When there is no effect there will be no way of arriving at liberation or the heavens. For all doings or functions will fall into purposelessness.

JONES (Skt):
[6] If there is no effect, neither the way to release from the cycling of rebirth or to the heavens exists. From this follows the futility of all activity.

KALUPAHANA (Skt):
When the fruit does not exist, the path of release or of heaven is not appropriate. This would imply the futility of all activity.

MCCAGNEY (Skt):
Where the effect does not exist, the path goes not to heaven and not to liberation, and the purposelessness of all activities follows.

NISHIJIMA (Skt?):
6. Not being grasped by result does not mean being in freedom. And the situation called "as if it were living in the Paradise", does not appear at all. Morals are all belonged to what have been done actually, And so all actions, which have been done as morals, are never attached by Praja-pati at all.

SPRUNG (Skt):
6 In the absence of moral consequences such as fruition a path leading to heaven or to liberation is unintelligible. It follows that all activities whatsoever are without purpose.

STRENG (Skt):
6. If there is no real product, then there also exists no path to heaven nor to ultimate release. Thus it logically follows that all producing actions are without purpose.

BOCKING (Ch):
8v6 Where there is no recompense for sin or merit, There is also no nirvana. And whatever one may do Is completely vacuous and without effect.

BATCHelor (Tb):
If there were no fruit, the path of liberation and higher states would not be appropriate. Also it would follow that all activities are meaningless.

DOCTOR (Tb):
Without such effects, paths to liberation And to the higher realms do not make sense. All activities would indeed End up entirely meaningless. [VIII.6]

GARFIELD (Tb):
6. If there are no effects, liberation and Paths to higher realms will not exist. So all of activity Would be without purpose.

GARFIELD-SAMTEN (Tb):
6. If there were no effects, liberation and Paths to higher realms would not be possible. The absurd consequence would follow That all action would be pointless.

HAGEN (paraphrase):
8.6 If there are no fruits then neither the path nor liberation are intelligible. Thus all intentional activity would be futile.

ruò wú zuì fú yì wú yǒu niè pán zhū kě yǒu suǒ zuǒ jiē kōng wú yǒu guǒ
| 'bras bu med na thar pa dañ | | mtho ris 'gyur pa'i lam mi 'thad | | bya ba dag ni thams cad kyaṅ | | don med ņid du thal bar 'gyur |
PINGALA COMMENTARY

8/6 If you fall into causelessness, all dharmas become causeless and effect-less. A dharma which is able to produce is called a 'cause', and the dharma which is produced is called an effect. If these two are non-existent, then because these two do not exist there will be no doing and no doer, and no dharma of deed involved. Also there will be no sin or merit, and because there is no sin or merit there will be no recompense or retribution for sin and merit and thus no path to nirvana. Therefore, there cannot be causeless production.

(12c14) Question: What is wrong in saying that the doer is not fixed, and that he does a non-fixed deed?

Reply. Even if one element is missing, it is impossible to begin a deed. How much more so when both are lacking! It is like an apparition which has its abode in apparent space, existing merely as a designation without any doer or deed.

Question. If there is no doer and no deed, there cannot be anything done; but if there is a doer and there is a deed, there should be doing. Reply:

CANDRAKĪRTI COMMENTARY

6ab *In the absence of moral consequences such as fruition a path leading to heaven or to liberation is unintelligible.*

If there were desirable or undesirable consequences on the lower path (*laukika marga*) which aims at composed insight beyond phenomena through meditation, that is to say, heaven, then the spiritual pursuit of the lower path would be the best means of achieving this and it would include the fruits of renouncing the kinds of action which conduce to a wasted life. And if *nirvāṇa*, understood as liberation, were a fruit of action then with it in view the spiritual pursuit of the higher path (*lokottara marga*), the eightfold path of the wise, would bear fruit. But as there are no fruits of action, in the absence of moral consequences as fruition, a path leading to heaven or to liberation is unintelligible.'

If in this way there is no fruit, what then?

6cd *It follows that all activities whatsoever are without purpose.*

Further, such activities as farming, commerce and governing are taken up with a view to their fruits; all such activities as well, if there are no fruits, will be unintelligible. In this sense it would follow that all activities as such are without purpose. But they are not without purpose. That is why this theory is the source of the poisonous growth of all the fallacies. It denies both heaven and liberation, it is the source from which hell arises and the great troubles which descend on us, it contradicts both the seen and the unseen reasons for things. This being so the thesis that an agent subject who is not actual gives rise to deeds which are not actual is a debased theory and is to be rejected by the wise (in 7 This sweeping rejection of the non-actual agent because of causal inefficacy, reminds of Aristotle’s rejection of the separate, i.e. ‘non-actual’ existence of Plato’s forms. Madhyamika cannot tolerate the claim to existence of anything other than the actual; and, of course, even that claim is merely commonsensical.)

Exhaustion of the formal possibilities

Having in this way established the two theses Nagarjuna now says that an agent subject by nature both actual and non-actual does not give rise to a product which is by nature both actual and non-actual.

KALUPAHANA COMMENTARY

Not only is Nagarjuna interested in the "ultimate fruit" (paramartha), i.e., freedom from suffering (mokṣa), he is also concerned with the fruits (artha, phala) that actions can generate as human beings proceed along the moral path (marga) gradually leading to that "ultimate fruit." Hence his interest in "heaven" (svarga), so often discussed in the "discourses" as the "fruits" enjoyed by the "wayfarer." As far as Nagarjuna is concerned, human actions are rendered "fruitless" or "meaningless" (nir-artha), if one were to adhere to either a theory of eternalism or of annihilationism.
6. And all of this has a moral and a soteriological dimension as well. For if there are no acts and no effects, then the practice of morality and of the Buddhist path will make no sense. There would be no point to life if human action is impossible. And again, its impossibility follows straightforwardly from the reification of either agent or action. It is ironic that it is the urge to guarantee more reality and significance for ourselves than emptiness appears to allow that leads to a view of life as perfectly impossible and pointless. That is, though we are led to ascribe inherent, independent existence to ourselves and to the world of phenomena we cherish - in part, in order to assign them the greatest possible importance - this very importance would be completely undermined by such inherent existence and independence. For in that case, all activity and all consequences of activity would be impossible. The resultant life would be static, detached, and utterly meaningless. Only in the context of emptiness - what might appear to be the greatest threat to meaningfulness - can a meaningful life be understood.
INADA (Skt): Verse 7 - A completed-incompleted doer cannot create a completed-incompleted deed. For, how could the mutually conflicting completed and incompleted states co-exist as one?

JONES (Skt): [7] An actor who is both truly real and not truly real does not perform an action that is both truly and not truly real, for "real" and "unreal" are opposed to each other - how could they exist together simultaneously?

KALUPAHANA (Skt): An agent who is both existent and nonexistent does not perform an action that is both existent and nonexistent, for they are self-contradictory. Where can existence and non-existence co-exist?

MCCAGNEY (Skt): A true or untrue agent does not do what is true or untrue, because existence and nonexistence are indeed mutually contradictory.

NISHIJIMA (Skt?): 7. Doing something is coexistence of the real and the unreal. But something real and something unreal do not create anything concrete.

Because something real and something unreal are contrasting against each other, The Real and the Unreal do never be identified at any place at all.

SPRUNG (Skt): 7 An agent subject both actual and non-actual does not give rise to a product both actual and non-actual. As to exist and not to exist are reciprocally contradictory1 how can they hold of one and the same thing?

STRENG (Skt): 7. And a real-non-real producer does not produce in a real-non-real manner. For, indeed, how can "real" and "non-real," which are mutually contradictory, occur in one place?

TOBEH (Skt): 7. Doing something is coexistence of the real and the unreal. But something real and something unreal do not create anything concrete.

Because something real and something unreal are contrasting against each other, The Real and the Unreal do never be identified at any place at all.

BOCKING (Ch): 8v7 A doer, whether fixed or not fixed, Cannot do two kinds of deeds.
For, since existence and non-existence are mutually opposed, The two cannot exist together.

BATCHelor (Tb): One who exists and does not exist as an actor does not do what exists and does not exist [as an act]. Since existence and non-existence are mutually contradictory in one [thing], where can they exist?

DOCTOR (Tb): That which both is and is not an agent Does not perform something that both is and is not. Since being and not being are incompatible in one thing, How could this ever be the case? [VIII.7]

GARFIELD (Tb): 7. An existent and nonexistent agent Does not perform an existent and nonexistent action. Existence and nonexistence cannot pertain to the same thing. For how could they exist together?

GARFIELD-SAMTEN (Tb): 7. That which is and is not an agent Does not perform that which is and is not an action. The same thing cannot both be and not be so. Since they are contradictory, how could it be like that?

HAGEN (paraphrase): 8.7 An existent non-existent agent does not perform an existent non-existent action for such would be contradictory. Where could existence and nonexistence occur together?
PINGALA COMMENTARY

8/7 A doer, whether fixed or unfixed, cannot perform either fixed or unfixed deeds, and why? Because existence and nonexistence are mutually opposed, and the two cannot exist in one place. Existence is fixed, non-existence is non-fixed, but one person is one entity, so how can he be both existent and nonexistent?

Further.

CANDRAKĪRTI COMMENTARY

7ab An agent subject both actual and non-actual does not give rise to a product both actual and non-actual.

Here a product both actual and non-actual means a product which is both conjoined with and not conjoined with the activity of being produced. An agent subject who is both actual and non-actual does not give rise to such a product. Because

7cd As to exist and not to exist are reciprocally contradictory (fn 8 Parasparaviruddha. One of the many passages explicitly stating the law of non-contradiction.) how can they hold of one and the same thing?

That one and the same thing at one and the same time can be both conjoined with the activity of being produced and not so conjoined is clearly nonsensical. Therefore an agent subject actually both existing and not existing does not give rise to a product actually both existing and not existing either. The thought is that they are not real (avidyamana).

Having exposed in this way the faultiness of the homogeneous form (fn 9 That is, where agent and deed are both either actual or non-actual or both. In the heterogeneous form the agent will be existent while his deed will be non-existent, and so on.) of the three theses, Nagarjuna, wishing to repudiate the heterogeneous form of the three theses as well says

KALUPAHANA COMMENTARY

After criticizing the substantialist as well as the annihilationist views relating to agent and action, Nagarjuna examines the theory that attempts to combine them. This follows the criticism at I.13. For Nagarjuna, contradictory predicates such as existence (sat) and non-existence (asat) cannot be applied to the same thing.

GARFIELD COMMENTARY

7. There is no way to escape from this dilemma by trying to have it both ways: The agent cannot be existent as an actor, but nonexistent as one who undergoes the action. Nor can the action be existent as an entity, but nonexistent as dependent upon the agent.

___
Kārikā VIII.8

satā ca kriyate nāsan nāsatā kriyate ca sat |
kartrā sarve prasajyante doṣās tatra ta eva hi ||8||

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 8 - A completed doer cannot create an incompleted deed nor can an incompleted doer create a completed deed. For, (if the above conditions are not accepted), thereupon all fallacies will follow.

JONES (Skt):
[8] And an actor who is truly real does not perform an act that is not truly real, nor can a truly real act be performed by an actor who is not truly real - if that were the case, all the errors relating to action and the one who acts would follow.

KALUPAHANA (Skt):
A non-existent action is not performed by a presently existing agent. Not is an existent action performed by a presently non-existent agent. Indeed, if that were to be the ease, all errors relating to the agents [mentioned earlier] would follow.

MCCAGNEY (Skt):
An existent [act] is not done by a nonexistent agent and a nonexistent [act] is not done by an existent agent. Indeed, in that case, all these errors follow.

NISHIJIMA (Skt?):
8. Relying upon the Reality, the Unreality is never created, And relying upon the Unreality, the Reality is never produced. Everything can be intended for a while, Because even bad conducts at the place are also the same as concrete facts there.

SPRUNG (Skt):
8 A non-actual product is not produced by an actual agent subject, nor is an actual product produced by a non-actual agent subject. All the previous fallacies will necessarily follow.

STRENG (Skt):
8. A real producer (kartra) does not produce what is non-real, and a non-real producer does not produce what is real. From that indeed, all the mistakes must logically follow.

BOCKING (Ch):
8v8 An existent cannot do the non-existent. A non-existent cannot do the existent. As to there being both a doing and a doer That error is as previously explained.

BATCHelor (Tb):
One who exists as an actor does not do an act which is not existent. One who does not exist [as an actor] also does not do what exists [as an act]. Here too faults will follow for one.

DOCTOR (Tb):
One that is an agent does not perform Something that is not an action, Nor does one that is not perform something that is Because the same flaws would ensue. [VIII.8]

GARFIELD (Tb):
8. An actual agent Does not perform a nonactual action. Nor by a nonactual one is an actual one performed. From this, all of those errors would follow.

GARFIELD-SAMTEN (Tb):
8. That which is an agent Does not perform that which is not an action. Nor does that which is not perform that which is. From this all of those errors would follow.

HAGEN (paraphrase):
8.8 A truly existent agent does not perform a non-existent action. Nor does a non-existent agent perform an existent action. If this were the case, then all the errors mentioned above would follow.
PINGALA COMMENTARY

8/8 If the doer exists but the deed does not, how can there be anything which is done? If the doer is non-existent and the deed is existent, how again, can there be anything done? Why is this? As previously explained in regard to existence, if the deed pre-existed, what more would there be for the doer to do? If the deed was not pre-existent, how could he accomplish the deed? In this way one would negate sin and merit, causality, recompense and retribution. Therefore he says in the verse; 'An existent cannot do the non-existent, A non-existent cannot do the existent. As to there existing both a doing and a doer, That error is as previously explained.'

Further.

CANDRAKĪRTI COMMENTARY

8ab A non-actual product is not produced by an actual agent subject, nor is an actual product produced by a non-actual agent subject.

A non-actual product, not actual as product, that is not conjoined with the activity of being produced, is not produced by an actual agent, one existing as agent, that is one engaged in the activity of producing. Because

8cd All the previous fallacies will necessarily follow.

‘If there is no activity of producing in an actual agent the product would be without agent.’ In this sense an actual agent does not produce a product. But neither is a non-actual product produced by one such. A non-actual product would be an uncaused (ahetuka) product. That is why ‘In the absence of the causal principle there can be no cause and no effect.’ From this all fallacies ensue.

And so, as the grounds are exactly the same as given before, the reason for the faultiness of the heterogeneous form of the thesis will not be adduced again. Even as it has been shown how an actual agent subject cannot give rise to an actual product, it should be shown, by following the method given, how a non-actual agent subject, that is one not connected with the activity of production, does not give rise to an actual product. Having thus far pointed out the fault in the heterogeneous form of the thesis by relating the terms singly, Nagarjuna now points out the fault in each term by relating them in pairs.

KALUPAHANA COMMENTARY

Existence (sat) and non-existence (asat) applied to the agent and action will produce some other alternative theories than those mentioned earlier, e.g.: i. A presently existent agent (santa) performs a non-existent (asat) action, and ii. a presently non-existent agent (santa) performs an existent (sat) action. Here, the agent is described by means of a present participle (santa).

GARFIELD COMMENTARY

8. Nor is it coherent to suppose that the agent is existent, but the action nonexistent. For then there would be no reason to call the agent an agent. An agent, after all, is someone who performs an action. The next two verses put this point and those made in the opening verses together:
Verses 2 and 3).

JONES (Skt):
[9] And for the reasons already given, an actor who is truly real cannot perform an action that is truly real or that is both truly real and not truly real.

KALUPAHANA (Skt):
For reasons stated above, an agent who has come to be existent does not perform an action that is nonexistent or both existent and non-existent.

MCCAGNEY (Skt):
No true agent does an untrue or both true and untrue act for the reasons above.

NISHIJIMA (Skt?):
9. It is not the unreal world, or it is not the real world.
It is just the world, which is fusion of the unreal world and the real world.
Doing something is Action,
And before talking, we are also relying upon reasons.

SPRUNG (Skt):
9 An actual agent subject, for the reasons already given, gives rise neither to a non-actual product nor to one both actual and non-actual.

STRENG (Skt):
9. The producer, who is neither real nor non-real, does not produce a product which is either real or non-real, Because of the reasons which have been advanced earlier.

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 9 - A completed doer cannot create an incompleted deed nor that of a completed-incompleted deed. This is according to the reason expounded in previous verses (i.e., verses 2 and 3).

JONES (Skt):
[9] And for the reasons already given, an actor who is truly real cannot perform an action that is truly real or that is both truly real and not truly real.

KALUPAHANA (Skt):
For reasons stated above, an agent who has come to be existent does not perform an action that is nonexistent or both existent and non-existent.

MCCAGNEY (Skt):
No true agent does an untrue or both true and untrue act for the reasons above.

NISHIJIMA (Skt?):
9. It is not the unreal world, or it is not the real world.
It is just the world, which is fusion of the unreal world and the real world.
Doing something is Action,
And before talking, we are also relying upon reasons.

SPRUNG (Skt):
9 An actual agent subject, for the reasons already given, gives rise neither to a non-actual product nor to one both actual and non-actual.

STRENG (Skt):
9. The producer, who is neither real nor non-real, does not produce a product which is either real or non-real, Because of the reasons which have been advanced earlier.

BOCKING (Ch):
8v9 A doer does not do a fixed deed
Neither does he do a non-fixed deed.
Nor a fixed-and-non-fixed deed.
Those errors have already been explained.

BATCHELOR (Tb):
One who exists as an actor does not do what does not exist as an act and what neither exists or not [as an act], because of what was demonstrated by the proof above.

DOCTOR (Tb):
The agent involved does not Perform any nonaction,
Or something that both is and is not an action.
The arguments have already been given. [VIII.9]

GARFIELD (Tb):
9. An existent agent Does not perform an action that Is unreal or both real and unreal As we have already agreed.

GARFIELD-SAMTEN (Tb):
9. That which is an agent with activity Does not perform that which is not9 Or that which is and is not an action.
We have already presented the arguments.

HAGEN (paraphrase):
8.9 Thus an existent agent performs neither a non-existent nor both an existent and non-existent action.
PINGALA COMMENTARY

8/9 A 'fixed deed' has already been refuted, as has a 'non-fixed deed', and a deed which is both fixed and non-fixed. Now, wishing to refute all these at once, he utters this verse. Therefore, a doer cannot do these three kinds of deed. Now, the three kinds of doer also cannot do a deed, and why?

CANDRAKĪRTI COMMENTARY

The very agent subject who is actual does not produce a non-actual product nor one both actual and non-actual. Why? Nagarjuna says ‘for the reasons already given’. As if there is no activity of production in an actual agent subject, an actual agent subject does not produce. Because of the difficulties adduced: ‘a non-actual product is not produced’; ‘such a product would be uncaused’; ‘if there is no causal principle there can be no cause and no effect’ - and so on. In short, a product both actual and non-actual cannot be produced. To quote again: ‘As to exist and not to exist are reciprocally contradictory how can they hold of one and the same thing?’ And so an actual agent subject can give rise neither to an actual product nor to one both actual and non-actual.

Now Nagarjuna says that a non-actual agent subject as well can produce neither an actual product nor one both actual and non-actual:
Kārikā VIII.10

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 10 - An incompleted doer also cannot create a
completed deed nor that of a completed-incompleted deed.
This is according to the reason expounded in previous
verses (i.e., verse 4, 5, and 6).

JONES (Skt):
[10] Nor, for the same reasons, does an actor who is not truly
real perform an action that is truly real or an action that is
not truly real and not truly real.

KALUPAHANA (Skt):
For reasons stated above, an agent who has come to be
non-existent does not perform an action that is existent
or both existent and non-existent.

MCCAGNEY (Skt):
Also no untrue agent does an act that is real or
both a real and unreal act for the reasons above.

NISHIJIMA (Skt?):
10. The unreal world does never produce the Real World,
The Real World and the unreal world are also two.
Doing something is just Action,
And before talking, we are also relying upon reasons.

SPRUNG (Skt):
10 A non-actual agent subject does not give rise to an
actual product nor one both actual and non-actual
for the reasons already given.

STRENG (Skt):
10. The non-real producer does not produce a product
which is not real, nor both real-and-non-real, Because of
the reasons which have been advanced earlier.

BOCKING (Ch):
8v10 A doer, whether fixed, or non-fixed,
Or both-fixed-and-non-fixed.
Cannot do a deed.
Those errors have already been explained.

BATCHelor (Tb):
One who does not exist as an actor does not do what
exists as an act and what neither exists or not [as an
act], because of what was demonstrated by the proof
above.

DOCTOR (Tb):
That which is not an agent
Does not perform any action,
Or something that both is and is not an action.
The arguments have already been given. [VIII.10]

GARFIELD (Tb):
10. A nonexistent agent
Does not perform an action that
Is unreal or both real and unreal
As we have already agreed.

GARFIELD-SAMTEN (Tb):
10. That which is not an agent with activity
Does not perform that which is an action
Or that which is and is not.
We have already presented the arguments.

HAGEN (paraphrase):
8.10 Thus, a non-existent agent performs neither an
existent nor both an existent and non-existent
action.
PINGALA COMMENTARY

8/10 A doer, whether fixed, not fixed, or both fixed-and-not-fixed, cannot do a deed, and why? It is for the same reasons as the earlier kinds of error, which we should explain at length here. Thus, wherever you search for a doer and a deed, you will be utterly unable to find them.

Question. If you say that there is no deed and no doer, then you in turn fall into causelessness.

Reply. Deeds arise from causality. They are conventionally termed 'existent', but they have no fixed (nature), and are not as you describe them. Why is this?

CANDRAKĪRTI COMMENTARY

An agent subject who was not actual would be without causal efficacy (nirhetuka); so, because of the fallacy already given, if there is no causal principle there can be no cause and no effect', a non-actual agent subject cannot produce. It follows from the statement if there is no productive activity of an agent subject actual as such the agent subject would be without a product’ that an actual product is not produced. No more is a product produced which is both actual and non-actual: ‘As to exist and not to exist are reciprocally contradictory how can they hold of one and the same thing?’

And now Nagarjuna expounds how it is that even an agent subject who is, singly and jointly, both actual and not actual does not give rise to a product of such different attributes as to be both actual and non-actual.
Kārikā VIII.11

[Robinson states that this kārikā has no correlate in the Chinese translation.]

करोति सदसद्भूतो न सन्नासच्य कारकः।
karma tat tu vijānīyāt pūrvoktair eva hetubhiḥ ||11||

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 11 - A completed-incompleted doer cannot create either a completed or incompleted deed. That is to be known by the reason stated previously (i.e., Verse 7).

JONES (Skt):
[n] So too, for the same reasons, we should understand that an actor who is both truly and not truly real cannot perform an action that is both truly and not truly real.

KALUPAHANA (Skt):
An agent that has come to be both existent and non-existent does not perform an action that exists and does not exist. This too should be understood in terms of the reasons adduced above.

MCCAGNEY (Skt):
A true or untrue agent does not do a real or unreal act. This too is understood from the reasons above.

NISHIJIMA (Skt?):
11. The Real World and the unreal world are working, Reality and unreality both are never producing anything. Action itself is also some kind of theory or dogma, And before discussions, there is some kind of problem, which should be considered theoretically.

SPRUNG (Skt):
11 An agent subject both actual and non-actual does not give rise to a product both actual and non-actual; this should be realized for the reasons already given.

STRENG (Skt):
11. And a real-non-real producer does not produce a product which is neither real nor non-real. This is evident from the reasons which have been advanced earlier.

BOCKING (Ch):
[n/a]

BATCHelor (Tb):
One who neither exists nor does not exist as an actor does not do that which exists and does not exist as an act. Here too this is to be known through the proof demonstrated above.

DOCTOR (Tb):
One that both is and is not an agent Does not perform an action or a nonaction. Here as well it should be understood That the arguments have already been given. [VIII.11]

GARFIELD (Tb):
11. An existent and nonexistent agent Does not perform an action that Is unreal or both real and unreal As we have agreed.

GARFIELD-SAMTEN (Tb):
11. That which is and is not an agent Does not perform That which is and is not an action. This also should be understood from what has been presented earlier.

HAGEN (paraphrase):
8.11 An agent that is both existent and non-existent does not perform an action that both exists and does not exist. This too should be understood for reasons stated in verse seven.
The reference is ‘As to exist and not to exist are reciprocally contradictory how can they hold of one and the same thing?’ So an agent subject both actual and not actual does not produce anything. It follows from the statement ‘If there is no activity of production in an actual agent subject as actual agent subject does not produce’ that an actual product is not produced. Nor is a non-actual, uncaused product produced because of the fallacy given in the statement ‘If there is no causal principle there can be no cause and no effect.’

Conclusion: the self-existence of things is without sense

In this way, in both the homogeneous form of the thesis and in the heterogeneous form, the existence of both the agent subject and his product his doing, his deeds is, however taken, without sense. It follows that what was said earlier, namely, ‘The compound elements of existence consciousness and the rest — do exist in fact it being their nature to exist as compounded; this is because their cause, the agent subject and his doing, exists in fact’ (fn 10 P. 115. The opponent’s view.) does not make sense.

You may ask: Do you assert positively that things do not exist? Indeed we do not. But for you, who hold the view that things have their being in themselves, the rejection of all things as real becomes possible just because they are denied self-existence. We, however, because things arise in dependence, discern no self-existence in anything at all. Of what then would we deny self-existence (fn 11 This puts the Madhyamika position succinctly: he is not a disillusioned realist, therefore he is not a nihilist.).

As is said in the Ratnavali: ‘One who takes a mirage to be water and who, arriving at the spot, persuades himself that the water is non-existent, is befuddled. The basic illusion is to hold that the personal world, this mirage, either exists or does not exist. So long as this illusion persists there is no freedom. At first the imaginings of ignorance, later the disclosure of the truth of things. If one does not insist on the reality of things what could their unreality be?’

This being so, how could the existence of things, whose nature is to be without self-existence, be established in any of the three ways? So, Nagarjuna says, it is by succumbing to conventional misbelief and accepting the real dependence of one thing on another, and not in any other way, that the existence of everyday illusory things, which are thought constructs like the water of a mirage, becomes acceptable.

KALUPAHANA COMMENTARY

While VIII.8 utilized the present participle to refer to the agent, the present verses employ the past participle: (i) an agent who has come to be existent (sadbhuta); (ii) an agent who has come to be non-existent (asadbhuta), and (iii) an agent who has come to be both existent and non-existent (sadasadbhuta). VIII. 10 is not found in the Chinese version.

GARFIELD COMMENTARY

11. Nāgārjuna now moves to assert his positive position on this matter: Agent and action are interdependent. Neither is logically or ontologically prior to or independent of the other. What it is to be an agent is to be performing an action. What it is to be an action is to be the action of an agent:
**Kārikā VIII.12**

**ENGLISH TRANSLATIONS**

INADA (Skt):
Verse 12 - The doer is dynamically related to the deed and the deed to the doer in order to arise. We cannot perceive any other cause for their establishment or completion.

JONES (Skt):
[12] An actor is dependent upon an action, and the action proceeds dependent upon an actor - we cannot see any other way to establish them.

KALUPAHANA (Skt):
An agent proceeds depending upon action and action proceeds depending upon the agent. We do not perceive any other way of establishing [them].

MCCAGNEY (Skt):
The agent depends on action and that depends on an agent. We see no other established reason action sets in motion.

NISHIJIMA (Skt?):
12. The truth is just Doing, that is the Real Truth, which is the Action itself. That is just the Real Truth and Doing something. The Action does never pervade into the different area, And it is looking for the methods to get the Highest Happiness actually.

SPRUNG (Skt):
12 An agent subject can be held to exist only on the presupposition of a product, and a product can be held to exist only on the presupposition of an agent subject. We discern no other basis for establishing their existence.

STRENG (Skt):
**12. The producer proceeds being dependent on the product, and the product proceeds being dependent on the producer. The cause for realization (i.e. Nirvana) is seen in nothing else.**
PINGALA COMMENTARY

8/11 A deed is non-fixed from the beginning. A deed originates because of a person, and by virtue of the deed, he is a 'doer'. The doer is not fixed, it is because there is a deed that he is designated a 'doer'. It is through the combination of these two elements that deed and doer are established. If something arises from a combination then it has no self-nature, and having no self-nature it is empty. Because it is empty there is nothing which is produced, but in accordance with the thinking of ordinary unenlightened people we make distinctions, saying 'there is a deed' or 'there is a doer'. But in the highest sense there is no deed and no doer. Moreover:

CANDRAKĪRTI COMMENTARY

That is because an agent subject who is unrelated to a product cannot be productive; but an agent subject related to a product is productive. There is no product something done not resulting from the activity of an agent because the term product is reserved for what is produced or done. The product exists as such in dependence on the producing agent. In this way, except for a proof of the existence of agent and product which depends on their reciprocality (parasparapeksa), ‘We discern no other basis for establishing their existence.’

Extension of conclusion to all things

The idea that the proof of the existence of agent and product depends on their reciprocality Nagarjuna extends to other things.

KALUPAHANA COMMENTARY

After criticizing the metaphysical interpretations of agent (karaka) and action (karma), Nagarjuna gives a positive description of both in terms of the principle of "dependent arising" (pratityasamutpada). Indeed, a more positive assertion such as, "We do not perceive any other way of establishing [them]" (nanyat siddhikaranam pasyamah), is rarely met with in the Karikas.

ENGLISH TRANSLATIONS

INADA (Skt):
Verse 13 - Thus, by way of the refutation of the (static concepts of the) doer and the deed, the concept of seizing or clinging (upddana) can be known. And basing the analysis on both the doer and the deed, various other entities (i.e., phenomena) can be understood.

JONES (Skt):
[13] From this dependency, we should grasp the abandonment of the ideas of “actor” and “action.” Through this analysis of “actor” and “action,” all remaining entities should be understood.

KALUPAHANA (Skt):
Following this method of the rejection of agent and action, one should trod stand grasping. The remaining existents should be critically examined in terms of the concepts of action and agent.

MCCAGNEY (Skt):
Thus from the “rejection” of the agent and of actions and agents, the method for knowledge of clinging and all the rest about beings should come to light.

NISHIJIMA (Skt?):
13. Therefore giving up some kinds of sacrifices, And leaving from giving up we get some parts jobs by ourselves, Relying upon the assistances, or the alternates, The left parts of existent works, might be solved as far as possible.

SPRUNG (Skt):
13 One should grasp the factors of personal existence in the same way by giving up the idea of the agent subject and his doing. One should think of all other things on the model of agent subject and his doing.

STRENG (Skt):
13. In the same way one should understand the "acquiring" (i.e. of karma - upadana) on the basis of the "giving up," etc. of the producer and the product. By means of this analysis of the product and the producer all other things should be dissolved.

BOCKING (Ch):
8v12 In the same way that we negate deed and doer, So (we refute) reception and the recipient. All other dharmas too Should be negated thus.

BATCHelor (Tb):
Likewise, one should understand clinging, because act and actor are dispelled. Remaining things too should be understood by means of actor and act.

DOCTOR (Tb):
Appropriation should be understood in the same way, As here action and agent have been excluded. Agent and action will provide Understanding of the remaining issues. [VIII.13]

GARFIELD (Tb):
13. From this elimination of agent and action, One should elucidate appropriation in the same way Through action and agent All remaining things should be understood.

GARFIELD-SAMTEN (Tb):
13. One should understand appropriation in the same way, Following the elimination of agent and action. Through action and agent All remaining things should be understood.

HAGEN (paraphrase):
8.13 Thus, as action and agent are refuted, should grasping be understood. By means of this analysis should all things be understood.
PINGALA COMMENTARY

8/12 Just as deed and doer cannot be separated from each other and, not being separable, are therefore non-fixed, and having no fixed (nature) therefore have no self-nature, so it is with reception and the receiver. Reception stands for the body of the five skandhas; the recipient is the person. There are no five skandhas apart from the person, and no person apart from the five skandhas, which merely arise from causality. Just as with receiving and the recipient, so it is with all other dharmas, which should be negated in the same way.

CANDRAKĪRTI COMMENTARY

13abc One should grasp the factors of personal existence in the same way by giving up the idea of the agent subject and his doing.

‘In the same way’ refers to the immediately preceding terms ‘agent subject’ and his ‘product’. ‘Factors of personal existence’ (upadana) means appropriation (upatti). Nagarjuna uses the expression ‘factors of personal existence’ as a synonym for the activity of appropriation. This, in its concrete realization, embraces the agent subject as appropriator and his doing as the appropriating. Precisely as for agent subject and his doing the appropriator and what is appropriated can be established as reciprocally dependent, but not as self-existent. They cannot be established as self-existence because of ‘giving up the idea of the agent subject and his doing’. The quotation marks indicate the reason; ‘giving up the idea’ means renouncing. The sense of the verse can be given thus: It should be understood that the reasons for rejecting the appropriator and what is appropriated are precisely those given for renouncing the agent subject and his doing. But it should be understood that the refutation of the agent subject and his doing is not the proof that only these two are reciprocally dependent, but further, that

13d One should think of all other things on the model of agent subject and his doing.

‘One’ means the wise man. The wise man, seeking freedom for the sake of release from the bonds of birth, ageing and death, having discredited the self-existence of agent subject and his doing would realize that they can be established only in utter dependence on reciprocality. ‘All other things’ are all those things without exception other than agent subject and his doing and appropriator and what is appropriated, such as, what is born and what gives birth, what moves and movement, what is seen and seeing, the subject of attribution and attributes, what is produced and the producer; and as well whole and part, quality and substance, means of knowledge and object of knowledge.

A detailed investigation of these topics can be had in the Madhyamakavatara and other works. You may think it is not necessary to mention appropriation a second time as the phrase ‘One should think of all other things’ comprehends both appropriation and appropriator. This is true, yet for the purpose of making clear their importance for the investigation into the way things truly are they are mentioned separately. Indeed, in the chapters still to come there will be repeated investigation of these two terms.

KALUPAHANA COMMENTARY

Nagarjuna began the chapter with the problem of grasping (upadana). If he were to accept the substantialist notions of agent and action, he could not explain grasping. During the course of this chapter, he was able to the metaphysical (and, therefore, unacceptable) implications of the substantialist views such as the denial of moral responsibility and freedom. The abandoning (vyutsarga) refers to the giving up of such metaphysical views. After giving up such metaphysical views, he presented an alternative view, namely, dependent arising of both agent and action (VIII. 12). Such a view allows for a satisfactory explanations of "grasping" (upadana). A life with reduced grasping contributes to worldly fruits such as the attainment of "heavenly" bliss. The complete elimination of grasping culminates in perfect freedom (moksa) or the ultimate fruit.

This does not mean that Nagarjuna has no conception of an agent or an action or moral responsibility or freedom. It is merely the renunciation of wrong views and the adoption of more appropriate explanations of these phenomena. Such explanations, Nagarjuna concludes, should be extended to all phenomena.
13. By “appropriation,” Nāgārjuna indicates any cognitive act by means of which one takes an attribute or entity as one’s own, or as part of one’s self. That includes the grasping of the aggregates as the self or of one’s mental states as part of one’s identity or of one’s possessions as central to one’s being. Appropriation in this broad sense is, hence, a central object of concern for Buddhist philosophy and psychology, and the relation between the appropriator and the act of appropriation is an important object of analysis. For in many ways the self that is constructed through appropriation presents itself as the subject of appropriation. But it is merely constructed, and its substantial reality is illusory. Then what indeed does the appropriation? And where there is no appropriator, how does appropriation occur? Nāgārjuna here suggests that this account of the relation between agent and action provides a model for understanding that relation. That is, this analysis provides a perfect paradigm for understanding the nature of subjectivity. In all cases of the relation between an agent of any kind and an act of any kind, the identity of the two will be seen to be mutually dependent, and each will come out as conventionally real, though not as inherently existent. We will see this paradigm articulated over the next five chapters as Nāgārjuna argues that we cannot make any sense of the self as an entity independent of its actions, perceptions, and interactions. Nor can we make any sense of the ontology of these phenomena as independent of the subject. This is a natural extension of the analysis of emptiness of the external world and demonstrates Nāgārjuna’s determination to treat all phenomena on the same basis.
Chapter IX

पूर्वपरीक्षा नवमं प्रकरणम्।

中論観本住品第九(十二偈)

pūrvaparīkṣā nāma navamaṁ prakaraṇaṁ ||

Chapter IX: Examination of the Prior Entity
OUTLINE:

We have now completed the discussion of the selflessness of phenomena. The second part of the section on the distinct explanations of the selflessness of phenomena and the selflessness of the person is the explanation of the selflessness of the person. It has two parts: the refutation of the essential existence of the person and the refutation of the argument for the essential existence of the person. This chapter is the first of these two parts.

EXPLANATION:

The first section has two parts: presenting the opponent's position and its refutation.

SUMMARY:

Having ascertained that if that to which the statements, “the appropriator of this body is this person” and “that which is appropriated by this person are the phenomena,” refer existed as they are grasped—as existing inherently—and were not merely posited by nominal convention, then there could not be any convention with regard to appropriator and appropriated, one should contemplate the consistency of these two in virtue of their being merely nominally imputed and dependently originated.
INADA (Chapter Introductions)

CHAPTER IX - Examination of the Antecedent State of the Self

The chapter examines the antecedent state of the self (atman). It can be conveniently analyzed in terms of the upadatr (subject, perceiver, percipient) and the upadana (act of perceiving, seizing, clinging, or perception).

The distinction actually issues forth another term in the process involved which is that of upadeya (the perceptual realm). From the above it is clear that upadatr and upadana are internal elements or aspects in the perceiving function while upadeya gives an external spread of such a function. And the total process is a triadic relationship. The Madhyamika standpoint here is to destroy the wholly formal, logical, or conceptual notions concerning the process involved in perception. Thus the examination is not solely restricted to former states of the perceiver but also concerns with the present and future states. This is the import of the last verse.

KALUPAHANA (CHAPTER OVERVIEWS)

g. Antecedent state (of the self) (purva). If there were to be no substantial action and agent, except the empirically given action and agent which are the results of dependence, how is it that metaphysicians came to assume the existence of such an eternal self or personality?

In Chapter IX, Nagarjuna undertakes to show how the belief in a permanent and eternal entity arises as a result of the recognition of the existence of a personality prior (purva) to his experiences such as seeing, hearing, and feelings (IX.1). In other words, the Buddhist metaphysicians, following a method similar to that adopted by Descartes in Western philosophy, were positing a substantial entity and then proceeding to attribute the functions of seeing and hearing to that entity. It is hard to believe that a philosopher like Nagarjuna was unaware that the Buddha’s notion of non-substantiality (anatman) was the direct result of his rejection of such a perspective, very clearly expressed by the Buddha in a passage in the Sutta-nipata: “Let him destroy the entire root of obsession, [namely, the belief] ‘I think, [therefore] I am,’’ (manta asmiti).80

This indeed is an unequivocal rejection of the “cogito ergo sum” (manta asmi) which contributed to the substantialist thought of the Upanisads as well as later Indian thought. Nagarjuna’s arguments shows how self-destructive such an assertion is. The implication of this assertion, as Nagarjuna perceives, is that such a personality has to be separated from the experiences that emerge subsequently. Nagarjuna wants to know how such a personality could be made known (parjnapyate) independent of such experiences (IX.3) thus implying that the sum (aham asmi) is dependent. If these experiences can be separated from the personality, it follows that they could occur even without such a personality (IX.4).

Having explained certain other implications of this metaphysical position, all of which he considers to be unsatisfactory, Nagarjuna maintains that with regard to such a personality the concepts of existence and non-existence are not validly applicable.
BATCHELOR (POETIC “TRANSLATION”)

Already

Am I already here
Before I see and taste and feel?
If not, how could I see and taste and feel?
How can I know if I’m already here or not?

If I were here without them,
They could be here without me.
I reveal them and they reveal me.
How can they be here without them?
How can they be here without me?

I am not already here
Before experience as such:
Seeing reveals just the seer,
Tasting just the taster,
Feeling just the feeler.

If I’m not already here before them all,
Could I be here before each one?
Can the seer taste?
Can the taster feel?

Were they different,
I would be legion.
Nor am I tucked inside the elements
Whence seeing and tasting and feeling unfold.

If to whom these things belong
Cannot be found,
How can they be found?
I do not precede them.
Nor am I with them.
Nor do I follow them.

Let go of “I am.”
Let go a of “I am not.”

JONES (COMMENTARY)

9. The Prior Entity

This chapter tackles the issue of an entity or person existing prior to the property or act by which it gains an attribute - e.g., there can be no “mover” existing prior to the act of moving by which he or she becomes labeled “a mover.” A “cause” cannot exist prior to its “effect” since it is labeled “a cause” only in its relation to an effect. Nagarjuna’s argument involves the interconnection of concepts and also the claim that different labels make different entities (w. 8-9) - e.g., a “seer” is not a “hearer” - which, he argues, would follow from a self-existence metaphysics.

GYAMTSO (COMMENTARY)

An Examination of What Comes First

In the sutras, the Buddha taught:

Composite things are empty of the self of the individual and the self of phenomena.

And:
Sentient beings do not exist, so no life force can be found either—
These phenomena are like bubbles of foam and banana trees,
Like illusions, like lightning in the sky,
Like water-moons, like mirages.

THE WORDS IN THIS SECOND VERSE are beautiful—it would be very good if you memorized it.

In this chapter, Nagarjuna will explain these passages and prove their validity with logical reasoning. Nagarjuna composed this chapter in answer to the members of the five out of the eighteen sub-schools of the Shravakayana that claimed that the “self of the individual,” meaning the self of the individual sentient being, substantially exists (in The Shravakayana (vehicle of the hearers) and the Pratyekabuddhayaana (vehicle of the solitary buddhas) compose the Hinayana, the foundational vehicle of Buddhism, whose views and practices are based on the first turning of the wheel of Dharma.). Nagarjuna analyzes the self of the individual and shows that it does not substantially exist, but rather is a mere appearance that manifests due to the coming together of causes and conditions.
This chapter contains many logical reasonings that refute the view that the self exists substantially. The twelfth and final verse summarizes them all in the following way:

The one who experiences perceptions does not exist before, during, or after the experiences of seeing and so forth.

Knowing this, all thoughts of an experiencer of perceptions either existing or not existing are reversed.

The one who sees form cannot exist before—that is, independent of—the experience of seeing the form, for if she did, it would absurdly follow that she would always see that form. The reason for this is that if an individual is called a “seer of form,” it is obviously because she actually sees some form, and thus if the seer of form existed independent of the experience of seeing it, the self who was called the seer of form would always see the form in order to earn that name. The same would be true with the other objects of the senses and the ones who experience them—if the experiencer existed before the experience itself, it would follow that the experiencer would always have that experience. Thus, if the hearer of a particular sound existed before the hearing of it, then that individual would always hear that sound. If the smell of a particular smell existed before experiencing the smell of it, then that individual would always smell the same smell. If the taster of a particular taste existed before tasting it, then that self would always taste the same taste. Finally, if the experiencer of bodily sensation existed before the feeling of it, then that individual would always experience that same sensation.

Therefore, no self can exist before the perceptions of forms, sounds, smells, tastes, and tactile sensations it experiences, because if it did, and it were one self, then it would be the seer of form before it saw anything, the hearer of sound before it heard anything, the smell of odors before it smelled anything, and so forth. It would be having all of the future experiences at once because it would be the experiencer of all those experiences before it experienced them. If it so happened that the experiencers of the different perceptions were different from each other, then if all of those existed before the experiences themselves, there would be that many selves existing at the same time in one individual, which would be illogical.

Furthermore, if the self who sees something existed after the experience of seeing ceased, there would be a self who sees without any seeing occurring, which would also be logically impossible. Finally, if the self who experienced perception existed only at the same time as the sense perception and not before or after it, that self would just all of a sudden come into existence at that moment of perception and then would cease to exist once that moment was over.

Someone might say, “Even if the experiencer of any particular perception does not exist before the experience of it, but rather at the same time it occurs, it does not mean that the self who is the experiencer just came into being at that very moment, because in one moment the self may be the experiencer of form, then in the next moment the experiencer of sound, and so forth.”

The question then becomes, is the self who is the hearer of a sound in one moment the same as or different from the self who is the seer of a form in the next moment? If it were the same self in both moments, meaning that the self with all its qualities were the same from moment to moment, then again there would be the logical flaw that the self who had the quality of being the one that saw a form would exist before that experience of seeing that form occurred. On the other hand, if the selves in each moment were different from each other, then in each moment there would be a completely different self who would instantaneously arise and cease and would have no connection with any of the selves that came before or after it. This, however, would totally contradict our notion of the self as continuing its existence over the entire period of this life, not to mention past and future lives. Therefore, this argument is also illogical.

Thus, the self cannot truly exist before, during, or after the experience of perceptions; but then, what is the self who appears to experience things? It is a dependently arisen mere appearance, just like the self who appears to experience things in dreams. When we analyze this self we cannot find it, so we cannot say that it exists, and since there is a mere appearance of it, we cannot say that it is completely nonexistent either. Therefore, the true nature of the self is appearance and emptiness inseparable, beyond the fabrications of existence, nonexistence, and whatever else we might think it to be.

We should apply this line of reasoning to other aspects of our existence as well. For example, we need to ask, does the one who gives rise to faith exist before the faith itself, or not? Does the one who has wrong views exist before the wrong views, or not? If the self does exist before those experiences, is it one self or different selves? Examine this and see.

We can also apply this analysis to the life of someone like the great Dharma king Ashoka, who first did a lot of negative things and later did a lot of positive things. Did the one who performed positive actions and the one who acted negatively exist before those specific actions themselves? If the one who acted positively and the one who acted negatively did exist before those actions, did they exist at the same time, in the same individual as different selves? How did they exist?

If someone is going to go for refuge, we can ask the question, does the one who goes for refuge exist before the act of going for refuge, or not? If she does so exist, then do...
the self who goes for refuge and the self who has not gone for refuge exist at the same time, or not?

This is a very profound and subtle way to analyze, and it is also an easy way to analyze, so we should use it a lot! We can apply it to a worldly situation, to someone who is out of work and then gets work. There is the self who is out of work and then the self who gets work—are they the same self? Are the out-of-work self and the working self the same, or are they different? Does the out-of-work self exist at the same time as the working self, and if so, are they one and the same, or are they different selves existing at the same time? Or are they different selves existing at different times?

When we analyze in this way, we can come to an extraordinary certainty in the emptiness of the self of the individual and in the union of appearance and emptiness that is beyond conceptual fabrication. To put this into verse for you:

*When you think, “I exist” or “I don’t exist,”
That’s how you fall into realism or become a nihilist.*

*To know your true nature, think of a clear sky at night
And on a beautiful lake, a moon that shines so bright!
Appearance and emptiness, no one can separate—
This is how you have to meditate!*

Chapter IX

ตอนที่เก้า ตอนพิจารณา

Chapter IX: Examination of the Antecedent State of the Self

INADA (Skt): CHATER IX - Examination of the Antecedent State of the Self
JONES (Skt): 9. The Prior Entity
KALUPAHANA (Skt): Examination of the Prior Entity
MCCAGNEY (Skt): 9. Analysis of Prior Existence
NISHIJIMA (Skt?): [9] Examination of the Moment Just Before the Present (12 verses)
SPRUNG (Skt): Self as Subject of Perception
STRENG (Skt): Section 9 - An Analysis of "the Pre-existent Reality" (grasper and grasping) In 12 verses
ROBINSON (Skt): 9. the pre-existent.

BOCKING (Ch): Chapter 9 Contemplation of a substrate 12 verses
BATCHelor (Tb): Investigation of the Presence of Something Prior
DOCTOR (Tb): CHAPTER IX - Analysis of Prior Existence
GARFIELD (Tb): Chapter IX: Examination of the Prior Entity
GARFIELD-SAMTEN (Tb): CHAPTER IX - Examination of the Prior Entity
HAGEN (paraphrase): Chapter Nine - Examination of the Prior Entity
GOLDFIELD (Tb): CHAPTER 9: AN EXAMINATION OF WHAT COMES FIRST

PINGALA COMMENTARY

9/0 Question. Some people say;

CANDRAKĪRTI COMMENTARY

[Chapter X] The personalist thesis
Some may object that the kārikā in the previous chapter, ’One should grasp the factors of personal existence in the same way by giving up the idea of the agent subject and his doing’, does not make sense, because
